Æschynanthus pulcher, 726
Agapanthus umbellatus, 70
Agents, land, 27, 77, 491, 523, 537, 573
Ageratum cœlestinum, 134
Agriculture, Experimental, by Prof. Johnston, rev., 13; Welsh, 46; and science, 60, 107; and steam-power, 75, 140, 364, 365, 685, 717, 749; in Ireland, 153, 156; and geology, 169; its prospects, 285; and landlords, 284; in Belgium, 300; in Berlin, 316; of Lancashire, by Rothwell, rev., 430; and Chemistry, by Noad, rev., 487; definitions and explanations in, 616; Russian, 649; progress of, 11, 44, 685; in Cheshire, rev., 701; Mr. Mechi's lecture on, 763, 828; experiments in, 730, 746, 747
Agricultural chemistry, 393, 574, 637
Agricultural College, Cirencester, 521, 569, 809; prizemen at, 25, 425
Agricultural schools, 102, 541; for adults, 246, 505, 587, 771; orphan, 409; at King's Somborne, rev., 205; remarks on ditto, 267
Agricultural economy, 42, 73, 777
Agricultural education, 314, 334, 634, 684, 699, 809
Agricultural errors, 379
Agricultural confessions, 57
Agricultural labour, 217; value of, 266
Agricultural labourers, 10, 202, 284, 442, 637, 825; cottages for, 27; to lodge and board, 202; wages of, 235, 249, 281, 380; returns respecting ditto, 266, 284, 298, 331, 395; on the Duke of Richmond's estate at Huntley, condition of, 284; savings, 283; education of, 314, 334, 634, 684, 699
Agricultural memoranda, 76, 92
Air, electrical condition of, 151; and the soil, 505, 570, 585; fresh, 699
Airy's Lectures on Astronomy, rev., 359
Aissade (French implement for irrigating gardens), 340
Algæ, Kützing on, rev., 39; Nägeli on, rev., 103
Allardia tomentosa, 583
Allotments, 156, 283, 348, 363, 573, 617, 668, 700, 715, 729; rules for, 442; mismanagement of, 491; at Crowland, 557; tenant, 778; 828
Almanacks, gardeners', 134; farmers' 750
Amaryllis Acramanii, 357; Cape, 470
American plants, 371, 493, 755; Catalogues of, noticed, 598
American blight, 88, 408
American churn, 334, 413; description of, 269, 315, 317
American mode of preventing the Potato rot, 503
Amherstia nobilis at Ealing Park, 215, 824
Ammonia, effect of, on plants, 83, 804; use of, in plant-houses, 102
Anacharis alsinastrum, 580
Anahilt, farming in, 537
Analyses of guano, 222, 253, 270; of Potatoes, 316; importance of, 396; chemical, Normandy's Hand-book of, rev., 567
Anbury, 573
Anderson (Dr.), on the Course of Creation, rev., 615
Anemone, by Tyso, rev., 791
Angræcum fragrans, scent of leaves of, 599
Animals, 6; Professor Simond's Lecture on the Disease of the liver in, 460; diseases of, 494; bones of, dying under mortification, poisonous to plants, 795; dimensions and weights of, at the Smithfield and Birmingham shows, 793
Animal and vegetable kingdoms, adjustment of, 279
Animal food, price of, 12; increasing supply of, 173, 250, 299, 361
Animal heat, 678, 732, 779
Annuals, English names of, 422
Ants, 152, 278, 293, 373, 534; house, 340
Aphelandra cristata, 790
Aphis sexton, 35
Apples for espaliers, 648; for baking, 696; pips of, 760; of the Dead Sea, 582
Apple trees, 741; diseased, 173
Apprentice fees, 19, 38, 51, 54, 55
Apricots, Kaisha, 487; as standards, 551
Aquatic plants, 325; tanks for, 120; peculiar bodies which occur in Aldrovanda vesiculosa, Utricularieæ, and others, 597
Aquilegia glandulosa, soil for, 136
Araucaria imbricata, 325, 341, 456, 518
Arsenic, Wheat steeped in, 14, 30, 91; ditto, danger of, 62
Artichokes, Jerusalem, constituents of, 583; new, 792
Arts, useful, Turner on, rev., 199
Artificial manures, 25, 539, 650
Ash, to propagate, 422
Asparagus, to salt, 376, 390; culture of, 645
Asphalte floors, to make, 654
Asphaltic manure, 204, 269
Asplenium fontanum, 8
Association, British, 516, 532, 550, 564, 580, 597, 629, 644, 660, 677
Astronomy, Airy's lectures on, rev., 359
Atlas, Physical, Johnston's, rev., 22
Atmosphere, 339; of houses, hygrometer for regulating, 597; abnormal, observations on the growth of plants in the, 597
Atomic character of the food manufacture, 141
Auchness farming, 155
Aviaries and rats, 22, 166, 197
Azaleas, list of hardy, 56; guano for, 277; hybrid, 293; to propagate, 296

B.

Bacon, 78; to smoke, 557
Balsams, 420
Bamboo, the, 70
Bantams, black sickness in, 270
Bark, price of Larch, 408; medical use of that of Adansonia, 631
Barley, Peruvian, 126, 652; varieties of, 173
Barometer, 484
Baths, leaking in, 374; remedy for, 389
Beans, select, 84, 117; kidney, 116
Beck's (Mr.) garden noticed, 263
Beef manufacture, 121
Beer, to correct acidity of, 46, 109, 140, 141, 156, 172, 220; to make from sugar, 605
Bees, to feed, 120, 165, 198, 200, 214, 216, 229, 262; profits of, 187, 341; to unite, 261, 501; remedy for sting of, 422, 437, 518; drone, 453; to remove, 696
Bee-keeper, 165
Beehives, 264, 277; to weigh, 392
Beetle, sawyer (Prionus cervicornis) 343
Beetle traps, 376
Begonias, 134
Belgium, agriculture in, 300
Benefit societies for gardeners, 86
Berberries, evergreen, 71
Berberis Bealei, 212
Berlin farming, 316
Bhotan, vegetation of, 504
Biddulph moor, district of, 343
Bignonia Tweediana, 805
Birch roots, bleeding of, 245, 259, 277; cure for, 278
Birds, 39; instinct of, 453; destructive in gardens, 87; food of, 102, 118, 150, 198, 213, 229, 243, 293, 396; nests to make, 134; swallows, early, 245; cuckoo, 325, 390, 406, 422, 437, 453, 486, 501, 518, 550, 804, 820; swans, food of, 421; British song, 645, 660, 676, 692, 708, 724, 740, 757, 772, 773, 788, 820; Peas, to protect from, 759; preserving skins of, 776
Blight, American, 88, 408; Wheat, 492, 797
Bodorgan Hall, gardens at, noticed, 583
Bog cultivation, 586
Bones, directions for applying, 171; adulteration of, 395; to prepare for manure, 492; to steam, 700; of animals, dying under mortification, poisonous to plants, 715
Books Reviewed:—Episodes of Insect Life, 7, 807; Paul's Rose Gardens of Hertfordshire, 7; Johnston's Experimental Agriculture, 13; Johnston's Physical Atlas of Natural Phenomena, 22; Gray on Plants of the United States, 23; The Steed, by Harry Hieover, 29; Kützing's Algæ, 39; Huxtable, on present prices, 41, 46; Weddell on the Cinchona Forests, 55; Cabinet Lawyer, 71; Parson's Address at the Newhaven Horticultural Society, 87; Brodie's Land Burdens, 92; Morton's Cyclopædia of Agriculture, 93; Nägeli's Algæ, 103; Caird on High Farming, 105; ditto Harrowed, 477; Paxton's Flower Garden, 135; Gardeners' Almanack, 134; Young on Wire Fencing, 135; Wheeler's Catalogue of Seeds, 135; Caird's Plantation Scheme, 141, 153; Turner on Useful Arts, 199; Mrs. Osborne's Oceanus, 199; Howell's Unity of Nature, 199; Account of the King's Somborne School, 205, 267; Sirr on China, and the Chinese, 231; Adult Schools in Agricultural Districts, 246; Johnson's Dairy and Cowkeeper, 253; Loudon's Encyclopædia of Gardening, 263; Laws on the Drainage of Clays, 285; Statistical Companion for 1850, 295; Dixon's Ornamental and Domestic Poultry, 301; Heiress in her Minority, 343; Airy's Lectures on Astromony, 359; Lawson's Treatise on Grasses, 366, 407; Sutton's Seed List, 366; Moore's Treatise on Grasses, 407; Hieover's Practical Horsemanship, 413; Moore's Handbook to the Glasnevin Botanic Garden, 423; Finchley Manual of Industry, 423; Frazer's Handbook for Ireland, 423; Kunth's Enumeratio Plantarum, 423; Rothwell's Lancashire Agriculture, 430; Loudon's Hortus Britannicus, 438, 453; Supplement to ditto, 456; Word in Season, or a pamphlet on Corn Growing, 445; Wood's Tourist's Flora, 455; Gray's Botanical Text Book, 471; Ireland's Only Safety Improvement of its Waste Lands, by Rawstorne, 477; Bushnan on Cholera and its Cures, 487; Noad's Chemistry and Agriculture, 487; Griffith's Posthumous Papers, 535; Burn on Practical Ventilation, 551; Normandy's Handbook of Chemical Analysis, 567; Hooker and Arnott's British Flora, 582; Knight and Perry's Synopsis of Coniferous Plants, 598; Mr. Hosea and Mr. John Waterer's Catalogues of American Plants, 598; Paul's Catalogue of Trees and Shrubs, 598; Comstock, Ferre, and Co.'s Catalogue of Garden Seeds, 598; Cuthill's Instructions on the Potato, &c. 611; Anderson's Course of Creation, 615; Milne on the Farms of Rigden, Huxtable, and Morton, 665; Kemp on Laying out small Gardens, 675, 693; Evans' Sugar-Planter's Manual, 694, 710, 726; Wray's Practical Sugar Planter, 694, 710, 726; Scoffern on the Manufacture of Sugar, 694, 710, 726; Report on Scoffern's Patent for Refining Sugar, 694, 710, 726; Agriculture of Cheshire, 701; Chubb on the Construction of Locks and Keys, 743; Sowerby's Popular Mineralogy, 743; Illustrated Book of Songs for Children, 743; Rutter's Account of the Electric Indicator, 743; Morris on British Birds, 743; Description of Palmyra Palm of Ceylon, 743; Cruikshank's Stop Thief, 743; Rendle's Price Current, 743, 758, 774; Farmer's Almanack, 750; Macpherson on Waterer's System of Growing Rhododendrons, &c., 755; Gardiner on British Mosses, 791; Tyso on the Anemone, 791; Roberts's Voices from the Woodlands, 823; White's History of Mammalia, 823
Borassus gomutus, uses of, 311
Borecole, select, 276
Boronias, 133
Botany, spread of, 499
Botanic Gardens, Sydney, 53, 728; Calcutta, 71; Cambridge, 436, 438, 518; Edinburgh, 790, 806
Botanical, nomenclature, 387, 403, 405, 407, 421, 422, 437, 467, 469, 483, 501, 533
Botanical Text Book, by Dr. Gray, rev., 471
Bowes Manor noticed, 631
Box feeding, 378, 381, 412, 413, 450
Bran, a manure for Turnips, 413
Bread, weight of, 540; ropy, 660; modern, worthless, 762
Brewing, 187
Brick and tile manufacture, 122, 138, 186
British Association, 516, 532, 550, 564, 580, 597, 629, 644, 660, 677
British Museum, 275, 307
British Flora, Hooker and Arnott's, rev., 582
Broccoli, select, 117
Brodie on Land Burdens, rev., 92
Browallia Jamesonii, 662, 678
Brugmansias, double white, 262; culture of, 277; suitable for conservatory beds, 774
Brunsvigia Josephinæ, 581
Buckingham Palace, alterations in front of, 595
Buddlea globosa, 56

87138

Bug bites, 487; remedy for, 534
Building for the Exhibition of 1851, 451, 453
Buildings, farm, 283, 540; iron and glass, 792
Bulbs, culture of, in open borders, 709; ditto for flowering in pots, or turning out in the borders early in spring, 709; Cape, 470; in water, 806
Burn on Practical Ventilation, rev., 551
Burning clay, 136
Bushnan on the Cholera and its cures, rev., 487
Butter, bad, 78; boiled, 157; Professor Way's lecture on, 251; rancid, 427

C.

Cabbages, plants for an acre, 220; Portugal, 630, 662
Cactuses, to prune, 296
Caird's High Farming, rev., 105; ditto Harrowed, rev., 477; Plantation Scheme, rev., 141, 153; and his works, 265; and his reviewers, 315
Calboa globosa, 23
Calceolarias seedling, 277, 292; malformed, 389
Calcutta Botanic Garden, Mr. Scott's appointment to, 71
Calico, glaze for, 216, 744
Callitriche, epidermal appendages of, 644
Calves, to rear, 92; to cure coughing in, 173
Cambridge Botanic Garden, death of Mr. Murray, curator of, 436, 438; new curatorship of, 518
Camellias, stem of, ringed, 3; to winter, 8; yellow, 67, 211; origin of the Archiduchessa Augusta, adv., 82; in the open air, 264
Canaries, nests for, to build on, 134
Canary seed, to sow, 190
Cannas, culture of, 88
Cape Amaryllids, 470
Cape Heaths, sale of, Mr. Epps', 456; Mr. Rucker's, 519
Carnations, select, 404; shows of, 406, returns, 484; to winter, 583; monstrous, 612; soil for, 744
Carrots, white Belgian, 238; how to obtain early, 789
Carts, 124; Cumberland, 28, 77, 171, 428, 475; Scotch, 76; *v.* waggons in the harvest field, 621
Catalogues, florists', 342
Caterpillars, tissue woven by, 661
Cats, wild, 167
Cattle, to feed, 10, 121, 122, 138, 155, 170, 250, 283, 247, 765, 781, 828; to fatten, 27, 765, 781; increase of weight in, as compared with the consumption of food, 30; to feed on boarded floors, 107, 187, 353, 654, 794; to box feed, 278, 381, 412, 413, 540; breeds of, 137; Jersey, 236; diseases of, 381; water for, 429; Professor Simond's lecture on the Diseases of the Liver of, 460; short-horned, 490; cure for epidemic in, 542; Cow Parsnip as food for, 523, 556, 573; summer crops for, 574; cure for mange in, 670; dimensions and weights of those at the Smithfield and Birmingham Shows, 793
Cattle Insurance Company, 187, 220, 446, 457, 477
Cattleyas, varieties of the ruby lipped, 663
Cauliflowers, in pots, and toll-gates, 264
Ceanothus papillosus, 277; dentatus, 277; rigidus, 277.
Ceci, or chick Peas, 518
Cecidomyiæ of the Willow and rock Rose, 599
Celery, Mr. Cole's, 39, 54; value of white, 118; select, 165, culture of, 373
Cement for cisterns, 408
Cemonus unicolor, 35
Cereus, night blowing, 501
Chaff, cutting of, and Oat bruising, 828
Chaff cutters, 780; and Turnip, 443
Chalk, as a top dressing, 750
Chara vulgaris, 645
Charcoal, peat, 373, 436, 697, 715, 741, 758, 778; of human excretæ and peat, as manure, 637
Chatsworth, Victoria Regia at, 70, 103, 228, 613; house for, at, 548
Cheese, chemical principles of making, 251; to pack, 206; Leicestershire, 410
Cheiranthus Marshallii, 225
Chemistry, Agricultural, 393; by Noad, rev., 487; study of, 574, 637; Normandy's Handbook of, rev., 557
Chestnut, Spanish, worthlessness of, as timber, 102, 133; to prune, 152
Chevreul's arrangement of flowers for February and March, 4; for May, 36; for June, July, and August, 116; for September, 165; for October, 181
Chick Peas, 518
Chicory, 334, 542; management of, 702
Chicory coffee, its history, manufacture, adulterations, and means of detecting them, 103
China and the Chinese, by Sirr, rev., 231
Chinese method of colouring green Tea, 23; mode of packing seeds, 84; Primulas, 135; Gardens, 372; Dahlias, 599; nursery gardens at Shanghae, 757; Moutan Gardens, 821
Chiswick, exhibitions at, 291, 323, 371, 451; report of ditto, 326, 374, 453; jottings at ditto, 325; judges at ditto, 326; visitors at ditto, 484; list of awards made at, for May, 322; for June, 370; for July, 450; schedule of prizes for 1851, 530, 531; temperature of, 806
Chloride of lime, a prevention for smut in Wheat, 651
Cholera and its cures, by Dr. Bushnan, rev., 487
Christmas Rose, 52
Chronicles of a clay farm, 57, 138, 233, 569
Chrysanthemums, culture of, 22, 230, 310; to plant, 181
Chubb on the Construction of Locks and Keys, rev., 743
Churn, American, 269, 334, 413, 315, 317; Samuelson's improved, 286
Churra Poonji, botanical news from, 694, 710
Cirencester Agricultural College, 521, 569, 809; prizemen at, 25, 425
Cisterns, material for, 248; cement for, 408; for purifying water, 438; iron, 598
Clay, burnt, 136; Drainage of by Laws, rev., 285; Grass seeds for, 286
Clay farm, chronicles of a, 57, 138, 233, 569
Climate, effect of, on plants, 753, 789
Climbers, 726, 773
Clod crusher, Cumberland, 77
Clover crop, 425, 458, 492; failure of, 491, 508, 537, 573, 588, 602, 621
Clover Dodder, 508
Coal-beds, burning, 261
Cochin China fowls, 779
Cock-chaffer and lawns, 678
Cockroaches, new breed of, 118; to kill, 328
Cocoa-nut sugar, 469
Coffee, Chicory, its history, manufacture, adulterations, and means of detecting them, 103; and Tea, &c., retained for home consumption, 442; duty on ditto, 442; use of, in Arabia and Abyssinia, 471
Cold, effect of, on plants, 820
College, Cirencester Agricultural, 521, 569, 809; prizemen at, 25, 425
Colocasia, 662
Colours, grouping of, 4, 36, 116, 165, 181; harmony of, 22; impaired by chloride of lime, 198; of flowers, alteration of, 244
Comstock and Ferre's catalogue of garden seeds noticed, 588
Conchology, Dr. Johnston's Introduction to, rev., 502
Conifers, hardiness of, 55, 518; list of, 100; sale of, 119; young, to protect, 293; for parks, 437; to graft, 776; catalogue of, in Journal of Horticultural Society, 806
Conroy's (Sir J.), farm noticed, 221
Conveyancing system in regard to land, 25
Cooper's (Miss), Rural Hours, 678
Corda (Dr.), death of, 323
Corn, Cobbett's, 28; spring, importance of sowing early, 155; transmutation of, 584; word in season on growing of, or a pamphlet on, noticed, 445
Corn weevil *v.* pitch, 10
Corn salad, 179, 196, 214
Cottages, labourers', 27
Cottage grate, 269
Cotton, 67; Gossypium, and the effects of climate in altering the character of, 645
Coverings, waterproof, 216, 744; mat and wooden shutter, 22
Cover for dung heaps, 570, 620, 650, 780
Cow-house and Vinery, 198
Cow-parsnip (Heracleum sphondylium), 523, 556, 573
Creation, Course of, by Dr. Anderson, rev., 615
Creepers, 726, 773
Cress, curious species of, 262; grounds at Erfurt, 261
Crocuses, 632
Crops, rotation of, 203, 345, 395; drilling, 380; Clover, 425, 458, 491, 492, 508, 537, 573, 588, 602, 621; in the north of Scotland, 470; for allotments, 491; returns of, 553, 554; summer cattle, 574; manure for every, 473, 490, 602
Cropping, a kitchen garden, 229; three years' course of, 231; table of, for 10 or 11 acres, 430
Cruikshank's Stop Thief noticed, 743
Cuckoo, the, 325, 390, 406, 422, 437, 453, 486, 501, 518, 550
Cucumbers, monstrous, 533, 581; to force, 597; cut, to keep, 822
Cultivator, steam, 140
Cumberland carts, 28, 77, 171, 428, 475; clod crusher, 77
Cupressus funebris, 228, 439; Uhdeana, hardiness of, 518
Curds, Turkish, to make, 6
Currants, to prune, 39
Cuthill's instructions on the Potato, &c., 611

Kirby (Rev. H.), death of, 435
Kitchen garden, to crop, 229
Knight and Perry's nursery, noticed, 503; their Synopsis of Coniferous Plants, rev., 598
Knowles' (Mr.), farm, noticed, 558
Koch (Dr.), death of, 156
Kohl Rabi, to sow, 141, 270
Kunth, (Prof.), death of, 247; his Enumeratio Plantarum, rev., 423
Kützing's Algæ, rev., 39

L.

Labour, spade, 203; agricultural, 217; value of ditto 266, 284, 298, 331, 395; Irish and its reward, 286
Labourers, agricultural, 10, 202, 284, 442, 637, 825; cottages for, 27; to lodge and board, 202 on the Duke of Richmond's estate at Huntly, condition of, 234; wages of, 235, 249, 281, 380; returns respecting ditto, 266, 284, 298, 331, 395; savings, 283; education of, 314, 334, 634, 684, 699, 809
Laburnum, to force, 134
Lælia superbiens, flowering of, 132
Lamp-black, a protective paint, 262
Land, Grass, to improve, 77; waste, 315; exhausted and green manure, 393; drainage improvement company, 489, 539, 541, 553; cultivation of, 620; ditto of bog, 586; permanent pasture, 621; Grass seeds for ditto, 156, 173, 638; investments in Ireland, 636; clay, 651; Grass seeds for ditto, 286; frozen, 678; warp of Lincolnshire, 713
Land Burdens, by Brodie, rev., 92
Landowner, report to a, 170; business of a, 173; right, 457; lesson to, 604
Land agents, qualifications of, 27, 77, 491, 523, 537, 573
Landlord, and tenant, 13, 43, 221, 251, 813; his part of agricultural produce, 284
Lapageria rosea, 566
Larch, to fell, 38, 86, 102; ditto in winter, 198; decay of, 709
Laurels, effects of the winter on, 469
Law, respecting damaging trees, 359; of hypothec, 377, 412; game, 345; conveyancing, 25; of patents, 803
Lawyer, the cabinet, rev., 71
Lawns, Grass seeds for, 72, 350, 824; to kill moss on, 120, 808; dressing for, 152; and the cockchaffer grub, 678
Lawson's Treatise on Grasses, rev., 366, 407
Layering, pots for, 646
Leases, 43, 345, 508
Leaves, fruit ripened without, 662
Leeks, culture of, 614, 741, 774
Lentils, 350
Lettuces, select, 117, 133
Leucoium vernum, 200
Libocedrus tetragona, 439; chilensis, 439
Lilies, Japan, 484, 696; water, gleanings about, 709; of the valley, 581
Lilium Wallichianum, 535
Lime for slugs, 380
Lime-kilns, to make, 574
Limonia laureola, 55, 71, 582
Limnæa stagnalis, 279
Lincolnshire warp lands, 713
Linen, Irish, 188
Liquid manure, 58, 59, 633, 699, 713, 794; tanks for, 93, 124, 537; effects of, on Roses, 87; economy of preparing and applying, 652, 669
Locusts in Savoy, 711
Loddiges, (Mr.), death of, 7; his sale, 132; nursery noticed, 519
Loudon's Encyclopædia of Gardening, rev., 263; Hortus Britannicus, rev., 438, 453; supplement to ditto, 456
Low's (Mr.) nursery noticed, 261
Lucerne, to sow, 141, 606
Luculia gratissima, 244
Lymexylon navale, 677, 726; effect of steam-kiln on, 470

M.

Mache, 179, 196, 200
Machines, moving, 214, 574; threshing, 220, 251
Machinery, water-wheel for farm, 203, 235; results of, 618, 634
Magnus (Prof.), on the nutrition of plants, 589, 605, 685
Mahogany trees, large, 262
Maize, Cobbett's, 28
Maize smut, 675
Malgwyn Castle, plan of heating frames at, 132
Mammalia, by White, rev., 823
Mandrake, 243
Manettii Rose stock, 373, 388
Mange, cure for, 670
Mango trees, 212
Mangold Wurzel, 540, 583, 700; weight of, 702
Manures, 44; artificial, 25, 539; metropolitan sewage company, 19; shed for, 28; gypsum as, 39; liquid, 58, 59, 633, 652, 669, 713, 794; tanks for ditto, 93, 124, 537; effects of ditto on Roses, 87; pond mud as, 118, 149, 166, 182, 201, 229, 278; for Vines, 119; and soils, Prof. Way's lecture on, 188, 331; waste of, 185; asphaltic, 204, 269; old tan as, 198, 232, 253, 270; hose for, 270; farm-yard, 317, 573, 651; economy of preparing and applying ditto, 652, 669; humus as, 234; sewage, distribution of, 326, 339, 341, 357, 358; economy of, 347, 538; application of, 382, 443, 697; value of, 379; green, 398, 698; for Turnips, 489; bran, as for ditto, 413; for every crop, 403, 602; to prepare bones for, 492; Heather as, 539; for Grass, 541, 798; heaps, 395, 704; shelter for ditto, 570, 620, 650, 780; philosophy of ditto, 635, 650, 669; fresh and fermented, 621, 684; long or short, 620, 700; absorption of, by earths and loamy soils, 634; value of human excretæ and peat charcoal as, 637; value of artificial, 650; soot as, 126; adulteration of ditto, 369; superphosphate of, 791
Manuring crops, 473, 490, 602; autumn, 761
Markets, corn and cattle, 668
Market gardens, Fulham, 279, 356
Masters and gardeners, advice to, 6; and servants, 666, 682

TO THE SUBSCRIBERS TO THE GARDENERS' BENEVOLENT INSTITUTION.—Your Votes are solicited for EDWARD BEACH, of Quedgely, near Gloucester, a very deserving old man, now upwards of 75 years of age. He has been all his life engaged in the gardening business; but, unfortunately, through losing a great portion of the little money he saved, is now dependent on charity. The favour of your Vote will be highly esteemed He is strongly recommended by Messrs. GARAWAY, MAYES, and Co., Durdham Down Nursery, Bristol; Mr. GEORGE WHEELER, Nurseryman, Warminster; and Mr. J. C. WHEELER, Kingsholm Nursery, Gloucester.

AMERICAN PLANTS.

HOSEA WATERER begs to announce he has just published a New and Complete Catalogue of his AMERICAN and CONIFEROUS PLANTS, which may be had on application, inclosing two stamps for postage to
HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

CUCUMBER AND MELON SEEDS.

CUTHILL'S EARLY SCARLET-FLESH MELON gained two Prizes this year, one at Chiswick, and one at Regent's Park; Snow's Green-fleshed Prize Melon, 2*s.* per packet, each. Cuthill's Early Black Spine Cucumber, the best for all purposes, see *Chronicle;* Snow's Superior White Spine Ditto, 1*s.* per packet, each sort, of 10 seeds; 20 seeds of best Marrow, 6*d.*; Lisianthus Russellianus, 1*s.* per packet; Lisianthus plants, very fine, from 2*s.* 6*d.* and 3*s.* 6*d.* to 5*s.* each; the various sorts of Strawberry plants, in pots, for forcing. Cuthill's Treatise upon the Potato, Strawberry, Cucumber, Melon, and Lisianthus, 1*s.*, or, by post, 1*s.* 4*d.* Cucumber Plants ready about the 1st of February.—JAMES CUTHILL, Florist, Camberwell, Surrey.

BENJAMIN R. CANT, St. John's-street Nursery, Colchester, has now ready for delivery, strong well-established plants of the following:
GERANIUM, HOYLE'S CRUSADER ... ... 7*s.* 6*d.* each.
„ TOPPING'S BRILLIANT ... ... 7*s.* 6*d.* „
FUCHSIA SPECTABILIS ... ... 7*s.* 6*d.* „
The Three for 18*s.*, carriage and package free to London. Post-office orders, or reference, requested from unknown correspondents. The usual discount to the trade.

QUICK FOR SALE.

SAMUEL COCKING, SEEDSMAN, &c., Biggleswade, has to dispose of a large quantity of WHITETHORN QUICK, of two years' growth, at 2*s.* 6*d.* per 1000, very strong. Ditto, three years' growth, at 4*s.* per 1000, delivered free within 20 miles.

NEW VERBENA, TURNER'S "MRS. MILLS."—The following opinion of the above is from Glenny's Garden Almanack: "This variety was exhibited at the Shacklewell Dahlia and Seedling Show, and at Birmingham, where it was awarded First Class Certificates. It is unquestionably the best formed of all we have seen in cultivation; the petals nearly touch each other at the outer edge, and the outline, though not perfect, is nearer to it than any we have seen; it is one of the colours that come near to blue." It is a beautiful pot plant, and equally desirable for bedding, being of close habit, free flowering, and fine foliage. Plants, in spring, 5*s.*—Royal Nursery, Slough.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall, and are warranted double, and of which large and choice roots are selected at 4*s.* per dozen. Also, expected, about the end of January, a choice collection of Orange, Lemon, Citron, and Shaddock Trees, together with Catalonian, Azorian, and Arabian Jessamine plants, any of which may be bespoke.—N.B. Orders by post punctually attended to.

MANNINGTON'S PEARMAIN.

JAMES CAMERON, NURSERYMAN and FLORIST, returns his best thanks to his friends and the public in general for their liberal support, and begs to say he has now for sale a sufficient quantity of the above valuable APPLE, and is thus enabled to offer them at so reduced a price as to ensure them extensive cultivation. It is a middle-sized variety, and different from any in cultivation, and remarkable for its rich sugary and aromatic flavour, superior in every respect to the Ribstone Pippin. It is in its height of flavour from January till the end of May, and a very good bearer. Strong dwarf maiden plants 5*s.* each; the usual allowance to the trade. Remittances from unknown correspondents, previous to the trees being sent, by Post-office orders, made payable to JAMES CAMERON, Nurseryman, Uckfield, Sussex.

J. C. has also an extensive stock of Fruit and Forest Trees, Quicks, Evergreens, and Roses of first-rate quality.

THE VERY BEST KINDS OF KITCHEN GARDEN SEEDS AT REDUCED PRICES.

*** *Carriage free to any railway or packet office in London or Bristol, or to any station on the Great Western, South-western, or South-eastern Railways.*

JOHN SUTTON AND SONS, GROWING THEIR SEEDS THEMSELVES, AND CAREFULLY PROVING ALL THE NEW KINDS AS SOON AS INTRODUCED, are enabled to supply the public with new Seeds of such quality as will prevent disappointment in the crops.

No. 1.—A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS, containing full quantities of the king of Peas, *Fairbeard's Surprize, Champion of England, Sutton's Early Champion, Sutton's Early Goliah, Burbige's Eclipse, and other superior kinds of Peas; as also the choicest Cucumber, Broccoli, Cauliflower, Lettuce, and all other kinds of Kitchen Garden Seeds, now in general cultivation, for the reduced charge of* 2*l.* 2*s.*

No. 2.—A COMPLETE COLLECTION, in smaller quantities, 1*l.* 1*s.*

No. 3.—A SMALL AND CHOICE ASSORTMENT, 12*s.* 6*d.*

*** Carriage free, as see above.

The ADVANTAGES offered to purchasers of either of the above Collections are, the BEST SORTS yet introduced, at MUCH LOWER PRICES than are usually charged for the old kinds of inferior quality. Should any article not be required it might be mentioned in giving the order, and increased quantities of others will be given in lieu of those to be omitted.

MESSRS. SUTTON'S NEW SEED CATALOGUE will be forwarded free by post on receipt of two penny stamps.

CHOICE FLOWER SEEDS sent free by post as follows:—The best 50 sorts, 12*s.* 6*d.*; the best 30 sorts, 7*s.* 6*d.*; the best 20 sorts, 5*s.*

Reading Seed Warehouse, Reading, Berks.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes	8*s.*	Early Manleys	7*s.*
*Early Round Frame	8*s.*	Early Cockneys	7*s.*
Early Ash-leaved Kidney	8*s.*	Fox's Seedling	7*s.*

Second Early Potatoes for Winter and Spring use:

American Native Potatoes	5*s.*	Kentish Pink Kidney	4*s.*
York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

CLERODENDRON BETHUNEANUM.

HUGH LOW AND Co. have much pleasure in offering the above-named most beautiful plant. It was introduced by them from Borneo, and is figured and described by Sir Wm. J. Hooker in the December Number of the Botanical Magazine. Strong established plants, 63*s.* each. A Catalogue of their general collection, stamped, and free by post; also a list of Vegetable and Flower Seeds, containing the best and most approved varieties, may be had on application.

Clapton Nursery, London, Jan. 5.

MESSRS. J. AND H. BROWN'S CATALOGUE for 1850, contains all that is new and useful in Exotic and Hardy Plants and Shrubs. Sent free by post for six stamps. Orders for any of the following will be executed as soon as the weather permits.

Albion Nursery, Stoke Newington, London, Jan. 5.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.—No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz. Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parenip, 2 oz. Savoy, 3 pkts. Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. ... £3 3 0
No. 2, two-thirds of the above ... 2 2 0
No. 3, one-third ditto ... 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden ... 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

CHEAP! CHEAP!! CHEAP!!!

CHARLES DALY AND SON beg to refer their friends and the public, who should be in want of cheap Thorn Quick, cheap Irish Yews, cheap Shrubs, cheap Forest Trees, and cheap Early Seed Potatoes at 5*s.* per bushel, to their Advertisement in the *Gardeners' Chronicle* of the 27th of October, and 3d and 10th of November last. Their Catalogue of Garden and Farming Seeds sent free by post, containing a good many of their own growing, which will be seen by their Advertisement.

They will also feel much obliged by their customers paying their last year's account, as they have no wish to put them to expense.—Coleraine, Ireland, Jan. 5.

COLE'S SUPERB SOLID RED CELERY.—This fine Celery has given such entire satisfaction, not only for the great size to which it attains, but for its unequalled crispness and exquisite nut-like flavour, that it needs no further recommendation. Seed may be had genuine from the grower, WILLIAM COLE, Dartford, Kent, in sealed packets, 1*s.* 6*d.* each, or the amount in postage stamps; also of Messrs. J. and J. FRAZER, Leyton, Essex; Mr. BUNYARD, Maidstone, Kent; Mr. CRIPPS, Tunbridge Wells, Kent; Mr. DENYER, 32, Grace-church-street, London; Mr. TILEY, 16, Pulteney-bridge, Bath; Mr. FRANCIS, Hertford; Mr. MILNER, Bradford, Yorkshire.

A liberal allowance to the trade.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

CUCUMBERS.

THE THREE BEST CUCUMBERS EVER YET SENT OUT.

EDWARD TILEY begs to remind the public generally, that he has now ready to dispose of good sound seed of his VICTORY OF BATH, GORDON'S WHITE SPINE, and LORD KEYNON'S FAVOURITE (this last is the best for winter cultivation). These CUCUMBERS have been thoroughly proved to the satisfaction of hundreds of growers, and need no comment on their superiority. Victory of Bath, 2*s.* per packet; Gordon's White Spine, 1*s.* 6*d.* do.; Lord Keynon's Favourite, or Winter Cucumber, 2*s.* 6*d.* do., or one packet of each of the above Cucumbers, 5*s.*

E. T. begs to mention that he has the whole stock of the seed of that unequalled Melon, "Brougham Hall," Green-flesh; it has surpassed all others this season at the London exhibitions. It is as much superior in flavour to all other Melons as the Green-gage is to all other Plums. Sold in packets of 7 seeds, 2*s.* 6*d.* each.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance (either in cash or in postage stamps) must accompany the order.

DAHLIAS.

CHARLES TURNER has much pleasure in offering the following beautiful new DAHLIAS, plants of which will be ready in May next.

QUEEN OF THE ISLES (Skynner).—White, distinctly tipped with deep crimson, very striking and beautiful; the petals being smooth and well arranged. It was exhibited at Cambridge and Norwich, 12 blooms on each occasion, and received the highest award and commendation. Warranted the finest Dahlia ever offered by C. TURNER. 3 to 4 feet—10*s.* 6*d.*

MRS. SELDON (Turner).—Bright pure yellow, good petal, flower very circular and full size, extra fine. It was awarded a first-class Certificate at Birmingham for six blooms; the only place exhibited at, the stock being short. 5 feet—10*s.* 6*d.*

THAMES BANK HERO (Robinson).—Deep crimson, full size and constant, good form. 4 feet—10*s.* 6*d.*

SERAPH (Fellows.)—Bright novel orange, compact, fine form, a very constant flower for exhibition. Received first class Certificate at Norwich. 3 feet—10*s.* 6*d.*

DUKE OF CAMBRIDGE (Fellows).—Silvery lilac, very constant, and good habit. 3 feet—7*s.* 6*d.*

QUEEN OF LILACS (Turner).—Pale lilac, full size, fine form, and noble show flower. 4 feet—7*s.* 6*d.*

UNIQUE (Turner).—Fancy, dull red with white tip, a fine form. 2 to 3 feet—7*s.* 6*d.*

MRS. LABOUCHERE (Turner).—Fancy, scarlet, white tip, a sweet variety; being very bright, constant, and not more than 18 inches high. 7*s.* 6*d.*

PURITY (Turner).—The finest white raised, when caught very beautiful, but being uncertain will not be charged for. Purchasers of the others may have plants gratis.

A Descriptive Catalogue ready in January, comprising all the novelties.—Royal Nursery, Slough.

SUTTON'S EARLY CHAMPION, 2 to 3 feet, the forwardest PEA known, and SUTTON'S EARLY GOLIAH, 3 to 4 feet, the best for second crop. Price of either sort, 10*d.* per quart, 3*s.* per gallon, or 21*s.* per bushel. The above Peas took nearly every prize at the Newbury, Henley, and other horticultural shows, where they were exhibited last season.

JOHN SUTTON and SONS confidently recommend the above Peas.—Reading Seed Warehouse, Reading, Berks.

CHEAP DAHLIAS, FUCHSIAS, AND VERBENAS, FOR 1850, warranted true to name.

J. COURCHA can supply most of the new Dahlias of last year at 7*s.* per dozen; older varieties at 3*s.* per dozen.—A Catalogue may be had on application to JOSEPH COURCHA, Florist, 8½, Wellington-row, Hart's-lane, Bethnal-green-road, London.

RANUNCULUSES, ANEMONES, GERANIUMS, LILIUM LANCIFOLIUM, AND AURICULAS.

Seed and Horticultural Establishment, Sudbury, Suffolk.

HEATING BY HOT WATER.

J. WEEKS AND CO., King's-road, Chelsea, Patentees and Manufacturers of HOT-WATER APPARATUS, warrant their Boilers to be the most efficient and economical of any yet invented, at prices from 3*l.* to 15*l.*; the fire warranted to last 15 hours without attention. To be seen in extensive operation at their Show Establishment, King's-road, Chelsea; and also at most of the Nobility and Gentlemen's Seats in the country, the London Nurseries, &c.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

ALSO THE CULTIVATION OF THE CHOICEST PLANTS, VINES, FERNS, &c.

J. WEEKS AND CO., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works now in progress, which will attest as to quality of materials and workmanship. They have now erected on their Premises, for inspection, a great variety of Hothouses, Greenhouses, Conservatories, Forcing-pits, &c., all heated by HOT WATER in various forms, showing the most improved methods of Building, Heating, and Ventilating all Horticultural Erections. By means of these houses, they are enabled to grow Stove, Greenhouse, Ferns, and other Plants, in such immense numbers, that they are sold at LESS THAN HALF-PRICE. Mats, Mushroom Spawn, and everything connected with the Nursery and Seed departments; Plans, Estimates, and Catalogues forwarded on application.

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

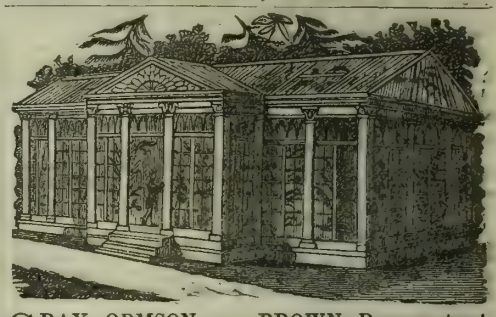
GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass-Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.



See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Hothouse Works, Stamford-hill, Middlesex.

GRAY, ORMSON, AND BROWN, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any enquiries. They beg also to say the building only is referred to, as the Heating Apparatus was not erected by them.

GRAY, ORMSON, and BROWN, have also the honour of referring to many of the nobility and gentry in the country, and to several of the London Nurseries.

N.B. Plans and Estimates furnished free.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

NEW DARK FUCHSIA, "SIR JOHN FALSTAFF."

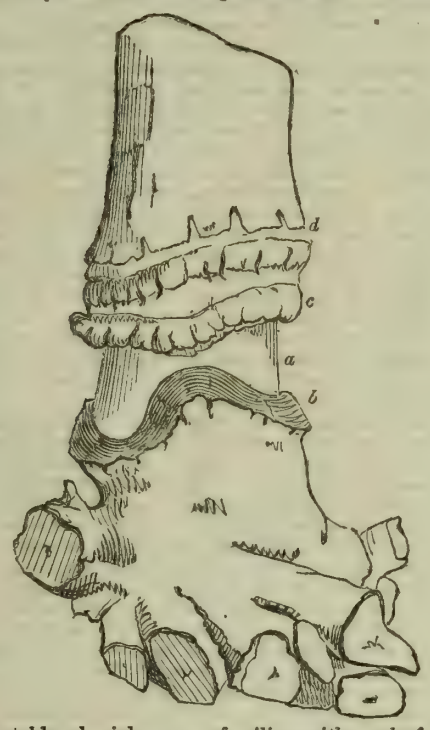
C. TURNER intends sending out this approved noble variety in spring. For price, &c., see Catalogue, which will be ready in January.—Royal Nursery, Slough.

The Gardeners' Chronicle.

SATURDAY, JANUARY 5, 1850.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	Jan. 7	Entomological	8 P.M.
		Pathological	8 P.M.
		Medical	8 P.M.
		British Architects	8 P.M.
TUESDAY,	— 8	Syro Egyptian	7½P.M.
		Civil Engineers	8 P.M.
		Medical and Chirurgical	8½P.M.
		Zoological	9 P.M.
WEDNESDAY,	— 9	Literary Fund	3 P.M.
		London Institution	7 P.M.
		Graphic	8 P.M.
		Ethnological	8 P.M.
		Geological	8½P.M.
		Pharmaceutical	9 P.M.



In our last volume (p. 708) we drew attention to the state of some CAMELLIA PLANTS which had died in a mysterious way, in the garden of one of our correspondents. It will be remembered that the stems of these plants were deprived of a ring of their bark just below the ground level, and when taken up were found to present the appearance shown in the annexed cut. For the cause of this we referred to the gardener who had had the charge of the plants. We entertained no doubt that the ringing had been done intentionally. Mr. DUNCAN, however, the very experienced and intelligent gardener at Basing Park, in a subsequent Number questioned the justice of this view, and suggested that the injury might have been owing to low temperature. As this is a case of some importance in itself, as well as with reference to Mr. DUNCAN's suggestion, we make no excuse for referring to it once more.

The wound on the specimen sent us was about half an inch wide in one place, and not much more than one-eighth in another: the lips approaching each other at one point of the circumference. But it had originally been from ½ to ¾ inch wide, the difference in the original and present dimensions being owing to after-growth. The upper lip had grown downwards from *d* to *c*, and the lower had slightly advanced, as is shown at *b*. We conceive this to be irreconcileable with injury from frost; the two lips of the wound were originally *even*, and approached each other exactly in the manner which is commonly observed when a ring of bark is removed awkwardly by a pruning knife. Had frost been the cause, the lips of the wound would have been at very irregular distances from each other, and rugged instead of even. This we look upon as conclusive as to the manner in which the wound was not produced. It was no doubt caused by some cutting instrument. It may be said that a rat or some such animal might have gnawed the stems all around; but that also is, we think, an inadmissible explanation of the appearance in question. Because, had gnawing been the cause, there must have been traces of teeth upon the wood; but, on the contrary, the surface *a* was perfectly smooth. Moreover, it (*a*) had unmistakeable marks of the edge of a knife; so that no doubt can remain of the origin of the wound. The stems had been ringed.

It is possible that this ringing may have been practised in the fair exercise of a gardener's art, for the purpose of throwing the Camellias into flower. We need not say that this is a common operation; it being found that, if the elaborated sap is not allowed to disperse itself downwards, it will collect in all the parts above the wound, and expend itself in the formation of flower buds. But although we must concede this, we think it necessary to add that if such was the gardener's intention he exhibited a lamentable want of knowledge of his business. He ought to have been aware of several things here overlooked. In the first place he should have known that in the operation of ringing it is indispensibly necessary that the wound should be so narrow that the two lips may reunite in the course of a few months, so as to re-establish the natural communications. Here, on the contrary, the wound was so wide that although the upper lip had actually advanced downwards nearly half an inch in one place, yet the communication had not been nearly re-established.

In the next place the wound should not, on any account, have been inflicted on the main stem. The operation is apt to cause the eventual death of the limb, be the skill employed what it may. To commit then so serious a mutilation of the trunk, at the very ground level, was to do the most dangerous thing that perverse ingenuity could have suggested; it caused the death of the whole tree—as was to have been expected. Finally, if for any reason it was necessary to perform the operation in the dangerous place and manner in question, this, at least should have been attended to—to close the wound with grafting clay, or some such substance, and to cover the whole with damp Moss, in order to promote the rapid formation of the granulations which appear under such circumstances, and which replace the part removed. Nothing of the kind seems to have been thought of by the gardener, and the consequence has been the destruction of his master's Camellias.

The subject being now before us, we may as well advert to another point, which this woodcut illustrates. It is an axiom among Vegetable Physiologists that sap rises in a crude state through the stem of a plant, thence is propelled into the leaves, where it undergoes certain changes, after which it returns to the stem in its altered condition and is dispersed downwards over the system, very much through the agency of the bark. This sap is commonly called the descending sap. One of the proofs of this being true is the well-known fact that if a ring of bark is removed, the upper lip is soon covered with drops of elaborated fluid, while the lower lip remains comparatively dry; and that new growth also takes place at the upper lip where the elaborated sap (or organisable matter) collects, in a much greater degree than on the lower lip. The case now under consideration entirely confirms this opinion; it will be seen by the figure that a great growth had taken place from *d* to *c*; but that at *b* the wound was in much the same state as it was left in by the knife. All persons who have studied

vegetable physiology are familiar with such facts. Nevertheless we find that Professor SCHLEIDEN, in the following passage of the book we lately reviewed, flatly contradicts the statement:

"Yet the stock must always exert a greater or less influence on the eye or graft, as the sap brought to it must pass through the cells of the stock, and become changed there. In this case the relations are too complicated to enable us to offer an explanation. All that is known on the subject is detailed in manuals of horticulture. I will mention one case. If a branch of a quick-growing plant is grafted upon a very slow-growing one, as, for instance, the branch of a Plum upon a Sloe-stock, the graft will grow rapidly, but not so the stock, which retains its slow-growing character*, —a striking example of the permanency of the specific life of the stock, and, as it appears to me, affording a fatal argument *against the pretended descent of the sap. If a descending bark sap existed,* the Sloe-stock would be naturally covered with annual rings of Plum-wood from the graft, and it would grow in proportion to the growth of the graft; but this is by no means the case, for the new annual rings are formed, not out of a descending bark-sap, but out of a cell development of the cambium already existing in the stock, and having essentially the same characters. The formation of new wood of the nature of the graft has always been taken for granted, in order to prove the descent of the bark-sap; but we find that this wood does not partake of the nature of the graft, and that it must therefore be formed independently of any descending juices." P. 535.

For the moment we want space to reply to this speculation, which after all is only an old one in a new dress; and we the more willingly defer our own remarks, in the hope that some of our talented correspondents will say how far they agree with Professor SCHLEIDEN in his belief that descending sap has no existence!

THE cause of the PUBLIC *versus* the GLASS DEALERS has found an advocate for the defence in the person of a Mr. BARWELL JONES, who, in a letter from Kidderminster (?) complains of what he calls libellous imputations upon the character of respectable tradesmen who "are not to be gibbeted because they honestly state before an arbitrator that they do what is known to be the universal practice of the trade." Upon this particular point we will admit that we spoke more strongly than we should have done had we been aware of some circumstances that have since come to our knowledge. Since our article of Dec. 8 was published, we have referred to various old tariffs and Acts of Parliament, from which we find that the term rough plate was applied to unfinished blown plate glass before the time that cast plate was made in this country, and that the term has continued to be employed among dealers in glass, in the same sense, until this day. We are, therefore, bound in fairness to recall any expression that the fastidious reader may suppose implied a deliberate want of honourable intention in the use of that term on the part of Mr. CHATER and others. We acquit them of having done any thing contrary to the usage of the trade.

But while we freely admit thus much, we do not the less emphatically condemn the system to which custom has given a sort of sanction, the *effect* of which is undoubtedly to impose upon the public, whatever the intention of the vendor may be. That vicious code of morality, which unfortunately runs through so many trades and professions, we trust we shall always continue to feel it our public duty to expose whenever it interferes with the interests of those who look to our columns for protection.

Disclaiming, then, all intention of applying our remarks in a personal sense we proceed to notice the very small kernel which Mr. BARWELL JONES has enclosed within a rather bulky husk.

We say that it is as great a wrong to the public now to sell sheet glass under the name of rough plate, as to sell Cape wine under the name of Madeira, or base hardware washed with silver under the name of plated goods. Our correspondent justifies the glass dealers in the course they have taken, upon two grounds. The first is, that as blown glass was invented before cast glass, therefore plate glass must have been in the first instance blown, and consequently the dealer is clearly authorised to call blown glass plate glass. So far as the custom of the trade is concerned, we have already conceded this point. But the public question is *not* what plate glass once was, but what it now is. It is a bad apology for selling goods under names that the buyer no longer knows them by, to say that some time or other, within legal memory, such names were borne by them. A man might as well justify himself in calling his neighbour a villain, upon the plea that in former times the word was inoffensive, and merely expressed a particular social position. Goods sold in 1849 ought to bear the names by which they are known to the public in 1849, and not what they bore in 1780. In trade mysteries buyers cannot be expected to be proficients, and we suppose that sellers are not over anxious that they should become so.

Mr BARWELL JONES's second and great point is, that because blown glass is known in the trade as plate glass, and sold as such, dealers are therefore justified in selling rough sheet as rough plate. It is of this very practice that we complain. And we maintain that the public is unfairly treated by not being informed of a custom which continues to exist, although great manufacturers profess their ignorance of it. Let us ask the glass trade whether they state the fact in their "tariffs," as their price-lists are called; and, as the lawyers say, *if not, why not?* We have now before us four such lists (for 1849) from four great houses, which we shall designate as A, B, C, and D. In A we have the following kinds of glass offered for sale: crown, double crown, *patent* plate, sheet, and rough plate, with some minor qualities which need not be quoted. In B, we have polished plate, rough plate, horticultural plate cast, &c. In C, the kinds are crown, patent plate, sheet, rough plate, polished plate, &c. In D are offered horticultural sheet, HARTLEY's patent rough plate, crown, sheet, and rough plate. Now, in all these cases, and we believe in every other case, a clear distinction is made between crown or sheet (that is blown) glass, plate (or cast), and patent plate (we believe blown); and plain people, reading such lists, can come to no other conclusion than that, in buying plate, they do not buy blown glass, except in the case of one kind, which is very properly and distinctly indicated by the prefix "patent." Therefore, as ordinary plate glass is cast, so must rough plate be in the minds of people unlearned in glaziers' mysteries. If two sorts of plate glass are distinguished, the rough and the smooth, why not also distinguish two sorts of sheet glass, since there are two, the rough and the smooth. Why sell rough sheet for rough plate, they having no resemblance to each other? It is contended that there is no motive for doing so no advantage resulting from it to the seller; we are not, however, credulous enough to believe that the substitution takes place without some very sufficient

* Lindley: A Theory of Horticulture, p. 237.

motive, into which we hope we may not be obliged to inquire. We, however, impute no motives: we dare say that all is fair and usual; but we also say that such lists have the effect of misleading buyers to the most serious extent, as was proved by the incident that has led to this discussion. If glaziers wish to sell rough sheet glass, by all means let them, provided they call it by its right name. We hope and believe that they will see the propriety of being hereafter more explicit; for they cannot but feel that the existing practice leads to consequences which honest men must deeply regret, although trade interests may for the moment cause them to attempt a justification.

As to Mr. BARWELL JONES, and his charging malicious intention upon those who venture to put the public on their guard against the tricks, or if he pleases, the customs, of tradesmen, it is preposterous. According to Chief Justice FITZ JAMES, "if a man speak against the KING'S supremacy, by any manner of means, that speaking is to be understood and taken in law as malicious." We have only to substitute the "craft of glass dealers" for "the KING'S supremacy," and we have this Mr. BARWELL JONES repeating the notorious old Judge's outrageous dictum. People must be very sore when so small a thing makes them frantic.

Our correspondent is possibly some very young man, fresh from school, with his head full of romances, and eager to push his hand into the fire like another SCÆVOLA. As he grows older, he will, it is to be hoped, learn wisdom enough to avoid arguments in which it would be no credit to him to be successful. In the meanwhile, without waiting till he shall arrive at years of discretion, we may congratulate the public upon the "mistake" in glazing Winchester gaol; for it will have effectually prevented the recurrence of similar mistakes in glazing conservatories, unless those who have such work to execute should be of opinion that glass is glass, and one kind as good as another. If Mr. JONES is some elderly gentleman, we can then assure him that we have no fault to find with him which does not lie against him as one of a class. We dare say he is a highly respectable man: but, like other men, he naturally enough does that which his predecessors have done for years, which our predecessors have submitted to, and to which, if some effectual stand be not made, our successors must continue to submit, as long as glaziers have interests different from those of their customers.

ON THE DEGENERATION AND IMPROVEMENT OF VINE STOOLS.

By M. BOUCHARDAT.

THE Vine is the best plant that can be taken for the purposes of studying the modifications which a divided individual undergoes in consequence, either of the different influences to which it is subjected, or of the various conditions in which it is placed. Indeed, of all the plants which are multiplied by division, the Vine is the most common, the most rich in varieties, and the most frequently made the subject of experiments, varying in different countries and for different varieties.

The numerous observations collected by the author in the work from which this extract is made, are arranged in three chapters. In the first the degeneration of Vine stools abandoned without culture is considered; in the second that of neglected Vines; and in the third, the degeneration, and improvement which carefully cultivated Vines can experience, are examined.

In the first chapter the following facts are stated by the author, as the results of his examination: 1st, the limit of the degeneration of Vine stools abandoned without culture is different for each particular variety; 2d, the first effect of abandonment is to change the taste of the bunches, the period of their ripening, and their size; 3d, the next is to diminish the size of the Grapes composing the bunches; 4th, the third is to lower the amount of useful produce. When Vines thus changed are again cultivated, the first modifications are soon effaced, but the third is so lasting that the author has divided it into several sub-varieties. The loss in quantity is often very visible even after 25 years of good cultivation, and the Vine has been at several times completely invigorated. 5th, the more productive the stock, the more it suffers by being abandoned; it either perishes altogether, or the amount of its produce is less than that of a much worse stock.

In the second chapter the author has proved that the *pineaux fromentés*, which form perfectly distinct sub-varieties, multiplying by the division of individuals, spring from the *francs pineaux* which correspond to them, and that these remarkable modifications of the type can be produced spontaneously in Vines, the cultivation of which has been a long time neglected.

In the third, and by far the most important chapter in the book, the author has opposed facts to the extreme opinions of those who maintain, on the one hand, that the varieties of Vines remain constant, and that they do not produce by division new varieties; and on the other, that Vine stools transplanted from one country to another lose their own peculiar characters, and take those of the country in which they are newly planted.

In the first division of the present chapter those modifications which depend on the principal exterior agents or conditions of culture, and not on the individual plant, such as the influence of soil, manure, exposure, and transplantation to a distance, are examined.

In the second division the accidental conditions depending on the individual are studied; it is here that the author has discovered the most interesting and important causes of the modifications which Vine stools undergo. It is proved by observation that varieties perfectly new and stable can be obtained, all belonging, however, to the group from which they spring, and resembling, by very marked characters, the individuals which gave them birth. As the differences can be traced to the quality as well as the quantity of produce, their study is very interesting. It is found that on a stool can be produced suckers, buds, and internodes, having peculiar properties which may be perpetuated by the division of the new individual so as to give birth to a distinct variety. The author describes a modification which gave rise to buds producing fruit differing in colour from that usually gathered from the stock. White *tressots* produced suckers which gave Grapes variegated with black and white. This acquired variety can be multiplied by the division of the branches which have acquired new tendencies.

The author has investigated some remarkable modifications in stocks whose young wood was dead, and which gave shoots only from old stocks. He there discovered the origin of those small-berried, unproductive varieties, described by him under the names of *pineau demoisellat noir*, *pineau demoisellat blanc*, &c.

In the last section, the accidental modifications of Vine stocks, giving rise to varieties more and less productive than the original types, are studied. In this rapid sketch of M. Bouchardat's memoir, one example only can be given. A stock of the variety of Vine called the *bon tresseau*, consisting of four limbs fit to produce four new stools was planted. Three of the new stools were very productive, and in every respect similar to that from which they sprung; the fourth had vigorous wood, but every year produced a very small quantity of Grapes. This last was planted and multiplied; the causes of its degeneration are attempted to be explained, and the author then proceeds to show how, in the absence of fruit, good varieties can be distinguished from the bad. He shows in what way a knowledge of these matters can be applied in the establishment of a good Vine, and how to judge accurately of the value of the seedlings.

Plants chosen for the purposes of breeding often present considerable difficulties in their propagation; two methods are given by which these obstacles can be overcome. They consist in the judicious application of manures properly chosen, and in a method of plantation by which cuttings deprived of old wood may be used.

From the facts contained in the present memoir it is clear that the surest and quickest way of bringing our Vines to perfection is to observe with the greatest possible care those varieties which have been tested by long cultivation; to be always watchful, in order not to let slip, without making use of them, those individual modifications which appear from time to time on some branches of our stocks, and which, if properly propagated, would give rise to sub-varieties remarkable either for their fecundity, early ripening, the little care requisite in their cultivation, their power of resisting cold and moisture, longer duration, better produce, or, in short, for some essential quality.

If this doctrine, which is developed in the present memoir, and supported by well observed facts, attracts the attention of Vine growers, the author may hope to open to them a field rich in the elements of progress. *Comptes Rendus.*

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

(*Continued from p.* 821.)

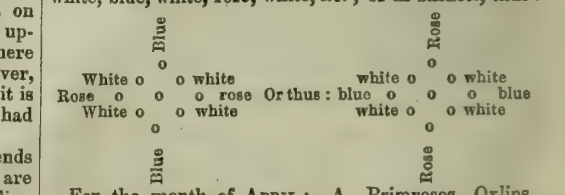
IT has been stated that the country around Elvaston consists altogether of table land, and that it is totally destitute of diversity of surface. It is not, however, devoid of fine views, for on landing on the east wing of the castle, there is presented to the eye one of the most extensive prospects which almost any country can command, and one certainly magnificent of its kind. It is termed, and with much propriety, "the great east-wing avenue." The approach to this avenue is from the terrace, which surrounds the castle by a flight of steps 24 feet wide; each step is 2 feet in the tread, and only rises 3½ inches, which is the height of all the steps in the several terraces, rendering their ascent or descent easy—a point in the formation of terraces which should not be disregarded. It is precisely half a mile from the steps to the termination of the dress ground, all being perfectly level, with a finely kept lawn 150 feet broad, extending the whole length unobstructed by any plant or other object. Beyond the dress ground, every tree, for the distance of five miles, has been removed which obstructed the view, extending 10 miles into Nottinghamshire. An avenue of this extent leading from the castle is terminated only by the hills in the distance. On the terrace, right and left of the castle, are Yew hedges of great height; and descending the steps on each side are two very fine specimens of Gold Yew, upwards of 13 feet high. One of them was brought here from Surrey about 2 years ago; it does not, however, exhibit any evidence of having been removed, for it is growing in equal luxuriance with its fellow, which had been previously established there.

As we have already stated, the dress ground extends half a mile. Both sides of the avenue alluded to are planted precisely alike, and with plants of corresponding height. On each side are arranged circular beds, leaving in the centre 150 feet of turf quite clear. These beds are edged with common Yew, trimmed about 2 feet high; the centre of each bed is planted with Hollyhocks, and around the edges next the Yew are dwarf Dahlias. Thus they represent immense green baskets full of flowers, and, on account of their extent, the effect during autumn is exceedingly grand. The first line of plants behind these takes a wavy direction agreeably with the circles, and is composed exclusively of Irish Yews from 8 to 10 feet high. The first straight line of plants in the rear of them consists of Araucaria imbricata, alternated with Picea nobilis and Cryptomeria japonica; consequently there is twice the number of Araucarias as of each of the others. The second row is planted with Cedars of Lebanon and Deodars alternately. The third line with Pinus insignis, Douglas Firs, Picea Webbiana, Abies Pinsapo, and Hemlock Spruce. These latter alternating with the Pinus insignis, which constitutes the principal feature of this line, being all large plants. Both sides are, as above, planted for the extent of half a mile, the plants being all selected specimens. The effect of the whole is magnificent, and constitutes one of the grandest features of Elvaston.

The north terrace garden is screened partly by a Yew hedge 12 feet high. This garden leads to the lake, and is approached from the castle by broad semicircular steps, with Box hedges on each side, 3 feet high and 2 feet wide, cut square. Descending on each side with the steps are rows of Irish Juniper, from 8 to 10 feet high. This garden is in scroll pattern, profusely ornamented with vases and flower-stands, bounded on the other sides by Holly hedges 12 feet high; a number of fine specimens of Irish Juniper are disposed at the termination of each scroll, in order to give character to this peculiar style. We observed here a fine plant of the rare gold-striped Irish Yew 5 feet high, and also a noble Juniperus excelsa 15 feet in height, a perfect pillar.

On the west side of this garden is an entrance which leads to the garden of the "Three Sisters," so named from having been laid out under the direction of his lordship's three sisters. It is an old garden, in the geometric style, and is chiefly planted with sweet-scented plants, such as Honeysuckles, Roses, &c., arranged in masses; these afford a supply of cut flowers. There are also here some grand specimens 15 feet high, of Cupressus torulosa. Proceeding westward from the garden of the Three Sisters we enter a labyrinth, also designed by these ladies. It is formed of Portugal Laurel hedges, 11 feet high, trimmed square, a kind of hedge very suitable for a labyrinth.

Leaving the labyrinth and the garden of the Three Sisters, and proceeding northwards, we enter the Magnolia Garden, which is divided into beds, having Sweetbriar hedges. The Magnolias employed are all deciduous species or varieties, and every sort which could be obtained is to be found here. From the circumstance of deciduous kinds only being employed, an important object is kept in view, viz., the rendering this a spot of attraction in spring, the whole of the beds being carpeted with Lily of the Valley. They are, therefore, most beautiful just as the Magnolias begin to develope their leaves and flowers. *R. G.*



(*To be continued.*)

M. CHEVREUL'S ARRANGEMENTS OF FLOWERS.

THE following arrangements of flowers are given by M. Chevreul, for the purpose of illustrating the principles before laid down, and of serving as a guide to those who wish to carry them into practice. Our readers must, however, in referring to these examples, bear in mind that the combinations of flowers given below are recommended for gardens in the neighbourhood of Paris, and that, because of the difference of our climate and the consequent different periods of flowering, the identical plants chosen by M. Chevreul will have, in some cases, to be replaced by others of the same colour and appearance, in order that all the individuals composing any one group may be in flower at the same time.

For the month of FEBRUARY:—If the winter has not been very severe or long, three varieties of Crocus make their appearance in this month, viz., the white, violet, and yellow. A border of a single line may be made with these placed in any one of the five following orders, viz.: 1, yellow, violet, yellow, violet, &c.; 2, yellow, violet, white, yellow, violet, white, &c.; 3, yellow, white, violet, white, yellow, white, violet, &c.; 4, yellow, violet, yellow, white, yellow, violet, yellow, white, &c.; and 5, violet, yellow, violet, white, violet, yellow, violet, white, &c. They may also be arranged in quincunx either in a border or a basket.

For the month of MARCH:—Winter Aconite may be opposed to Snowdrop, or vernal Spring-flake (Leucoïum vernum). In some seasons the Christmas Rose (black Hellebore) remains in flower in this month, and may be surrounded with winter Aconite, Violets, and Snowdrops in no particular order. White, rose, and blue Hepaticas may be arranged in a border, thus: white, blue, white, rose, white, &c.; or in baskets, thus:

For the month of APRIL:—A. Primroses, Oxlips,

&c.—Primroses being of several distinct colours, offer considerable facilities in their arrangement. A border of Primroses in the following order looks well: red, white, orange, lilac, yellow, brownish violet, white, red, white, orange, &c., repeating the series in the same order. If a circular or elliptical border be required, one composed of Primroses arranged as follows will be found agreeable to the eye: white, red, white, orange, or orange edged with brown, violet or lilac, yellow, Oxlips or Cowslips, violet or bluish lilac, orange or orange edged with brown, white, red, white, and so on as before. The yellow Oxlips or Cowslips occurring at equal distances produce an excellent effect, their straight peduncles, covered with yellow flowers, agreeably destroying the flat appearance which would otherwise arise from the uniformity in the height of the other plants.

If from the last arrangement the orange flowers be taken away, the effect is greatly deteriorated by the loss of symmetry. This observation must be borne in mind whenever a border forming a closed circle is, from its small size, at once taken in by the eye; if this be not the case, the first arrangement may be preferred to the last.

B. The large-flowered Arabis, Saxifraga crassifolia, the Arabis, Caucasian Doronicum; then repeat in the same order. If the Arabis are left to themselves they spread too much relatively to the Saxifrages, and there is then too much white. If it is too much trouble to keep the Arabis in bounds, the following arrangement will be found useful: Arabis, Saxifrage, Doronicum, Arabis, Saxifrage, Doronicum, &c.

C. Doronicum, purple Honesty; or, Saxifrage, Doronicum, Arabis, purple Honesty; or, Saxifrage, Arabis; then begin again, observing the same order. To insure this border looking well, care must be taken that the flowers of the Arabis and Doronicum do not spread too much relatively to the Saxifrages or the Honestys. Again, in the last arrangement, one Honesty may alternate successively with one Saxifrage, so as to have the Honestys between two Doronicums and the Saxifrage between two Arabises.

D. 1, Blue Hyacinth, yellow Narcissus, blue Hyacinth, yellow Narcissus, &c.; 2, Hyacinths alone, in the following order: White, red, white, red, &c.; or thus: white, blue, white, red, white, blue, white, red, &c. Large baskets of blue Hyacinths alternate well with Doronicums; so do large baskets of white Hyacinths with Saxifrages.

E. 1, Evergreen Candytuft (Iberis sempervirens), Rock Alyssum (Alyssum saxatile), Candytuft, Alyssum, &c. 2, Candytuft, Virginian Lungwort (Pulmonaria virginica), Alyssum, then repeat. 3, Candytuft, Phlox verna (purple) or Anemone pavonina (red), or Anemone apennina (sky-blue); Alyssum, Phlox verna or Anemone pavonica, or A. apennina, then begin again and repeat in the same order.

F. Beds of Periwinkle (Vinca minor and major), white and blue mingled with white and violet Violets, and with Anemone nemorosa, or Isopyrum thalictroides; and, if the beds are of any size, with yellow flowers, such as Cowslips, Ranunculus Ficaria, &c., produce a good effect.

G. 1, Dwarf Peach trees with double red flowers (Amygdalus persica) Kerria japonica, dwarf Peaches, Kerria japonica, &c. 2, Dwarf Peaches, yellow Jasmine (Jasminum fruticans), dwarf Peaches, yellow Jasmines, &c.

H. Tartarian Honeysuckles (Lonicera tatarica), red, the white-flowered variety of the same plant, then the red again, then the white, and so on. This is, however, rather heavy; a Kerria japonica may be interposed between two Honeysuckles, red or white, but in consequence of the great difference in their form they must not be so near as to touch each other; there must be, moreover, behind such a line as this other good-looking plants.

I. A Pyrus japonica rising in the form of a bush above a bed of Violets produces a good effect, by the contrast of its scarlet flowers with the colour of the Violets.

DISEASES OF PLANTS.

(*Continued from page* 819.)

Third species. Rameal Necrosis.—The subtraction of caloric produces effects analogous to those of its excess. Thus we see the branches of trees, on the coming on of sudden frosts, or in the heart of winter, turn black, shrivel up and present the appearance of having been burnt by fire. Those branches which from the shortness of the autumn or the want of the usual heats have not been able to ripen properly, show this phenomenon frequently, especially in the case of ill nourished and delicate plants. In the spring the stems of Tulips and other flowers perish from the same cause.

It appears to me that it is to this head that should be referred that disease of the Olive called *Brusca*, upon which we have two excellent memoirs, between which I should certainly give the first place to that of *Cosimo Moschettini*. The constant alternations of heat and cold, when bright hot days are followed by cold clear nights, seem to occasion it. The leaves turn brown, dry up and fall, leaving the bare tree with all the appearance of being burnt. As it is observed that it is always the weakest trees that are most liable to the *Brusca*, I conclude that the best method of preserving them from it is good cultivation, judicious treatment, and more especially reserve and economy in pruning, a thing so little attended to, or I may say almost entirely neglected.

Fourth species. Necrosis of Buds.—If a spring, following a mild winter, is interrupted by hoar frosts or frosts, it becomes very injurious to trees. The young buds, at the moment when they are ready to burst, are suddenly deprived not only of the heat necessary for their development, but also of a portion of that which is essential to their vegetable life; and whilst the rest of the branch does not suffer, they are in various degrees affected. Thus I have sometimes observed all the flower-buds killed, whilst the leaf-buds have not suffered. So also in the case of buds which include leaves and flowers, the latter will sometimes be found to have been killed, whilst the leaves are uninjured.

Fifth species. Pistillary Necrosis.—The winter of 1805 was very mild, and moist beyond measure. Vegetation was far advanced in the beginning of March, and several trees were already in full flower. At the end of that month a cold wind, followed by some hoar frosts, stopped their progress. I hastened to examine with care the flowers of various plants, which were either fully out or ready to burst. It was my fortune to observe a phenomenon which I had not happened to read of in any writer. Examining the flowers of the Cherry, the Apricot, and the Pear, I observed the male organs generally perfectly sound. Those attacked were flaccid, but preserved their parts to all appearance well organised, and the re-appearance of the sun restored their vigour. But it was very different with the pistils. They were all burnt up, as it were, which was very evident the moment the sun shone upon them. The Pears were in a worse condition than the Apricots. This astonished many persons, as it did me at first; for it seemed that the Pear, a natural production of our own country, suffered more than the Apricot, imported from the hot climate of Asia. Upon carefully investigating the matter, I observed that in the Pear the pistil is much less protected than in the Peach and Apricot, in which the petals form a good screen round the ovary, to which the external air has much less ready access. The Pear does not enjoy this advantage. This necrosis was not confined to the style or stigma, but the whole ovary was affected. I examined some unopened buds of the Pear, and I found them injured in a similar manner, which was not the case with the Peach and Apricot. Looking at the trees themselves, I found that it was the oldest among them that had suffered the most. Finally, after several days, during which I did not lose sight of these flowers, I saw the male organs remain the usual time in their healthy state, whilst there was scarcely a vestige left of the female organ, which had fallen off in the form of a blackish powder. I must not omit to state that during several successive years, the observation of the flowers of herbaceous plants which have suffered from hoar frosts has shown me that the female organs are much more injured than the male.

Those who love to persist in the strictest analogy between the animal and vegetable systems, will find in this observation a fresh argument in support of their theory, as it is the general opinion that sterility in animals proceeds more frequently from the female than from the male. To me it suffices to observe that the above-mentioned circumstance may be due in part to that which Linnæus has observed, namely, that the extremity of the pistil is deprived of epiderm.

NOTES ON SOME NEW VARIETIES OF PEARS.

From the "Bulletin de la Société d'Horticulture Pratique du Rhone; pour 1849."

This contains descriptions of many old and new sorts presented for exhibition; and as these descriptions appear to have been carefully made, by M. C. Fortuné Willermoz, the following extracts will probably be acceptable to those interested in the cultivation of Pears.

Ananas.—Middle-sized, short-pyriform, surface somewhat uneven; stalk thick, about half an inch in length, oblique; skin smooth, soft, of a golden yellow with reddish dots; flesh pale yellow, very fine, melting, full of sugary juice, perfumed. Season, end of September and beginning of October. This was also exhibited under the name of Bergamotte Cadette.

Angora. "Syn. Belle Angevine, Faux Bolivar, Royal d'Angleterre, Comtesse ou Beauté de Tervueren, Grosse de Bruxelles, Duchesse de Berri d'Hiver, Très Grosse de Bruxelles et Lyons."—[The description appears to apply to the Uvedale's St. Germain. The Angora Pear, said to have been brought from the Levant by Tournefort, has proved to be the Catillac.]

Belle Epine Dumas. Syn. Epine de Rochoir, Beurré Rochoir, erroneously, at Lyons. This must not be confounded with the Epine Dumas, of which the Duc de Bordeaux is a syn.—Fruit very large, pyriform, somewhat turbinate; skin smooth and fine, golden yellow on the one side, and of a vermilion colour on the other, dotted with reddish brown, russeted about the footstalk; the latter is about an inch in length, bent, implanted in a small irregular cavity; eye small, in a shallow evenly-formed cavity; flesh pale citron, very fine, buttery, containing a very agreeable sugared juice. Season, commencement of October. The tree requires a rich substantial soil.

Bergamotte Edouard Sageret. Syn. Poire Sageret No. 2, Poire Edouard.—Fruit middle-size, pyriform; flesh coarse, rather gritty round the core, tender but not melting, sweet and perfumed. Season, end of August.

Bergamotte Lucrative (not Beurré Lucratif). Syn. Bergamotte Fièvé.—Fruit very large, roundish, flattened. Classed among those of first-rate quality. Ripe in September.

Bergamotte Sageret. Syn. Poire Sageret, No. 1.—Fruit middle-sized, roundish. Flesh white, very fine, melting, sugary. Ripens in November and December, and when grown on a standard will keep even till February or March.

Beurré Goubault. (This must not be confounded with Doyenné Goubault.)—Fruit middle-sized, almost round; skin pale green, passing to a yellowish-green, sprinkled with brown dots. Stalk slender, about half an inch in length. Eye large, open, slightly sunk. Flesh fine, half melting and buttery, perfumed, gritty near the core. Season, beginning of September.

Beurré Gris d'Hiver Nouveau. (Bavay.) Syn. Beurré Gris Supérieur, Beurré de Luçon, Beurré Gris d'Hiver of Bivort, St. Michael d'Hiver.—Fruit very large, oval, flat at the ends. Stalk short, about four-tenths of an inch in length, thick; eye small, slightly sunk in a small regularly-formed hollow; skin shining, greenish-yellow, tinged with red next the sun. Flesh white, firm, juicy, and of a very agreeable flavour; it is sometimes a little gritty, when the tree is planted in a strong soil. Season, December and January. The tree is vigorous and extremely fertile. We think this variety ought to be classed among the Doyennés rather than among the Beurrés.

Beurré Lefèvre. Syn. Beurré de Mortefontaine.—Fruit very large; colour, a mixture of brown, green, and red; but its quality does not correspond with its beauty, and it soon becomes mealy. It ripens in October.

Beurré Moiret. Syn. Beurré Moiré.—Fruit large, pyramidal, yellowish green, a little tinged with red next the sun, and sprinkled with brown dots. Stalk about an inch in length, of medium thickness. Eye slightly sunk. We have not had an opportunity of examining its flesh, but we have been assured that it is of first-rate quality. Ripens in the end of September. The tree is vigorous and fertile.

Beurré Quételet.—Fruit middle-sized, broadest transversely. Stalk rather more than half an inch in length, thick, fleshy, deep brown, implanted in a shallow regular cavity. Eye middle-sized, irregular, placed in an evenly formed shallow basin. The flesh is said to be melting, buttery, and of first-rate quality, ripening in the end of October.

Beurré St. Louis.—This variety has been introduced to Lyons by Prof. Jourdan, a very eminent pomologist. It bears considerable resemblance to the Délices d'Hardenpont.

Beurré St. Nicolas.—Fruit large, obtusely pyramidal. Stalk thick, fleshy, curved, about eight-tenths of an inch in length; eye very large, placed in a shallow cavity. Skin smooth, shining, golden yellow, dotted with brown, red next the sun. Flesh pale citron, fine, very melting, with abundance of sugary juice agreeably perfumed. This beautiful and excellent Pear ripens at the end of September.

Bézi des Vétérans. (Van Mons.)—Fruit, large, turbinate, or oval. Stalk rather more than an inch in length, yellow, very slender, oblique. Eye open, in a shallow cavity; segments of the calyx erect. Skin greenish yellow, with small russet patches, tinged and streaked with light red next the sun. Flesh pale citron, tolerably fine, melting, containing abundance of sugary juice, very agreeably perfumed. Ripe in October and November, and will even keep later.

Beurré des Charneuses. Syn. Fondante des Charneuses, by corruption Beurré, or Fondante des Carmes.—Fruit large, turbinate, rounded at the eye, diminishing and slightly bent towards the stalk; the latter is about three quarters of an inch in length, thick, oblique, yellow. Skin greenish yellow, sprinkled with numerous brown dots. Flesh pale citron, traversed by some small greenish filaments, melting, buttery, with abundant juice, sweet, and very agreeably perfumed.

Bonne d' Ezée, not Bonne des Zees. Syn. Belle et Bonne de Zee (d'Albret).—Fruit very handsome, oblong, obtuse. Stalk three-fourths of an inch in length, very thick, yellowish brown with grey dots. Eye large, placed in a regularly formed wide but shallow depression. Skin of a fine yellow colour, relieved with brown and green dots. Flesh white, tolerably fine, when cut permitting the escape of a very abundant sugary juice. [According to M. Jamin it ripens in September.]

Catinka. (Esperin.)—Fruit middle-sized or large, irregularly oval, turbinate, tapering towards the stalk, which is slender, an inch and a half in length, reddish brown, with a small fleshy projection on one side at its insertion. Eye regularly formed; segments of the calyx short. Skin light green, changing to greenish yellow at the maturity of the fruit, sprinkled with numerous small brown dots, and washed with carmine red next the sun. Flesh white, tolerably fine, melting, and full of rich sugary juice, with a Crassane flavour. This handsome and excellent Pear remains for six weeks fit for use in November and December. The tree is fertile and very vigorous, even on the Quince.

Colmar d'Aremberg.—Fruit large, or very large, turbinate, flat at the eye, diminishing considerably towards the stalk, which is short, thick, oblique, deeply inserted in a cavity surrounded with projections. Eye very small in comparison with the size of the fruit, placed in a deep cavity. Skin green, changing to golden yellow at the maturity of the fruit, relieved with numerous russet specks and some greenish dots. Flesh white, tolerably fine, melting, with a very abundant sugary juice, delicately and agreeably perfumed. Ripe in November and December; it is necessary to seize the moment of its maturity; if taken too soon it is rather sharp, too late it is mealy and dry. One of the fruits exhibited was upwards of 15 inches in circumference. ‖

VILLA AND SUBURBAN GARDENING.

IN selecting varieties of Grape Vines, the first point to consider is, whether the temperature is to be maintained at a higher degree than that of an ordinary greenhouse. If such is to be the case, the higher flavoured kinds may be cultivated, but it would be useless attempting the growth of these, unless a considerable amount of artificial heat is applied. Where the latter can be secured, the following kinds may be planted: Black Hamburgh, Muscat of Alexandria, Cannon Hall Muscat, and Black, White, and Grizzly Frontignans. Where little heat can be obtained beyond that afforded by the glass covering, then the following kinds only should be employed: Black Hamburgh, Black Prince, West St. Peter's (Oldaker's) Royal Muscadine, and Sweetwater. An attempt to cultivate too many varieties in one house has few advantages, and many disadvantages. It is always better to select three or four well-known free-bearing, good kinds, suitable to the situation and temperature in which they are to be grown, than to seek variety, which is followed by questionable success. The latter is, however, an error into which the amateur is often incautiously led; for, under such conditions, he expects much, even far more than the nature of his accommodation can produce, and consequently he fails in his efforts.

The kind of plants which should be selected, and which are most suitable, are those which have been raised from eyes the previous season. It may be asked why such are to be preferred to older Vines, or stronger ones propagated by layers. The answer is that plants raised from eyes have generally much better roots, the latter being the production of the individual plant, unaided, as in the case of the layer, by the mother or stool; plants one year from the eyes are better than older ones, because the roots are not so much matted and crippled, and they admit of being planted to more advantage. The best season for planting is the beginning of April. The operation is generally but imperfectly understood. Instead of turning the plant out of the pot with the ball entire, as is frequently practised, and placing it in the soil without disturbing any portion of it, let the whole of the mould be carefully disengaged from the fibres, and then stretch the latter out to their full length on the surface of the border, not a foot beneath it, as is sometimes done. Sprinkle some of the finer soil, about 2 inches thick, over the whole, and upon this, place a few inches of half-decayed manure, as a covering and protection to the roots in drying weather; when this is completed, give each plant a moderate watering with water at a temperature of 100°; and should it appear necessary at any future time to apply water to the border, always use it at this temperature. The only remaining point in the operation is to fasten each Vine securely, in order that it may not get moved at the root.

When Vines are first planted, it is a bad plan to subject them immediately to a high temperature; rather allow them to start with the natural season. In most instances they will make a shoot sufficient to reach the top of an ordinary Vinery the first year. One shoot only should be permitted to remain on each Vine, and this should not be stopped during its season of growth, unless it exceeds the limits assigned to it. *Pharo.*

Home Correspondence.

Pine-apples at Trentham.—Your correspondent "Mirabile dictu" well deserves the thanks of all Pine growers, for the valuable information which he imparts to them. It appears from his last communication that Pine-apples of first-rate excellence are grown at Trentham; the question now arises, whether hot-water pipes or tanks are best for producing bottom-heat for Pines; a plan of the Pine pit at Trentham, with advice on the subject, would no doubt therefore prove acceptable to many of your subscribers. *A Pine-apple Grower.*

The Viper Question.—It is not, I think, generally known that other creatures, besides the viper, have been supposed to exercise the faculty of affording a temporary refuge for their young, by receiving them into their stomachs, and therefore, without feeling competent to offer any opinion on the subject, I transcribe the following sentences from Barrow's "Voyage to Cochin China," p. 144, as likely to interest those who bear to either side of this perplexed question: "A whole shark, near 11 feet in length, was cut up as bait for crayfish. Four young sharks were found alive in the stomach of this voracious animal; but whether they had been devoured by the old one, or had voluntarily fled thither for protection, was a contested point among our medical gentlemen. One declared that he had more than once seen their own young egorged from the stomach of the old ones when taken; and that once in particular he had observed a dozen sawfish (a species of shark, the Squalus pristis) springing alive out of the mother's mouth, after it had been hoisted out of the sea upon the deck of the ship. Doctor Moseley, who has written on the subject, and ought to be considered as good authority, has observed that the young sharks always retreat into the stomach of the old ones in time of danger; an observation, indeed, that was made two centuries before his time. Sir Richard Hawkins, who sailed on a voyage to South America in the year 1593, expressly says that he has frequently seen the young sharks go into, and out of, the mouth of the dam, and that he has found them in the stomach; so that Linnæus is probably mistaken in supposing that

cidedly proved that the living principle, in particular classes of land animals, is endued with the power of resisting the action of the gastric juice; but the difficulty of making experiments on the digestive faculties of the stomachs of fishes, leaves it undetermined whether the same principle is capable of exerting a greater or less degree of power in this class of animals." The strife about the viper might surely be terminated in the new reptile house of the Zoological Society, by sending specimens in the spring to breed in the commodious apartments there provided. The keepers are practised observers of the facts connected with natural history, and the authorities would probably lend their sanction to the solution of the difficulty, and so put an end to the arguments *pro* and *con*, some of which have made one suspect that the viper not only itself bites, but occasionally becomes the cause of biting in others. *D.*

The Polmaise System of Heating at Polmaise.—Have you ever seen Tonynemeda's "Garden of Curiosities?" If you have you will remember that the translation says, amongst other things which are written in the Malleus Maleficarum, you shall find that the commissioners having apprehended certain sorceresses, willed one of them to show what she could do, assuring her life on condition that from thenceforward she should offend no more in the like, whereupon going out into the fields in presence of the commissioners and many others, she made certain characters and mumbled a few words, there rose a vapour which, ascending upward like a cloud, began to thicken of itself in the midst of the region of the air, gathering and making there a black and fearful cloud, which cast out so many thunders and lightnings that it seemed something more than earthly. There are also garden curiosities of the present day well worth recording. We are instructed in certain works on gardening that gardeners should have a prophetic eye, and, to use the words of old Elspa, "These second-sighted folks should see things far off, and things to come, as clear as I can see my thumb." Now some of those spaemen undertook to tell the fortune of the Polmaise system of heating, and like Sir William Worthy, in the "Gentle Shepherd," said—

> "Weel gin ye hae a bairn
> That ye like weel, and wad his fortune learn;
> I shall employ the farthest of my skill,
> To spae it faithfully, be't good or ill."

It is well known that many said evil things against it, and that it would die in a short space. Whether these seers belonged to the school of Merlin or Michael Scot I cannot tell; but one thing is certain—I went to Polmaise lately, and found it still living and working well. This system has now undergone an ordeal of about 10 years' duration, which may well satisfy the most sceptical opponent it has ever met with, for it has had many trials, from the *expurgatio simplex* and upwards. Mr. Gorry, the gardener, informed me that this season he had cut bunches of Grapes which weighed 5 lbs., and I measured some berries that were nearly $\frac{4}{5}$ inches in circumference; the foliage of the Vines is still of an uncommon size, and the fruit is well coloured. These marks will surely not be looked upon as symptoms of a low pulse or of approaching dissolution, and we hope the enlightening power of scientific knowledge will have a beneficial effect upon the minds of those who cultivate the vegetable productions of this world, and, like the blissful influence of Christianity, put to silence those oracles whose characteristics are ambiguity, obscurity, and convertibility, and like Milton sing—

> "The oracles are dumb
> No voice or hideous hum
> Rings through the arched roof in words deceiving;
> Apollo from his shrine
> Can no more divine
> With hollow shriek, the steep of Delphos leaving.
> No mighty trance or breathed spell
> Inspires the pale-eyed priest from the prophetic cell."

It is stated in the "Theory of Horticulture," that the maturation of the fruit is dependent upon the action of the leaves and roots, and the secretions that it forms are principally derived from the former. Consequently whatever contributes to the healthy condition of the leaves and roots will have a directly beneficial influence upon the fruit, and *vice versa*. Now, will any person say, after seeing the production of one of the Vineries at Polmaise, that the leaves and roots are not in a healthy condition? If the system had been contrary to natural laws, symptoms of the violation of these laws would have been making their appearance, for we believe that when natural laws are broken, punishment in some shape or other is the certain consequence. *P. Mackenzie, West Plean, Stirling.*

Continuous Blooming Roses.—Will "Crito" have the goodness to inform a "Young Hand" what class, or individual Roses, he includes under the head of "continuous bloomers." The enquirer has a small collection of between 200 and 300, consisting of Moss, Provence, Gallica, Alba, Hybrid China, Sempervirens, Hybrid Perpetual, Bourbon, and Noisette Roses, but cannot say that any one of them possesses the very desirable property of beginning to flower in June, and not leaving off till destroyed by frost. *Dumfries, Dec.* 25.

To make "Yoghoort," or Turkish Curds.—Boil a quart of new milk for several minutes; then take it off the fire, and pour it into a bowl or other vessel, in which the yoghoort is to be served up. When the milk has cooled sufficiently just to allow of your finger bearing the heat, place the bowl in some place where it may not be disturbed. Then dissolve about a teaspoonful of leaven of sour dough,* in a couple of dessert spoonfuls of water; pour this mixture into the milk, and stir the whole well. Afterwards wrap the bowl up in flannel or some woollen cloth, to prevent the milk from cooling too rapidly, and when it is cold and appears to have thickened, take off the cloth, and cover the top of the bowl with some calico, or a napkin, of several folds in thickness, which must be brought in contact with the surface of the curds, to draw off the whey by capillary attraction. After the liquid has remained undisturbed for 12, 13, or more hours, it will be ready for use. If properly made, it should then have the consistency of jelly or *blanc mange*, so that a piece taken out of the bowl should retain the shape of the spoon. Having thus obtained yoghoort, you have only to use a dessert spoonful of it instead of sour dough, to curdle the milk; for the yoghoort made with leaven is not agreeable, the leaven, indeed, being only used when yoghoort cannot be procured, and serving, as it were, to lay a foundation; it is therefore well to put by a small quantity of yoghoort each time, for next day's use. The yoghoort is a most wholesome, refreshing thing, especially in warm weather. It is very pleasant with sugar or honey, and is an excellent addition to the breakfast-table. A small quantity dissolved in a tumbler of cold water is an admirable quencher of thirst. Having been thus loud in the praises of yoghoort, it is but right for me to add, that with some persons a taste must be acquired for eating it; but after two or three trials, it will be relished more each time. Yoghoort is so common in this part of Turkey, that one is never at a loss to procure any, to curdle milk; some natives are therefore actually ignorant how the first was made, probably imagining that at the beginning of the world, yoghoort was likewise created. A native to whom I said that it was scarcely known in England, exclaimed, "What a country! no yoghoort! but how can that be possible?" *H. H. C., Erzeroom, Turkey in Asia.*

Holes of Animals.—Those of which I spoke had "about a handful of crumbly earth at the entrance," and would freely admit the middle finger—rather more than that. I only took notice of them in last September and October (when I wanted to catch some field mice, and thought they belonged to that animal), but I cannot say when they were made. The question, when they are most plentiful, rather implies that they would have disappeared in the compass of a year; which, without my aid, I do not think they would have done. *A. H.*

Advice to Masters and Gardeners.—Towards the close of your last year's volume, "Dodman" says, "I do not recommend you (gardeners) as soon as you get to a place to begin a radical reform." The following may, however, convince him that a radical reform as early as possible after taking a situation is in many cases necessary. When I first made my appearance here (no matter where), I was hastened to a greenhouse, next to a Fig-house, then a Peach-house, &c. In passing through these, my guide often noticed "How clean everything has been left." I made no reply; but indeed I thought they had turned a glass house into a pot or a tool-shed. I next entered the kitchen-garden, where I saw a spade and a fork lying here, and a rake and hoe there. I requested to see the tool-house, where I found a few implements that had been used in the flower-garden in the previous summer, in the same dirty manner as when they were used. I immediately issued orders that all tools should be brought to the shed; after much difficulty the majority of them were found; some had strayed away among the farm labourers, and these by virtue of long possession, and a new gardener too, they considered to be their own, although they were marked with the garden mark. A radical reform was put into action, the tools were well cleaned, mended, and put in their places. I then gave the foreman directions to see that every tool was in its place, and that any man who left a tool out, or put one away dirty, should be fined 3*d*. After this rule had been put into operation, however, the old practice could not be forgotten, and in the first month I received, in the shape of fines, 5*s*. 9*d*., and in the first six months, the fine proceeds amounted to 12*s*., to which at the end of the year, I added a little more, and offered it as a prize for study. Now, however, I seldom get a fine in a month: such reform had surely been wanting here. The next place which I visited after my arrival was a plant stove (formerly a Pine stove), in which the plants stood 3 feet deep in the pit. Their roots had made their way through the pots into the soil beneath, where they had well established themselves. A radical reform was surely also wanted here; and it took place quickly. The plants were lifted out, some cut down, others repotted, the pit was filled up, new pots of course were wanted, and a good supply of broken tiles from the pottery. The conservatory was the next place I entered; here I found a collection of stove and greenhouse plants, such as Camellias, Azaleas, Heaths, Epacrises, Gesneras, Euphorbias, &c. The person who accompanied me considered the house warm, for outside the quicksilver stood at 29° Fahr., while inside it was 65°; 70° were aimed at. My employer said the Camellias had not flowered well since the season in which they were bought, although they had many bloom-buds on them; and no wonder, the heat alone would have caused the buds to fall off. But the greatest evil here was that the plants had been potted in soil taken from the bottom of a pond, without any drainage, or at least only a single crock over the hole in the pot. The Camellias had become unhealthy; the leaves had curled up, some fell off, &c. "Dodman" will, therefore, surely agree with

* Other ingredients are sometimes used instead, such as a few spoonfuls of rain-water or bezour, or a twig of Oak-leaves

might make a good sub-

me that reform was wanted in this department, for in the following season matters would be even worse. I cut the plants well in in February and put them into a gentle heat; shortly afterwards they appeared to break tolerably well. I shook the soil from the roots and repotted them; they were then placed in a heat varying from 65° to 70°, and by the end of April they had made good shoots, from 6 inches to 8 inches long. The heat was then considerably reduced, and in the beginning of June they were placed in the open air, where they remained till the end of September; ever since then they have been kept moderately cold, and now nearly the whole are well covered with flower buds. Some are in good flower, and the foliage is a good dark green. At first my employer feared the result of my radical reform, but now I seldom go two days without being congratulated on the health of the plants. Every department underwent the same treatment as early as possible, as I considered that delays would be dangerous, and that I would lose a season. "Dodman" should combine theory with practice, and then he would be in a position to advise. *Hortulanus.*

Reviews.

Episodes of Insect Life. By Acheta Domestica. 2 Vols., 8vo, with numerous coloured plates. Reeve and Co., London.

Of this singular work the first series appeared in 1848, the second has just been issued; both in covers as gay as the jewelled creatures whose history they tell. They belong to a class of writings consisting of the real and unreal, the fanciful and the matter of fact, by means of which some suppose that natural history may be rendered popular with the careless and indifferent. We subscribe to the opinion that such means deserve encouragement; and class the volumes before us among the more successful of their kind.

The author is well read and well bred. There is nothing to offend the prejudices of society nor the good taste of men of letters, nor the scientific prudery of professed naturalists. On the contrary, to a style which is very much that of a gentlewoman, is added an amount of knowledge of the habits of insects which would have done no discredit to a Curtis or a Westwood. The worst that can be said of the author is, that his (her ?) liveliness has too much the air of constraint, and his illustrations are now and then more grotesque than is desirable. In short, the book is for the drawing-room table, rather than for the study. Its gay illustrations of queer insects, queer fancies, and queer places, are sure to raise a smile if they do not provoke serious criticism, and may lead persons of active minds to enquire into truths of which Acheta's sketches are the burlesque.

The following account of "A Love among the Roses," that is to say, of the Rose-chafer, *Cetonia aurata*, in the second volume, gives as good an example of the author's manner as any extract for which our limited space will afford room.

"Young ladies, and old, and ladies of a certain age, all of you who have propensities for petting, we can recommend to you a pet—a novel sort of favourite. We will describe his person and his qualities. In figure, he is a model of miniature proportion, a match for the German Dwarfs, a rival of General Tom Thumb, and a contrast to many of his pigmy order, frightful in big-headedness or bulk of limb. He is clad in a coat of mail, which he never doffs; yet be not alarmed at his military array; for its wearer is as little formidable as certain field-marshals, the Marshal of the City, or the men in armour at the Lord Mayor's show. Never, indeed, was carpet knight more gentle; and though he wears spurs (badge of his order), they were not won in fight, nor does he ever plunge them into ladies' trains. His armour—how shall we describe it for lustre, taste, and finish? The finest suit that ever issued from the workshops of Milan, rich in the most cunning inlay of gold or steel, would prove, if compared with it, a rude, unsightly piece of workmanship. On the back of the corslet, burnished green and gold are the prevailing hues, while in front, on breast-plate, cuisse, and gauntlet, the lustre of the precious metal is predominant, mingled with changeable reflections of purplish crimson. But description fails in doing justice to an array so brilliant. Let us proceed, therefore, to its owner's character and habits, which are in all respects consonant to his polished exterior. His gentleness has been before adverted to, and he is no less distinguished for taste and delicacy. No gross and greedy appetite defiles his form or nature; for nothing coarser than honey or the golden farina of flowers, moistened by the juice of fruits, makes up his table of regalement. He loves, while yet in freedom, to ride upon a sunbeam; but would be content, when once enthralled, to bask only in the sunshine and his mistress's smile—to revel and to sleep upon a bed of roses. What think you, ladies, of this our candidate for your especial notice? In proper and euphonious parlance, '*Cetonia durata*' is the fitting appellation which he bears; but to you, probably, if already known at all, he is more familiar as 'a nasty beetle!' Yes, it is thus, doubtless, that, blinded (as some are for their live-long day) by the morning mist of early prejudice, you have been led to miscall even that beautiful creature, the *Rose* or *Golden Chafer*; with a multitude of others scarcely less worthy of admiring notice."

Those who want a couple of amusing, glittering volumes for a drawing-room ornament, or a *fête* day present, will hardly find two better suited to the purpose.

Morning Rambles in the Rose Gardens of Hertfordshire. By William Paul. Piper, London.

A useful and interesting little pamphlet of 32 pages, containing descriptions of 11 of the "far-famed Rose gardens of Hertfordshire." The object of these descriptions is to give "Rose fanciers" who live at a distance, and who might therefore be prevented from seeing these gardens, an opportunity of knowing what they contain, and the modes of growth under which different varieties of Roses flourish best. We select the following account of Mr. Warner's garden at Hoddesdon, in illustration of the clever way in which Mr. Paul manages his subjects:

"This beautiful garden is about a mile from the Broxbourn Station on the Eastern Counties Railway, and is remarkable for the diversified surface it presents. On the lawn, fronting the house, is a row of tree Pæonies, and fine specimens of the Weeping Elm, the Abies Deodara, Daphne pontica, Fern-leaved Beech, and other ornamental trees. On the upper end of the lawn is a raised terrace of considerable length, from which a fine view of this part of the garden is obtained; the Essex hills, embracing part of Nazing Common, affording an agreeable prospect in the opposite direction. A shaded walk descends, "slowly winding" to a canal, over which a rustic bridge is thrown; the scene enlivened by an excellent imitation of rocks formed of brick and cement, thrown with careless hand in the bed of the stream. Near this spot is a rustic building, which perfectly realises the idea of—

> "The calm retreat, the silent shade;"

and an agreeable encounter on a summer's day is a retreat so pleasantly shaded, suggesting, in addition to the ordinary enjoyments of gardening, ideas of coolness and repose. But our path lay onward, and we pursued it till we entered the Dahlia-garden, where we were confronted by a Gothic arch in ruins, covered with Ivy, and in judicious connection therewith were antique windows apparently dilapidated by the hand of time. On the side of this garden, adjoining the lawn, was a border of Roses, five plants deep, formed of standards and dwarf-standards. It contained the usual popular sorts. Among the new ones were Moss Laneii and Géant des Batailles, whose brilliant tints recalled the description of Lovelace:

> "Vermilion ball that 's given
> From lip to lip in heaven;
> Love's couch's coverlid."

"In the centre of this garden is a column of Roses; several plants, principally Sempervirens, being planted at a little distance from each other, and then united into one mass. The effect of this column was decidedly good, and it is worthy of imitation. There was also a plant of Leopoldine d'Orleans standing alone, trained as a weeper, the finest specimen of such we had ever seen, and a splendid Félicité perpetuelle but little inferior. We also noticed the single Ayrshire trailing over and around a large Oak, whose trunk it completely encircled and enlivened with its foliage and blossoms, and this was no mean feature in the scene. Here we paused for a moment to admire fine specimens of the Paulovnia imperialis and Bignonia catalpa, when our ears were greeted by the murmuring of a distant waterfall. And agreeable indeed it was. Nay, more; sweeter far just then than the sounds of the sweetest music, calling up in imagination all that seemed required to amplify and complete the harmony of the scene—associating the freshness of the streamlet with the fragrance of the flowers. We turned our steps thitherward, for it was not far, and found it to proceed from a neighbouring brook, by the side of which was a rustic seat, covered with Ivy, Honeysuckles, and evergreen Roses. It was neither costly nor grand; but it was natural, and fancy applied to it Spenser's description of—

> "——— an arbour green dispread,
> Framed of wanton ivy flowering fair,
> Through which the fragrant eglantine did spread,
> His prickling arms entrailed with Roses red,
> Which dainty odours round about them threw."

This was indeed a delightful spot; but we dared not linger. A few steps more, and we found ourselves in the Rose-garden. The soil, although naturally loamy, was thought not sufficiently good, and the beds were originally filled with prepared soil. In the centre of the garden is a Rose temple. The ground on which it stands consists of four beds of equal size, segments of a circle, the soil being raised, to form a mound, about 4 feet high. Twelve Gothic arches, the standards of which are of iron, 7 feet 3 inches high and 6 feet 3 inches apart, describe the outside of the circle. From these rise several rods, which meet at the top, and are united to a rod rising from the centre to form a dome. Two walks pass transversely through the centre of this temple, thus leaving four arches for ingress or egress. A seat surrounds the central support. Among the climbing Roses which covered the framework we observed—*Macartney:* Maria Leonida, creamy white—*Hybrid Chinese:* Fulgens, crimson; Bennus, light carmine; Sempervirens; Leopoldine d'Orleans, white tipped with lake; Princess Louise, creamy white—*Noisette:* La Biche, white, flesh centre—*Multiflora:* Laura Davoust, white to pink—*Ayrshire:* Ruga, flesh colour. In the same beds with the climbing Roses were interspersed various dwarf hardy kinds on their own roots, to fill up the ground. Various beds surrounded the temple, which were planted with standard Autumnal Roses, of which the following were the most striking: *Bourbons:* Cardinal Fesch, cherry crimson; Gloire de Rosomène, crimson scarlet; Le Grénadier, rosy purple: Phœnix, purplish crimson; and Bouquet de Flore, light carmine—*Chinese:* Gouvion St. Cyr, pink, and Eugene Beauharnais, amaranth—*Tea-scented:* Belle Allemande, pink tinged with fawn; Niphetos, pale lemon; Eliza Sauvage, cream and orange; and Bougère, deep salmon. There are three rustic figures mounted on pedestals introduced round the exterior with good effect. Beyond these is planted a hedge of dwarf Scotch Roses, over which we caught a glimpse of the lawn studded with various ornamental trees and plants. We wished to take a look at the Pinetum, where the specimens, though young are interesting; but time, alas! forbade. The bath garden, too, was before us, and, though not remarkable for the rarity of its plants, through this we must necessarily pass. In front of the bath is a prettily-designed fountain, playing cheerfully enough, and from which a straight walk, with a border on either side, leads to a magnificent cut-leaved Alder, whose branches are upheld with arches covered with climbing Roses. Following the bank of the canal, we pass before a figure of Neptune reclining on a rock rising from the waves, with a fountain playing over and around it. The island is planted with Weeping Ash, Weeping Willows, and Laburnums at its edge, while Scarlet Thorns and Tulip trees occupy the centre. On this side the canal is a lawn sloping to the water, with a row of free-flowering showy standard Roses in front. The next object of attraction is a span-roofed house, built expressly for the cultivation of Orchidaceous plants, several fine specimens of which were in bloom. The skill with which these plants are cultivated needs no comment at our hands: the prizes obtained at the principal flower-shows sufficiently attest the fact. In the upper garden the natural soil is gravel; consequently the flower-beds are filled with prepared soil. The lawn is decorated with flower-beds, among which single specimens of standard Roses are interspersed. We noted the following as the best: *Boursault:* Elegans, rosy crimson—*Hybrid Bourbon:* Coupe d'Hébé, pink; Las Casas, rosy pink—*Bourbon:* Queen, rose and buff; Madame Desprez, rosy lilac; and Cardinal Fesch, cherry crimson. The natural soil of this garden is gravel: consequently the flower-beds are filled with prepared soil. A plant of the Cloth of Gold, which had occupied a south wall for three years, had never flowered. By the side of it grew the single Macartney, which flowered freely, and elicited general praise. A line of arches covered with Roses and Honeysuckles crosses the lawn, and produces a very pleasing effect. Maria Leonida (Macartney) and Leopoldine d'Orleans (Sempervirens) were trained over a seat, the branches drooping naturally from above with a careless grace, which art might in vain try to imitate. A small bed of the crimson Chinese Rose "Fabvier," its brilliant flowers glowing in the sun, was the last object to rivet the attention.—At the end of this garden, adjoining the dwelling-house, is a conservatory, well stocked with flowering plants: there is also an Orange house, containing some fine specimens of Oranges and Camellias."

Miscellaneous.

The late Mr. W. Loddiges.—We regret to announce the decease, on the 28th ult., of Mr. William Loddiges, after an illness of three weeks. This gentleman has long been known as one of the most persevering cultivators of his age, and a genuine lover of plants for their own sake. With him has gone the last of the old firm of Conrad Loddiges and Sons. The business now rests in the hands of, and will we believe be carried on by, his nephew Mr. Conrad Loddiges.

Artificial Fecundation of Fish's Spawn.—As bearing upon a recent communication of M. de Quatrefages on the artificial fecundation of fish's spawn, M. Haxo says that for several years past, two inhabitants of Vosges, without being aware either of the previous publications of M. de Golstein, or of the principles announced by M. Quatrefages, have put the recommendations of this gentleman into practice, and have obtained results which have completely decided the question. M. Haxo states that since 1844, a medal has been awarded, by the Société d' Émulation of Vosges, to M. Géhin and Remi, Labresse fishermen, for having artificially hatched trout's eggs. It appears that the fishermen having for some time endeavoured to prevent the destruction of the fry of the trout in the streams and rivers of Vosges, and having often seen the female when about to spawn (which happens in November), rub her belly gently on a bed of sand, and thus force the eggs out, which she then leaves on the sand at the edge of the streams; concluded that if they could catch the females (and they are not very timid in the spawning season), force the spawn from them artificially, and then place the eggs in a safe place, after having fecundated them by forcing the milt from the male in the same way, the eggs would be sure to be hatched; the chances of their destruction being entirely removed. They tried what they could do; having caught some females in a proper state, the fishermen forced out the eggs by gently rubbing the fish's belly with their hand, then placed the eggs in a pan of clear fresh water, at the bottom of which was a layer of fine sand. They then obtained the milt from the males by a similar process; the milt was placed in the same pan, when the water became slightly turbid, a sign that the eggs were fecundated. The pan (which was an iron vessel pierced with small holes), was then put in a stream of running water, and in the following March the eggs were hatched and the pan was full of little fish. This experiment was several times repeated before the society. MM. Géhin and Remi next tried their experiments on a large scale, and endeavoured to replenish the streams and rivers of Vosges and its neighbourhood; and such has been their

success, that at present they can offer to the amateur 5 or 6,000,000 trout from one to three years old, which they have reared in a piece of water belonging to themselves; the present year will no doubt add many hundreds of thousands to the already enormous number of their fish. We may as well add that at the end of the second year, a small trout weighs 4½ ounces (125 grammes), and at the end of the third year it weighs about 9 ozs. (250 grammes). It is more particularly at these two ages that the fry (élevins) are sold by the two fishermen. *Comptes Rendus, No.* 11, 1849.

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

PROTECTION from frost demands attention in every department at this season of the year, and particularly in regard to pits and frames. These usually contain some of the most useful plants for both in-door and out-door decoration, as well as the choicer and more tender kinds of vegetables, either for present use, or in a progressive state for removing to the open ground at a more advanced period of the year. In protecting these useful structures effectually and economically, it is of the first importance to keep them, and everything about them, as dry as possible. This points out the superiority of wooden shutters over mats or any other textile manufacture which is not impervious to moisture. Another advantage is in their not lying too close to the glass, as a cavity is thus secured, which, in conjunction with the non-conductive properties of the wood, tends to prevent the escape of heat. To this we may add that they are more easily put on or removed, and prevent the breakage of glass, which is scarcely avoidable in handling frozen mats with cold fingers. We are aware they are more expensive in the first outlay, but their durability, in conjunction with the advantages here enumerated, are sufficient to silence any objection upon that head. Where mats are used, they should be hung or spread in the most convenient place for drying them during the day, as they are by this attention rendered much more serviceable in excluding frost. During very severe weather it is a common practice to place a layer of hay or straw between the mats and the glass; it is however very objectionable on account of the litter and untidyness which it unavoidably creates.

PLANT DEPARTMENT.

Even thus early in the season, there are many plants which may be potted with advantage. Amongst these we may instance some varieties of Heaths which have flowered during the last three months, and are now about to commence their new growth; and it will be better that they have previously a new supply of soil. Attention should now be paid to securing a stock of different kinds of soils for spring and summer use. These are much better if collected in frosty weather, as many obnoxious insects are at that time buried deep in the earth, and the eggs and larvæ in that part of the soil within the influence of the frost are destroyed; for these reasons such only should be selected. A good stock of Orchid baskets should now be made, that there may be no delay at the time of shifting. In this matter, every grower will please his own fancy; but no kind gives more general satisfaction than the hemispherical wire basket. They should be made of copper wire, which requires no painting. Water at this season should be applied with the nicest discrimination, taking care to avoid two very common faults; one of which is in applying it before a plant actually requires it, and the other is, supplying it too sparingly when really needed. The rule should be to ascertain that a plant is in a fit state to receive water, and then to give enough to moisten every part of the soil. Caution in the use of fire heat during frosty weather is equally necessary; a high night temperature is, above all things, to be avoided. Stoves should range from 50° to 55° at night; intermediate houses, 40° to 50°; Geraniums and soft-wooded greenhouse plants, 38° to 43°; New Holland house, the same; Heath house, 32° to 38°. The day temperature should range from 5° to 15° higher, according to the amount of light. The practised eye will readily detect many little alterations which are required, such as removing to the warmer end of each house such plants as are a little more delicate in constitution than their neighbours, or which from various causes require a more favourable situation. CONSERVATORY.—As soon as any of the flowering plants become shabby in appearance, they should be removed out of the way, to make room for others which are coming into flower. And in arranging these, let the situation of each be suited as much as possible to the nature of the plant; some kinds prefer a shady situation, and *vice versâ*. With regard to temperature, also, some require to be placed in the warmest parts of the conservatory, while others will be satisfied with a simple protection from frost.

FORCING DEPARTMENT.

PINERY.—Fruiting pits 55° to 60° by night, 65° to 75° (or 85° by sun heat) during the day: bottom-heat 80°. Admit as much fresh air as possible, moderating the quantity when the wind is very keen. The day temperature, and the moisture, should be regulated by the clearness of the weather and the amount of air which can be admitted. Do not on any account allow the moisture to be in such abundance as to condense and run into the plants. Crownless and deformed fruit are the result of moisture being allowed to accumulate in the hearts of the plants at the time the fruit is coming up. Where the pot system is practised, the plants in all stages should be examined once in two or three weeks, and a portion of those whose roots have made the greatest progress should be repotted. VINERIES.—In starting these, after washing the Vines and glass, the woodwork, and everything else about the house, should be painted if necessary. If the outside border is not already secured, this should be done before the Vines are started. Unless the roots extend into the interior of the house, the border should be covered with 18 inches of fermenting material, such as stable litter and leaves, to produce a gentle warmth in the soil before the inner temperature is raised higher than 50°. Before the litter is laid on, all loose or exhausted soil should be scraped off the border as far as the roots, and replaced by a top-dressing of charred turf, crushed bones, charcoal, and fresh horse droppings. The inside border should also have the exhausted soil removed, and top-dressed with a similar mixture. Commence with a gentle heat of from 45° to 50° night temperature, and from 50° to 60° by day. The amount of moisture should be moderate at first, and increased gradually as the plants advance in growth. Syringe freely in fine weather.

FLOWER GARDEN AND SHRUBBERIES.

Half hardy plants in pits and frames should have all the air which the weather will allow. Of plants of this description when kept in turf pits, and protected from frost by means of straw, leaves, mats, or other similar contrivances, it is often necessary, in protracted frosty weather, to keep them covered for days and even weeks. When this occurs, take advantage of the first opening in the weather to admit daylight at least: this should be done cautiously at first, by turning the mats down at the back. It is worth while to run a 2-inch hot-water pipe through any pits or frames which are constructed in a substantial manner, if they lie contiguous to any of the houses which are so heated. The first expense is not great, and the benefits of the plan will be found an ample recompense, as it does away with the expense of mats or shutters, economises labour, and secures to the plants the advantage of daylight in the severest weather. Wherever this system is already adopted, care should be taken to prevent the heat from becoming too great by regulating the stop taps according to the state of the weather, and by tilting the lights at the back during the day. Take advantage of fine weather to remove all dead or decaying leaves and plants, lest they should contaminate their neighbours.

FLORISTS' FLOWERS.

Nothing is so conducive to success in the cultivation of these favourites of the amateur than proper soil and composts; they are, in fact, "the sinews of the war," and the frosty weather is the proper time to attend to them. When little else can be done, the heaps should be turned. Perhaps the best plan is to remove the hard and frozen crust from each, allowing the surface to remain exposed; the succeeding morning adopt the same plan, till all has been frozen through. Cow manure should be gathered, which may easily be done when frozen, and laid in heaps; and if the amateur has it not of his own, it will be advisable to buy a ton or two of some farmer. Willow dust should be highly prized and sought after by those who cultivate Auriculas, and at this season of the year, there are many poor men who would gladly collect it at 2*s.* 6*d.* per sack. Decayed leaves, or an inch or two of the surface soil from plantations, or hedge bottoms, are invaluable, and a cart load of river sand will be indispensable. Night-soil should not be forgotten. Blood and the sweepings of the slaughter-house are powerful fertilisers, but should be used with great caution. Now the new year has dawned upon us, we may begin to make preparations, and though all florist flowers are, comparatively speaking, in a state of rest, yet each succeeding week will, in either one or the other, cause symptoms of excitability to appear; for instance, Tulips will soon peep; when they do, a handful of river sand, placed as a small cone over them, will be serviceable. We tried pit-sand some years ago with not very good success, the foliage having been much cankered from some impurity contained in it.

HARDY FRUIT GARDEN.

If Apricots are not already covered, it should be done as soon as possible, for their flower buds are injured by frozen sleet much sooner than is generally believed; this was abundantly evidenced last year, by the blackened anthers which might be found after severe frost in the buds which were scarcely yet unfolding themselves. A recurrence of such a season as the last would be unfortunate, and as it is quite possible, every available means should be adopted to ward off the effects of cold and wet. As Apricots are more tender than Peaches or Nectarines, it is my practice to train them first and to cover them immediately after that operation is completed. We use Spruce or Yew branches, placed very thinly amongst the shoots, and over these a canvas screen, which is readily rolled up or let down by means of lines passing over pulleys fixed in the face of a 6-inch projecting wooden coping. The object of using the Spruce and Yew branches is to prevent the injurious effects of a cold current of wind, which often sweeps along between the wall and the canvas; one of the greatest advantages arising from the use of the latter is in keeping the trees dry.

KITCHEN GARDEN.

FORCING VEGETABLES.—FRENCH BEANS: Where the old-fashioned method of forcing these in pots is still pursued, very good soil should be used for the purpose, and where the plants are up they should be carefully supplied with water. But by far the most economical method is to grow them in a bed of soil, in a pit which has the advantage of being heated at pleasure, both top and bottom, by means of hot-water pipes. The best plan of proceeding is to fill the frame to within 12 ins of the glass with fermenting materials, and upon this to lay 9 inches of rich loamy soil. The seeds should be sown in drills longitudinally, for as the surface of the soil will be upon the same incline as the glass, the plants will not shade one another so much as if planted in rows. As the plants increase in size the fermenting material will gradually sink, and when the heat thereof begins to decline it will be sustained by means of the hot-water pipes.—A sowing of Lettuces and Radishes should be made on a warm open border facing the south, and covered with a little dry Fern, which should be drawn off with a wooden-headed rake during the day in fine weather. A sowing of Parsley should be made under a south wall, where it can be easily protected.

State of the Weather near London, for the week ending Jan. 5, 1850, as observed at the Horticultural Gardens, Chiswick.

1847 was drier than any year in the present century.

Notices to Correspondents.

*** Several correspondents unavoidably remain unanswered, in consequence of the temporary absence of the editor.

ASPLENIUM FONTANUM: *W X Y Z.* It would thrive in a Wardian case; but in planting, it should be elevated between two or more rough fragments of porous stone, so that it may not be liable to have stagnant water about its roots.

BOOKS: *H B.* The Supplement to Loudon's "Hortus Britannicus" may be had of all booksellers.

CAMELLIAS: *An old double white.* They will be safe in your conservatory, however dilapidated it may be—provided they are not exposed to the sun in case of being frozen. It is not the cold that hurts them, so much as a rapid thaw. We do not, however, guarantee them against any amount of cold. They live near London in the open air under a north wall without protection; and they bore the frost of 1837-38 in cold pits, with only 4-inch walls. We should risk it.

GRAPES: *E H D.* The Josling's St. Alban's Grape is now known to be the Chasselas Musqué, one of the best sorts for a Vinery; but it is apt to crack. You will find a full account of it at p. 631, 1849.

INSECTS: *Rev. E T D.* The small larvæ found at the decayed stool of a lilac are those of some species of Tipulidæ allied to Leia. *W.*

NAMES OF FRUITS: *T S A.* 1, Beauty of Kent; 2, Wyken Pippin; 3, probably King of the Pippins; 6, Lamb Abbey Pearmain; 9, Cockle Pippin; 11, Alexander? 12, Downton Pear.‖—*W B H.* The Apple is handsome and, doubtless, excellent for kitchen use; but its name has not been satisfactorily ascertained.‖

NAMES OF PLANTS: *W T.* We do not recognise it. The bit you have sent looks like a fragment of Gelsemium sempervirens—but it is not it. When your plant is larger perhaps you will send a *good* specimen, and say from what *part* of America it comes. To say that a plant comes from America is like saying that it comes from anywhere.

SIZES OF POTS: *R R.* Proper "sixes" measure 13 inches across the top, inside measure, and 12 inches deep inside; the utmost variation from the above dimensions should not exceed a quarter of an inch. ¶

WARDIAN CASES: *E S.* Plants die in Wardian cases from one of these causes: 1, they are overwatered when originally prepared for their voyage; or 2, the case is badly made, and the seams or joints open under a tropical sun; or 3, the case is put into the hold instead of remaining on deck; or 4, the glass is broken; or 5, the case is put alongside of the engine-room or funnel of a steamer, when its contents are baked.

SEEDLING FLOWERS.

FUCHSIAS: *E. Mayle and Co.* The descriptions in "Notices to Correspondents" of the 22d of September last, were given in accordance with the flowers as received and numbered, and if any were misnumbered that must rest with the person who sent them. No transfer of description from one number to another can be acceded to. It should always be borne in mind that the descriptions given of florists' flowers in the *Gardeners' Chronicle* are given from the flowers as received, and not made up from what that or this flower may become under more favourable circumstances.*

DR. NEWINGTON'S AGRICULTURAL IMPLEMENTS.—All applications must be made to Mr. H. DUFAUR, 21, Red Lion-square, Holborn, London, Depôt for Dr. NEWINGTON'S Inventions. Lectures and Prospectus sent gratis.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.

HEATING BY HOT WATER.

THE IMPROVED "FLUE BOILER" AND FURNACE.

W. HILL begs respectfully to inform the numerous applicants for his "FLUE BOILER" of a small and intermediate size, that he shall be prepared, early in December, to supply sizes to suit every description of Apparatus, from that of 100 feet of 3-inch pipe to 2000 feet of 4-inch pipe. A List of Sizes and Prices will shortly be published. W. HILL guarantees his Boilers to be the most effective and economical of any in use.

SATURDAY, JANUARY 5, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Jan. 9—Highland and Agricultural Society.

THURSDAY, — 10—Agricultural Imp. Society of Ireland.

IF it be an old saw that nothing is more precious than TIME, modern instances there are enough, to show that it brings few things more instructive than its periodic epochs. The close of one year and the commencement of another bring with them a sort of prescriptive licence, not more for relaxation than for reflection—furnishing the busy with an opportunity and excuse, and the idle with an incentive, to look back a little, and forward a little—in a word—to think. It would seem that no occupation is so assiduous, so intensely practical, as not to be allowed breathing time between the pulling down of the old almanack and the putting up of the new, to run the eye over the Works and Days accomplished in the one, and see what application can be made of their experiences to guide with better effect the labours that are yet to come, and to apply their errors to that best and only use which consists in making them the warning-points of future steerage, as the mariner enters in his chart the each sunken rock or quicksand that his eye has caught or his keel has grazed upon.

But the near completion of the former half of a century such as the present, and the near entry upon its other—Hope may be allowed to say its *better*—half, presents to us at this time something beyond the mere annual turn-over of one of the pages that time is counted by; and certainly, of all other classes, to the Agriculturists, suggests a coincidence of change in which even the all but effluxion of a Half-century yields in importance to another Transition in which he is more essentially concerned. It is impossible at such a moment to help casting a glance back over something more than the mere events of a year, both in reference to the period reviewed and the nature of the reflections suggested by the events and changes it has given birth to.

Of all the agencies which man employs in the elaboration of his ends and purposes, the one to which he pays least acknowledgment, least honour due—is Time. He briefly admits sometimes the fineness of the day—for weather is changeable; he is thankful occasionally for a night of sleep—for he has known what it is to pass one, restless; he prizes health—because he has felt sickness; he blesses food, and values raiment—for he is sensible of hunger, and of cold; even to daylight, even to fresh air, he pays the stray tribute of a thought sometimes—for he remembers the foul faintness of the crowded court, and the stumbling darkness of some belated journey home. But the grand, *unchanging* element which clings to him at life's every instant, the viewless and impalpable essence that surrounds him more impressively, more closely, than the atmosphere he breathes—the sleeping partner that enters into every plan he makes, that will not be turned, bribed, cheated, recalled, or anticipated—this element alone he never can be taught to appraise at its true worth, or to recognise in its true proportions, as the influential and secretly presiding architect that gives to the whole edifice of his purposes and actions their final issue and development.

Yet there is no ingredient of error we more commonly entail upon the Future, than leaving out or miscalculating the effect upon events of that mysterious force whose nature we are ignorant of, and whose pressure we cannot control—the force of Time. Unwilling as we often are to judge, fairly and comprehensively, of the Present by the history of the Past, there is no limit to the incautious haste, to the audacity with which we rush, into a judgment of the Future from the Present.

But it is most strange of all that this should be a not uncommon fault of the Agriculturist. If there is a human calling or pursuit which deals with Time and its pregnant uncertainties, more emphatically and on a larger scale than any other, it is that of the agriculturist. If to the working hand or mind of any being the lesson is ever rife, palpable, and pressing, written upon earth and sky, and all the elements he waits upon, mixed with every hope and waiting upon every discouragement—the lesson *not* to pronounce too hastily upon the future, not to be over sanguine nor depressed beyond measure, it is to his. Yet it is a fact not less remarkable than true that, practically, there is no branch of industry so prone to the extremes of Fear and Hope, and to the exaggeration of each extreme. It would seem as if the Seasons themselves, instead of the *experience* of the Seasons, guided the impulses of alternate expectation and despondency observable in that business to which of all others it should seem that Nature herself is most lavish of steady and moderating instruction.

Why is this? Why is it that the broadly based confidence produced by Trade calculation and the habit of mind engendered by it—which qualifies the uncertain period of high prices and prosperity, and supports by a more cheerful assurance the season of pressure—moderating both by a comprehensive and *willing* review of all the known causes that have been at work to produce the one, and *are* at work to produce the other—are not only not acquired or encouraged, but are so observably rejected from the counsels of the agriculturist?

To point back over the three extraordinary years that lie behind us, the first, remarkable for a general scarcity over Europe, the second for an almost general revolution — destructive not more to political order than to Trade and Commerce, the third for a reactive abundance of the Harvest, before paralysed Trade, and its resulting demand, had, except in our own Country, and only lately in our own, had time to recover; and again, withdrawing our view to our own Country, to aggravate the list of transitional causes by a single glance at the history of the Railroad Mania, which pawned into circulation more than all the spare Capital of the Country upon the employment of a legion of beef-and-mutton-eating labourers to be thrown out of work again by the failure of the schemes that employed them—to recapitulate these unprecedented circumstances, in explanation of a season of comparative trial to the agricultural interest during the latter part of the period, would surely be no difficult or ineffective task, did it find a willing or considerate ear.

Why does it not? Why does the simple narrative of obvious and acknowledged facts in explanation of existing phenomena meet with unwelcome and suspicion, as if the ear addressed was unaccustomed by long habit to the simple exercise of the judgment upon the facts presented to its review?

Let the half-century that lies behind us answer that question. Let the habit of mind that it has seen engendered into the very heart and pith of agricultural discussion, poisoning and distorting at every turn the circulation of its free enquiries—enquiries which yield in value as well as interest to none which have this earth for their sphere, and man for their interpreter — settle that question with itself as best it may. To the progress of Time we look forward with a well-founded and daily confirmed hope, for a gradual development of facts and influences which shall restore both the temper and utility of those discussions which have for their basis our national progress in agricultural knowledge and practice.

To those minds which are able to regard the depression of a season as *a consequence* of past events, and to look boldly and widely around them for the true causes of future prosperity, we repeat that the aspect of the present, in every surrounding branch of industry and trade, is pregnant with the most solid elements of encouragement and hope. And if there is one ground on which, more than another, we welcome these indications at the opening year, it is for the restoration of that state of mind and feeling to which alone the pure topics of Agricultural progress can be usefully addressed.

In no country of the world is Husbandry-practice and knowledge more *unequal* than in our own. The same County, the same Parish, presents *the best* and *the worst* divided only by a hedge. This is the very condition, of all others, to which the diffusion of practical knowledge is the most specifically, the most urgently applicable. It invites our efforts not more by the need, than by the encouragement, that such a condition especially presents. What foreigners who have visited England have uniformly said of its educational state—that it discloses the highest and the lowest, with the widest interval between them—might be applied with redoubled application to its Agriculture. Discouraging as the one side of such a picture may be, it is however confirmed by all experience, that this is the very condition from which the race of improvement commonly takes its date of most rapid progress. The past ten years have afforded an earnest of that which may be made in a given time; but they who have in this short interval done and learnt most would be the last to assert that nothing more remained to be accomplished, either in the theory or practice of the art. Every step attained suggests the next that must be taken, and tends to show that the ratio of progress is itself progressive; that impediments and discouragements, let them arise from whatever quarter, or appear at first however formidable, are in their very nature temporary, while the advancement of that intelligence and skill that overcomes them is, as far as any human thing can be, irresistible and eternal.

THOUGH Turnips may be grown and consumed on the farm with profit, yet experience has decided that Turnip culture is chiefly beneficial as affording the most approved method of renewing the impaired fertility of the soil after cereal crops have been taken; but amid all the advances which we have made in agriculture, it appears that a ton of Turnips is worth no more now for feeding purposes than it was nearly a century ago. The experience of the Colchester sheep-feeder, which Mr. MECHI mentioned at a late meeting, who was consuming Turnips at the rate of 3*s.* 6*d.* per ton, shows this; and it must also be recollected that this was probably under very favourable conditions, for practical men know well that the feeding qualities of Turnips are much greater when grown on rich land (such as that on both banks of the Stour in Essex and Suffolk or the warp loams of the Waveney) than they are on the hungry sands and gravels, or peaty fens, which adjoin. These qualities, however, are often entirely disguised by the practice of giving large quantities of highly nutritious food in addition.

The experience of Scotch feeders approaches very nearly to the same result; 3*s.* 6*d.* to 4*s.* 6*d.* per ton is the price which is commonly given for Aberdeen yellow Turnips when eaten on the land by sheep, without any artificial food. Here also good soils are always sought after, as they produce far more nutritious roots. In the Lothians a great many farmers let out their Turnips to be consumed, chiefly in the yards, by cattle, and 7*s.* per ton may be estimated as the usual price paid; but this does not give their real value, as the feeder's profit requires to be added. Oilcake is commonly given to the cattle, but usually only for finishing the fattening process, and then the common allowance given by the grower is 25 per cent. of the amount consumed. Under these circumstances the green crops are disposed of with little anxiety and risk to those who raise them, and it is questionable if they could make as much of them as those who make this their special business. That Turnips should be worth more, when consumed by cattle under shelter, than when done so by sheep exposed to all weathers, is quite consistent with sound theory; for there is no reason to believe that the constitution of the ox is not as well adapted to extract as much meat from the same weight of roots as that of the sheep; and farmers should fully consider the conditions which they subject them to, before they exclaim, with Mr. MECHI, "Bullocks are most ungrateful fellows, and no favourites of mine."

It is not an uncommon practice for English farmers to give 14 lbs. of cake daily to an ox, or other feeding substances in the same proportion, and it is no wonder that the whole roots consumed frequently go for nothing, and sometimes a considerable quantity of the artificial feed must also stand on the wrong side of the ledger. It is very questionable whether this extreme system can be vindicated, and it affords matter for suspicion whether it answers the main end—that of rapid accumulation of fat and muscle. Dr. THOMSON'S experiments clearly established the fact that less effect was actually produced by increasing the supply of artificial food to

cows, beyond a much more moderate quantity than stated above; and although we have no direct experiments on the subject, analogy would lead us to believe that the maximum effect is attained as soon in the less vascular system of the ox. The organs of assimilation appear to become blunted by such a process, and a large portion of nutriment must pass through the system undigested. That sheep should be greater favourites where cattle are so treated is easily explained from the fact that they will not consume so large an amount of highly nutritious food according to their weight. There is little reason to doubt that WARNES' mode of feeding, or certain modifications of it, would yield much better results as regards profit; and the box system being so well adapted to prepare and preserve the manure, might go far to compensate by its increased richness for the cost of a large quantity of cake, &c.; but where it is too frequently subjected to waste, both by being washed and by fermentation being carried too far, our experience in the consumption of 100 acres of roots by sheep and cattle, for some years back, gives about 7*s.* per ton after deducting a moderate bill for artificial food; and we have no faith in the policy of increasing that to such an extent as would probably sink the whole value of the roots in the manure heap. At the same time our experience is quite in accordance with the results of Mr. LAWES' invaluable experiments, which show that the feeding of stock, when properly managed, will furnish us with ammonia (the most important element of waste) at a cheaper rate than guano or any other artificial manure.

An extended inquiry over the best farmed districts in Scotland would show a small expenditure for artificial food and manure in comparison with Lincolnshire; in the latter the cost of maintaining the fertility of the soil would be much greater: and in this lies the main disparity in the two systems—and by this being overlooked and not apprehended, much Scotch capital has been wrecked on English soil. Spring crops, where the circumstances are favourable, can be grown at much less expense than autumn crops, and this is one reason that as high rents can be paid in Scotland while the gross produce is smaller. "W.," who wrote on this subject in our last year's volume, must be aware that the 4-course shift in Berwickshire is a totally different system from what goes under the same name in Norfolk. There the crops and rotation would probably be 100 acres Grass, 100 Oats, 100 Turnips, 60 Wheat, and 40 Barley. If the Berwickshire farmer could adopt the Norfolk course and practice, without increasing his expenditure—the greater extent of the higher priced products would go far to compensate him for the reduction which has taken place in the prices of grain.

Leases of 19 and 21 years prevail over Scotland, which have done much for its agriculture—but something more is now required, as the practice of allowing the land to become deteriorated towards their termination is quite notorious, and much capital is withdrawn from the soil, to the injury of all parties—so much so, that the Lincoln farmer, under his yearly holding, with an equitable tenant-right, is in as good a position, and his capital as securely invested. It appears to us that the subject of compensation for unexhausted improvements is the most important question at the present time, which affects the capital directly engaged in cultivation. It would be much for the benefit of landlords and tenants that they were fully convinced that 'high farming' and 'liberal covenants' should go together. *R.*

THE LABOURER.

As it is to be greatly feared that there may be a want of work for labouring men during the present winter, I have been looking through the accounts of a little attempt which I made this year to improve a small piece of unproductive Grass land opposite to my house; and as the result seems such as to encourage the employment of spade labour on a small scale, the details of my proceedings may perhaps be of service at this time. Last year I observed the quantity of hay made on this plot of ground, which is just about two-fifths of an acre, and it did not half fill a cart. The turf was pared off with a breast plough in August, and a crop of stone Turnips obtained by ploughing and harrowing without manure. The ploughing and harrowing was kindly done for me gratis, and the seed I saved myself, and it was sown by my own man; but setting a price on each operation, it would stand thus—

	£	s.	d.
Breast ploughing two-fifths of an acre, at 1*l.* ...	0	8	0
Ploughing, harrowing, and sowing white Turnips with seed-barrow	0	10	0
Hoeing Turnips	0	3	0
Expenses of first year	£1	1	0

Which may be reckoned as repaid in part by the crop of stone Turnips, but I will put no value upon them I should have mentioned that the turf, when dry, was not burned, and merely the ashes spread on the land, which practice appears a great waste of valuable manure, but was carted off and laid in a heap with layers of yard dung. This heap we turned over once during the winter, and about 3 cwt. of salt mixed with it to kill any grubs, &c. At the end of last January I commenced breaking up the ground with the fork and pick-axe, and now we soon found the reason why the Grass had always been so short on this spot, for it turned out a complete stone-quarry. The ground a few inches below the surface was paved, as it were, with the flat building stones of this country, which had formed the walls of old houses; amongst which we found remains of all ages, Roman and other coins, an arrow-head and other pieces of iron work, and a curious leaden seal, said to be of the time of Edward I. Here was a very different operation from what I had contemplated, for all I had thought of was merely digging the ground over thoroughly two spits deep. However we stuck to it, and I paid for grubbing, wheeling off, and stacking up 140 cubic yards of stone. At any rate this insured good deep cultivation. After the ground had settled down a little, we carted upon it 20 single horse cart-loads of the half-rotted sods and dung from the heap, and about 10 loads of fresher dung; *i.e.*, in all, 30 single-horse cart-loads of manure, or 75 loads to the acre. Here, then, was deep cultivation and liberal manuring. The loads of dung were all well covered with earth till required to be spread, so as to retain all their virtues. Being then spread a little at a time, to prevent loss, it was dug in about the middle of March. After lying some days, the dry weather being favourable, the ground was all raked over and broken fine with the back of the rake, the stones and weeds collected in heaps and wheeled off. A simple marker was made to mark out the drills at 2 feet apart, and the points can be shifted to mark drills at any distance from 9 inches to 6 feet. When once the first drills were drawn straight by a line, all the rest were easily marked by this implement. A man by treading along each mark with one foot before the other on the deeply-worked ground made a hollow sufficient to contain the bones, ashes, and seed. In these hollows or depressions bones dissolved in sulphuric acid mixed with sifted coal ashes were sprinkled with a shovel, and the seed sown on the bones, and covered very lightly with a rake, the man stepping on the drill as he covered it in. Thus a somewhat firm seed-bed was made, and the seed was covered very shallow. March 24 we began sowing Parsnips and Carrots, and early in April, red Beet. On April 25 commenced sowing Long Red Mangold Wurzel, to the produce of which I am about particularly to allude, which was followed later by sowing green top Swedish Turnips. The Mangold seems to have suffered less from the severe drought of last summer than the other crops, for, though all good, they were at one time very much checked by the dry weather. Nov. 21. The Mangold was taken up, and one row—selected by chance, and which my man said was the worst in the field—was kept by itself and weighed. The row was 110 feet long, in which there were 102 roots, and these, cleaned and topped, weighed (exclusive of the basket) 604 lbs. This gives 6 lbs. as the average weight of each root, without the top, and the rows being 2 feet apart, is at the rate of 53 tons 6 cwt. to the acre, in which there would be 20,196 such plants. The tops, besides, furnished several meals to some pigs. Out of the crop I picked 12 plants, which were exhibited at the show of the Cirencester Agricultural Society, and these weighed, with their tops, exactly 13 lbs. each on the average, which if it could be carried out through a whole crop (and why not?) would make double the produce actually realised. I may observe that my roots of the long red sort were beaten in weight and size by some long yellow ones shown at the same time by Mr. Cook, of Stratton, a neighbour. I will now give, as nearly as I can, a statement of the expense of the operations I have described, and of the return realised, supposing the whole had been Mangold Wurzel:

	£	s.	d.
Expense incurred as above, in 1848	1	1	0
Carting off turf, and laying it in a heap; 2 days a horse and cart and man	0	10	0
5 loads of dung and salt, at 4*s.*	1	0	0
Turning heap of sods and dung, 2 days at 1*s.* 6*d.* ...	0	3	0
Grubbing stones, 65 days at 1*s.* 6*d.*	4	17	6
Wheeling off 140 yards of stone, at 2*d.*; spreading and digging in dung, raking, &c.	4	12	6
10 loads of fresh dung, and 20 do. of sods and dung—*i.e.* 30 loads carted out, 2 days horse and cart ...	0	10	0
10 loads of dung, at 4*s.*	2	0	0
Bones, acid, ashes, and seed	0	8	0
Sowing	0	3	0
Hoeing, singling, and cleaning	0	10	0
Taking up crop, at 1*l.* per acre, ...	0	8	0
Carting home, 1 day	0	5	0
Rent and taxes, at 3*l.* per acre	1	4	0
Expenses on 2-5ths of an acre	£17	12	0
Deducting the value of the stone got, which is 140 yards, at 5*d.* per yard	2	18	4

We have as the expense incurred on 2-5ths of an acre £14 13 8
Or at the rate of 36*l.* 13*s.* 9*d.* per acre.

If the expenditure of 36*l.* 13*s.* 9*d.* had been incurred in raising a crop of 53 tons 6 cwt. of Mangold Wurzel, it would have cost a little under 14*s.* per ton, which is not a high price for that root, if it is grown in the neighbourhood of any considerable town. In short, this very high rate of expenditure nearly covers itself, besides improving the land very greatly, whether for subsequent tillage or for laying down again in Grass. It is evident that the expense above detailed is far greater than in common cases would be incurred; and if Carrots were made the principal crop, though not so heavy a produce, the crop would always be saleable. The reason I have undertaken the disagreeable task of bringing my own experience before the readers of your Journal is, that I believe a great boon may, by imitating my little example, be conferred, at very little, if any sacrifice of expense, upon industrious labourers, who might otherwise be forced upon the rates, to the general injury. I have in a former year, in your Journal, recommended anonymously this same resource of spade labour, and the examples which have been reported since fully bear out my views of its practicability and success. In any parish, then, in which there are men out of work, instead of putting them to unproductive and useless employment, or allowing them to become paupers, let an individual, or a few joined, rent a piece of poor pasture, hire a trustworthy man to be foreman and superintendent of the labourers, drain it, if necessary, under an agreement with the landlord, and proceed by paring off and making manure of the turf, and deeply working the soil, to prepare it for a root crop to be sown in spring. At that time the sods, being partly decomposed, may be dug in, and a good dressing of superphosphate of lime applied with the seed, if there should be a difficulty in procuring or carting to the spot town or other more bulky manure. All the labour to be paid for equally, to married or single, by piece. The money advanced in this case as weekly wages may be regarded only as a loan to the labourers, the repayment of which is secured by its investment in the land, and will surely be received back again next autumn, together with the grateful thanks of the labourer, the approbation of the ratepayers, and above all, the approval of a good conscience. I hope the above details may induce many to stretch out a hand to enable the honest labourer to keep himself and his family out of the workhouse through the coming winter. *Thomas Tancred, Cirencester, Dec.* 17.

PITCH PRESERVES CORN FROM THE WEEVIL.

By M. CAILLAT.

In a late number of the "Comptes Rendus" was a letter from M. Barruel on the action of carbonic oxide on weevils, and on using this gas for their destruction. Some journals, and amongst other *l'Echo Agricole*, published lately another method for destroying these insects, discovered by Mr. W. Little. This is by employing ammonia, which, according to Mr. Little, kills the weevils the instant it comes in contact with them. I have proved, however, in the presence of several witnesses, that ammonia does not instantly kill weevils; for after being exposed for several minutes to ammonia, either gaseous or liquid, they get on their feet and run with ease when removed from this caustic alkali. The prolonged action of ammoniacal gas, carbonic oxide, carbonic acid, or of any other irrespirable gas, of course eventually kills these insects. I do not know what sort of an apparatus fit for all cultivators, large or small, rich or poor, would be adopted by M. Barruel for applying carbonic oxide, or by Mr. Little for ammoniacal gas; but I beg to state that there is another substance less costly and of much easier application, this is pitch. The utility of this substance against weevils is well known to many agriculturists and corn merchants.

I placed in a vessel holding about a quarter of a pint, and well corked, three live and strong weevils; I at the same time introduced a little flask containing pitch. They soon began to grow uneasy, then fell on their backs and struggled with their feet, but without being able to get up; at the end of 15 or 18 hours they perished. The mere smell of the pitch, in a closed space, is thus fatal to them. If a little pitch be smeared on the upper part of the closed vessel in which the weevils are, they die more quickly. That pitch will drive away these insects, and preserve grain from their attacks, is certain. My father had his granaries, his granges, and the whole house infested with weevils, which found their way into the cupboards and among the linen. He placed an open tub smeared with pitch in the grange and the granaries; after a few hours thousands of these creatures might be seen running in all directions away from the place where the tub was. By passing the vessel through the house from story to story, it was soon completely cleared of these troublesome and noxious creatures.

The agriculturist who wishes to get rid of weevils, has nothing to do but, as soon as he is aware of their presence, to pitch the surface of some old boards and place them in his granaries; the pitch must of course be renewed several times in the course of the year, in order to keep the insects away. *Comptes Rendus.*

TULL'S HUSBANDRY.

HAVING made a trial of Tull's peculiar method of growing crops, I have reason to think it deserves more attention than it has received. One recommendation of it must be valuable in these times, namely, that it requires extraordinarily little capital, and yet seems capable of producing better crops than are supposed to be the average of the whole country. Another recommendation is, that it requires a considerable quantity of farm labour. Its great saving consists in seed, and in its doing away with the necessity for green crops and heavy manuring. To Tull we are indebted for the drill and the horse-hoe, whence it seems but reasonable to infer that the inventor of such valuable instruments can justly claim our attention to that third thing which completed his peculiar method of husbandry, which he assures us he adopted so many years with success, but which his modern panegyrists are prone to pass by as some "odd notion" or monomania, which "'tis a pity" so great a master of agriculture was affected with. Some of the readers of the *Agricultural Gazette* may

require to be told what that peculiar method was. It was this—the land was ploughed into ridges 5 or 6 feet wide, and two or three rows only of corn were drilled on each ridge, occupying about the space of a foot or 14 inches on the top of it—the wide spaces between two sets of rows were frequently and deeply ploughed while the crop was growing, while the narrower spaces on the tops of the ridges were hand-hoed—and a constant succession of corn crops was thus obtained without dung or fallow. The exclusion of the dung was only on account of its cost, for Tull always admitted that his method would grow greater crops with than without it. Only he maintained in theory, and defended it by his many years' practice of the method, that good crops might be obtained without manure, if there were but sufficient tillage while the crop was growing. The exclusion of manure, then, is not necessarily a part of Tullian practice; but because there is evidence that the present average crops may be obtained without manure for some seven or eight years at the very least, and because the production of manure requires an amount of capital on the part of the tenant, and also on the part of the landlord in dividing his farms and building suitable accommodation for cattle, which capital neither tenant nor landlord can, in but too many cases, command; therefore what I propose is this—let a certain portion of the farm be cultivated in the Tullian manner, that is, with annual crops of corn; the horse, the plough, and the cart or waggon, is pretty well all the capital required for it. Let the straw be appropriated to the rest of the farm in accordance with present or any other arrangements that may be thought better. The justification of such an arrangement between landlord and tenant depends on the merits of Tull's method, to which I will now proceed.

Tull's theory was that perpetual good crops of corn might be obtained without manure, and he states that he had 12 successive good crops of Wheat by his method, as above described. His theory and his reasons for it I should be glad to be permitted to discuss in the columns of the *Gazette*. All I can venture to say upon it is that 12 successive good crops do not prove that the theory holds for perpetuity. But as Tull says the land was manifestly improved when he sowed his 13th crop upon it, we may infer that there is some undetermined number of years, different in different soils, up to which number at all events the land will annually become more and more fertile under this system, after which it may be that constant cropping without manure will impoverish the land, however much tillage only it receives. Thus much, I think, may fairly be inferred from Jethro Tull's statement. But is the statement itself correct, or what did he mean by good crops? On this point he has not left us many particulars. He says he often weighed the produce of a yard in length of a ridge with only two or three rows on it, and found as much as 18 or 20 ounces of Wheat, which, the ridge being 2 yards wide, is about 6 quarters to the acre; and he tells us—"I do not know that I ever had an acre yet, that was tolerably well managed in this manner, but what produced much more" than 16 bushels of Wheat. Again, "He was desired," he says, "to take an exact account of the product of an acre in the middle of a field of 25 acres of horse-hoed Wheat," and it "yielded 29 bushels and 6 gallons of clean Wheat." He then states some purely accidental causes in the harvesting of it which prevented the crop from being 32 bushels. He adds, "It had a good crop of Wheat the preceding year drilled in double rows; and the year before that had a crop of Barley drilled in triple rows; the ridges always of the same breadth. All these crops were horse-hoed, but in the year before the first of these the field had a crop of sown black Oats; so that there were four successive crops without any fallow or dung. And there is now growing a fifth crop, being Wheat, likely to be much greater than any of the precedent, if the year prove as favourable."

I think, then, that it may be concluded that Tull annually grew above 3 quarters of Wheat to the acre. His land was on chalk, and he says, "being almost all hilly was thought too light for Wheat." Mr. Cobbett, in his Introduction to "Tull's Husbandry," relates an experiment of his own in 1813, which, he observes, "was the finest year for Wheat in the memory of man." He drilled 2½ pecks of spring Wheat per acre, on land "in a very good state and very suitable for the crop," in single rows on 3 feet ridges, and had at the rate of 33 bushels and 6 gallons per acre. Between the ridges he sowed the same Wheat broadcast at the rate of 3 bushels per acre, and had a crop at the rate of 36 bushels and half a gallon per acre. He also relates that Mr. Beaman had grown Tullian Wheat, without manure, for six years successively on "a marly clay" in Herefordshire, and had averaged 23 bushels per acre.

The only other experiment I have been able to find of this system is mentioned in "Cobbett's Register" for 26th Oct., 1833. It is there stated—"In the year 1824 Mr. Box sowed an acre of Wheat on the principle laid down by the late Mr. Tull, on land of a middling quality. This acre in 1825 produced eight sacks; in 1826, 8 sacks; in 1827, 7 sacks 2 bushels; in 1828, 4 sacks 1½ bushel; in 1829, 5 sacks; in 1830, 7 sacks 2 bushels; in 1831, 6 sacks 2½ bushels; and in 1832, 7 sacks 1 bushel; making in the whole 54 sacks 1 bushel, or on the average of years, 6 sacks and a trifle more than 3 bushels. Mr. Box had also several other crops of Wheat on the same principle, which has averaged as much as on the narrow drill system. Last year his Barley averaged 4 quarters 6 bushels per acre, and his Oats 6 quarters per acre. Mr. Saunders here produced a sample of Mr. Box's eighth year's Wheat, which looked remarkably fine; and also observed that he had two pieces of Wheat this year, sown on land of extremely bad condition, the produce of which was likely to be 7 or 8 sacks per acre. Mr. Saunders said that he had closely watched Mr. Box's acre, which was producing the ninth crop without dung. The land was very poor, and certainly not extraordinarily well attended to; but so satisfied was he (Mr. Saunders) of the advantages of the system, that he commenced at Michaelmas sowing 8 acres of Wheat and 6 acres of Barley, all without dung; 2 acres of the Wheat were very fine, and the Barley sown on the best part of the land remarkably good." These experiments were tried at Market Lavington. It is much to be desired that we could get further accounts of subsequent success or failure. And now I proceed to relate my experiment last year. It was on 97 poles of a Wheat stubble in very ordinary condition. Exclusive of the headlands, which were uncultivated, there were 91 poles, and the produce was 11 bushels, or 19½ bushels per acre. The ridges were 6 feet wide, and only half a peck of white Wheat dibbled about a foot width on the top of the ridges. Either it was so badly dibbled, or the wireworm made such ravages, that at harvest there were but 10 plants in a yard of length, equal to 5 plants for every square of the field exclusive of headlands. I ascertained this by actually counting the plants over the entire of the five longest ridges, and the remaining six were to all appearance the same. The tillering was most beautiful, and the ears wonderful, often containing 80 grains of corn. And yet there appeared room for 10 more similar plants on every yard of length. This year I have drilled three rows on the tops of similar ridges, lying over the open furrows of last year, and intend hoeing out the middle row in the spring, except where I find vacancies in the outside rows. The experiment is extended to 1 acre, and 3 pecks of seed were drilled upon it. Had I done so last year, I doubt not I should have had as good crops as those of the foregoing experiments. Thus much must suffice for the present as to the probability of a crop by the Tullian method. If agreeable I should be glad to go further into the subject. I will now conclude with giving my estimate of the cost of thus cultivating an acre.

I assume wages to average 1*s.* 10*d.* a day throughout the year, and the cost of a team of horses to be 8*s.* a day for the number of working days in a year, which I take to be from 200 to 220. The wages of the boy who drives the plough I assume to average 6*d.* a day. The first ploughing into ridges may be done in the customary way, and took me 10 hours or 1¼ day to do an acre. The hoe ploughings consist in going as near to the Wheat as you can without ploughing it out, and turning one deep furrow from each side of the double or treble row, whichever it may be; and then the next time turning these furrows back to the rows. Mine were hoe-ploughed but three times, the two first from the row, the last to it. Four hoe-ploughings would be better. They must be done with a swing or a one-wheel plough, and two or three horses at length, according to the land. Four hoe-ploughings of an acre will take up a day and a half. I gave two hand-hoeings to the tops of the ridges, but expect it will be unnecessary for the future as far as weeds are concerned, so extraordinarily does the Tullian method clean the land. No garden can surpass it. Couch, however, must be got out in the usual way, and once out this method will keep it so. I charge each cultivated acre with 1*s.* 6*d.* to pay the rent and taxes of the headlands, and the fields ought to be made large enough not to exceed this. Observe that I have averaged the rate of wages throughout the year, which accounts for such an item as reaping being only 3*s.* 8*d.* per acre. The following, then, is my estimate of the cost of cultivating an acre of corn year after year in the Tullian method:

	£	*s.*	*d.*
Ploughing into 6 feet ridges, one day and a quarter—man at 1*s.* 10*d.*; boy at 6*d.*; three horses at 8*s.* p. day	0	12	11
Four hoe-ploughings, one day and a half	0	15	6
Harrowing before drilling, a single time—man or boy and one horse, one-eighth of a day	0	0	7
Drilling—man, boy, and team, one-eighth of a day ...	0	1	4
Harrowing after drilling, a single tine	0	0	7
Rolling in spring—man or boy and team one-eighth of a day	0	1	3
Hire of drill	0	1	6
Hand-hoeing twice, three days	0	5	6
Reaping two days	0	3	8
Carrying and rick-making—man, boy, and team, one-third of a day	0	3	6
Thatching—one man one day	0	1	10
Taking in rick, though less than carrying and rick-making, say	0	3	6
Threshing and winnowing 3 quarters, seven days ...	0	12	10
Seed, from 2½ to 3 pecks	0	4	0
Charge for headlands	0	1	6
Marketing 3 quarters—man, boy, and team taking 10 quarters a day	0	3	2
	£3	13	2

Assuming the produce to be 3 qrs., at 2*l.* per qr., here is a balance of 47*s.* to be divided between rent, rates, tithes, and profit, besides the straw, of which my experiment gave 46 trusses per acre. If any one thinks 3 qrs. per acre is but a low figure in these days, let him exchange his straw for manure and produce more. But it must be very high farming by cattle feeding that will surpass this of Tull's for amount paid in labour, rate of profit on capital, and surplus left for rent, as well as human food sent to market, if my estimate of cost and produce at all approach correctness. My very knowing work-people pronounce my Tullian Wheat to be 4*s.* a quarter worse than that sown in the common way. I can only say I have had it mixed with an equal quantity of old red Wheat and ground into "whole meal," which has made the lightest and sweetest brown bread I have ever tasted. But, say my masters, who declare this to be the maddest of schemes, it is deficient in flour. Be it so, and put it at 4*s.* a quarter less than the average; still will this estimate bear a comparison with the general cultivation of the country. I believe I have overrated the costs, for it is drawn up with the prospect of having land thrown upon me, and with the intention, in that case, of cultivating an entire farm upon this Tullian method.

Amicus Tull.

AGRICULTURAL PROGRESS.

Poor Mr. Mechi! I wonder he is not agriculturally defunct. Fired at from all quarters, attacked sometimes by landlords, and at others by tenants, nothing but the shields of honesty and truth could have saved him from utter annihilation. As Mr. Compton of Water Newton has chosen my name as a peg on which to hang a string of very sensible and truthful remarks, I will follow his example, and put before your readers a sort of "*olla podrida*" of agricultural reflections, on past and passing events in agriculture. It appears to me that the great curse of agriculture has been and is even now "ignorance." I mean a want of agricultural knowledge, not only in the mere practice of agriculture, but of the great and sound principles of the duties of landlords and tenants, under our altered circumstances. I believe in the majority of cases (for there are delightful exceptions), landlords were satisfied to let their farms on the old feudal principle of hereditary tenure, and hereditary subservience, moral and political. The remark applies equally to Whig, or Tory, or Liberal. It was the custom of the country. The vote at an election and the game on the farm were alike sacred and inviolate. Leases (when granted, which was not very often), were drawn up with meshes enough to catch a dozen stray farmers, and therefore there was no chance for any errant spirit to escape from their encirclement.

In one case within my knowledge, it was specifically agreed that the banks and fences should be at least 31 feet wide, and the Beans remain uncut, until the 1st October, so as to facilitate sporting. The absurd restrictions in leases might be illustrated, and multiplied *ad infinitum*, but this is unnecessary. Now, this was all natural and fair, so long as the land predominated over population, that is, so long as there was no difficulty in feeding and employing the population. The farmers readily acquiesced in the system; they held their lands on easy terms, and although doing pretty comfortably, always pretended to be very poor. In fact it was deemed criminal amongst them to let landlords know anything of practical agriculture, and I know, even now, some good honest farmers of the old school, with primitive habits, who gravely consider public agricultural meetings to be the ruin of agriculture. But within the last half century, how great has been the necessity for a change! How imperative that our prejudices should give way to the pressing demands of altered circumstances! Like the compound multiplication of horseshoe-nails, the overwhelming increase of population (acres do not multiply), has reversed the whole system. The craving demands of hunger and the gigantic foreign imports, to supply those cravings, have appalled our statesmen, our landlords, and our tenantry. The letting and tenure of land will now assume the stern character of business. Already men of capital and intelligence, who treat for unimproved lands, with poor or embarrassed landlords, dictate such terms as will enable them to apply a much larger investment of capital and human labour, with a prospect of remuneration and security.

A new supply of capitalists are now presenting themselves in the agricultural drama, as tenants and as landlords. I mean the surplusage of trade, commerce, and manufactures. Wealth is not (as a general rule) accumulated by landlord proprietors, and farming is too slow a business (especially as hitherto managed) to permit any great aggregation of wealth; but the gigantic enterprise, zeal, energy, discrimination, and wisdom of our merchant princes, manufacturing lords, and busy traders, have enabled them to tax the world, and fill their coffers to overflowing. In them we find the present purchasers and new possessors of landed estates, great and small. Let us hope, also, that in their progeny will be found, agriculturally, both as landlords and tenants, a mercantile treatment of the affairs of the soil. It is very important that they should acquire agricultural knowledge. Let us hope there will be more agricultural colleges. Agriculture is a slow business, and a keen one, too, full of nice economies and narrow margins, subject to casualties and vicissitudes beyond human control. Agriculture is becoming public property. How great the change! Hitherto hidden in secluded obscurity, it is now thrown open to the blaze of public examination or public censure. Editors of metropolitan papers now consider the production of our daily bread and employment of our daily labourers a matter of sufficient public interest. This is good. The force of public opinion in this free country always detects error and dictates amendment.

I am not one of those who love and praise the "good old times." It is a fallacious term. The people were never so well fed, clothed, or housed as in these good new times. The monopoly (a hateful term) of limited production in manufactures vanished at the appearance of steam power, which has stimulated and developed the taste and capability of our artisans, and has decked the humble occupants of our village churches with the

elegances and varieties of form and colour. That same mighty power has, by rapid intercommunication, confronted intelligence with ignorance and prejudice. The steam press will shed its brilliancy on agriculture, and the steam engine must compel, from the undisturbed bosom of mother Earth, an increase of her fertility. Our antiquated obstructive legalities in conveyancing will give way to public, secure, and immediate transfer. A thousand acres of land will change hands as quickly as 20,000*l.* consols. Why should it not? We shall then have squared estates, straight roads, central buildings, and a thousand profitable conveniences, in lieu of the ruinous monstrosities of ancient times and ancient primitive circumstances. This is the age of progression, legal, civil, social, artistic, and economical. Can, then, agriculture stand still and escape this general influence? Impossible!

The censure of our present state of agriculture is not the mere *ipse dixit* of poor Mr. Mechi. It is the truthful burden of the various county essays that receive the prizes of the Royal Agricultural Society of England, that excellent and useful Society, which finds it difficult to exact from numbers of its recreant members the paltry and promised annual pound pittance. So far as Mr. Mechi is personally concerned (and I am told to speak personally of that individual), I will say that his investments and improvements must ultimately pay, and promise now fairly to do so. I mean those effected on sound and incontrovertible principles, such as drainage, deep cultivation, open fields, substantial buildings, steam-power, &c. If any portion of his operations have been done extravagantly or improperly, such parts cannot be expected to answer. Those who are conversant with agricultural amendment, know full well that seven years are scarcely long enough fully to develope its results. My confidence in these results is firm and unshaken, and great is my mental gratification that the few superabundant means with which it has pleased God to bless me have been expended in affording food and employment to my able and willing fellow creatures.

I have noticed with pain, but not with surprise, the delight with which any supposed failure of mine is hailed by certain folks, whilst an old practical farmer who loses his money because he disbelieves in drainage, or perseveres in old and unprofitable practices, is most abundantly and sympathetically pitied and patted on the back. Now that my farm is in working order, the public may, at all times, form their own conclusions. To me it daily and happily developes the truthfulness of agricultural amendment. I have doubled the produce of grain, and quadrupled the quantity of meat. Let others who have the means do the same, and we shall arrive at the same results as in manufactures, viz., no importations, a cheaper article, and greatly increased consumption; for no man can deny that our rural and general population could consume three times as much animal food as they now get. Of course, with these diminished prices, we shall naturally and properly have proportionately cheaper rents, rates, tithes, and taxes, with a more vigorous, because better fed, peasantry.

So long as it pleases God to spare me I shall continue, in spite of all opposition, to stimulate agricultural amendment, and indulge in the, to me, most delightful task of admiring the divine wisdom and goodness, as exhibited in Nature's ever-varying beauties. *J. J. Mechi, Tiptree-hall, Kelvedon, Dec.* 27.

Home Correspondence.

The Fruits of Thin Seeding.—Having read a good deal recommending thin seeding, I was induced last year to try it upon a small scale. I therefore took a piece of land in the middle of one of my fields, the average piece of my farm, ploughed four times after winter Tares, and sown upon a state fallow; the result is as follows:—2 ridges 50 perches, sown broadcast with 9 quarterns, produced 9 bushels of Wheat; 2 ridges 52 perches, hoed in with 5 quarterns, produced 6 bushels 1½ peck of ditto; 2 ridges 48 perches sown broadcast with 6 quarterns, produced 8 bushels of ditto. Where the Wheat was sown thinnest the wireworm eat it most, and made the Wheat very thin also; the quality and quantity of the straw was not so good, and the quality of the Wheat not so good by 2*s.* per sack, besides filling the land with a quantity of weeds. Had it been sown after Clover, with one ploughing, I think the difference would have been more in favour of the thick seeding. *G. R. Hulbert, Ford Farm, Bradford, Wilts.*

High Farming and Low Prices.—In compliance with the suggestions of your caustic correspondent "P.," I willingly supply further detail of the "inexplicable mismanagement" of the 41 acres of arable land, not in Wheat, and of the 35 acres of Grass land, and also of the consumption of the produce of the same. 15 acres of the arable land was cropped in Beans, 10 acres in Clover, 2 acres in Turnip fallow, and 14 acres in bare summer fallow. The Clover and about 10 acres of the Grass land was mowed, and the produce of the arable and Grass land, except the Beans sold and credited in the account, was consumed on the farm, by 4 farm horses, 5 colts, 35 ewes and their lambs, and 28 pigs, besides 6 oxen wintered on Turnips, chaff, and linseed and hay, and which, when sold out in the spring, barely paid the cost of the linseed consumed; the oxen therefore, with the linseed, are excluded from the account. "P." is unjust towards the farmer, in stating they require a compulsory tribute from the rest of the community. They will gladly adopt any course of cultivation to make both ends meet, and no class in the country more heartily embrace the good old motto "live and let live." But one can hardly see that profitable cultivation is so easy of attainment at the present prices, and the existing outgoings in the shape of rent, labour, and rates; even the intelligent and indefatigable Mr. Mechi declares that last year he lost money. He hopes for better things this year, and who does not so hope? My Lord Kinnaird estimates the produce of the district in Scotland in which his estates lie, in the present year, at upwards of 60 bushels per acre of Wheat; and should we not gladly accept his lordship's estimate as an indication of the produce of the country at large? But "hope deferred maketh the heart sick." There are, I am sure, but few farmers who will not meet the present prices as far as they can, by increased production; indeed, it is the urgent duty of all to do so. But the farmers have been compelled also, as other classes in the country dependent upon them know to their cost, to curtail greatly their own personal and housekeeping expenditure, which cannot fail to depress the general trade of the country. To revert to my farm; while I cheerfully submit to any criticism in which "P." may indulge, I should prefer practical suggestions from experienced men; and I hope if any of your correspondents can point out a more profitable course of management than the one I propose to pursue, they will kindly do so. I have good farm buildings and yards, the buildings are spouted, and the yards have a tank to take the surplus urine which the manure will not absorb; and in order to enrich the manure heap, I propose to consume in the yards all the produce of the farm except the Wheat. Nearly all the arable, and the greater part of the Grass land, is furrow drained, with pipes 30 inches deep. I have succeeded this year in putting in 30 acres of Wheat, and I hope next year to adopt the following course of cropping of the arable land. One-half Wheat, one-sixth fallow, with Swedes and Mangold Wurzel on such part as can be cleaned without a summer fallow, one-sixth Clover, and one-sixth Beans. In conclusion, allow me to say a word in favour of burnt soil, and to recommend it strongly to all clay farmers as a manure for Turnips, or a dressing of a summer fallow for Wheat; its good effects are most striking. I have used it for several years, and the present season have applied upwards of 800 yards in the manner described, at the rate of about 60 yards per acre. *R. F. W.*

Farm Estimates.—I peruse your Paper with some attention and much interest, but must acknowledge that I am much perplexed, not knowing what to think of the many complaints made by farmers that not only they are not gaining anything, which I could readily believe, but that they are going headlong to ruin. In your Paper of 10th November, an account was given of the expenses attending the cultivation of an acre on the 4-course system, showing a profit of 28*s.* 6*d.* per acre. This account I have not seen controverted yet, and others, as well as myself, have expressed a wish that the calculations should either be admitted to be correct, or proved to be wrong. It is also much to be regretted that no one has yet given an exact debit and credit account of a farm, leaving out all that may appertain to the maintenance of the farmer and his family, or giving the farm credit for all that is taken for family use; combining the two together cannot show the exact state of accounts in so far as the actual produce of the land is concerned, inasmuch as a person may spend too much, and lay it all to the account of farming being unprofitable. Advocate as much as you can the bringing forward of such accounts from various parts of the country; it would enlighten the public, and might at same time show, by comparisons, where economy might be practised. In your *Gazette* of Nov. 24, "Amicus Tull" gives an account of his proceedings in a small farm of 56½ acres, and states the profits at about 105*l.* "Omicron," in your *Gazette* of Dec. 15, reduces this to 29*l.* 10*s.* But how does he do this? He begins by putting the profit on pigs, fed off the Barley of "Amicus Tull," at *nil*; he allows him nothing for his Barley, so that in fact he blots out altogether the produce of 5 acres. Is that fair? He deducts the keep of the horse, under plea that a man must have a horse to go over his farm, forgetting that it does not take very long to go over a farm of 56 acres. He reduces also the produce of the 8¾ acres of Wheat to 4 quarters per acre, not taking into consideration that, if "Amicus Tull" has raised his produce to 5 quarters, he has debited himself with 37*l.* 10*s.* of extra manure; that is, to nearly half of the amount put down for the produce of the Wheat; besides he gives you the result of his four years, which appear to bear out his prospective account. Everything considered, I am of opinion that his statement is fair, and that the objections made thereto are not well founded; indeed, as far as the pigs are concerned, it is really but too apparent that the critic had not weighed all things well; if he would not allow him his pigs, allow him his Barley at least; to deprive him of both by a stroke of his pen is not at all charitable. I make these few observations to be used by you as you think proper; farmers ought to be rather encouraged than discouraged, they have much to contend against, but nothing that they cannot overcome, provided they are properly met by landlords, with a fair reduction of rents, not allowed at rent days, as of alms-giving; with the removal of sundry objectionable conditions in the leases; and with the abrogation of the Game laws. *One who wants to come at the Truth.*

Price of Meat.—A butcher, in large business, in Hertfordshire, declares that he never made so much money "since he wore a blue apron," as he has done in the last six months, his profits having been upwards of 45 per cent. The explanation of his being able to do this is, that notwithstanding all that has been said, the supply of meat has not been excessive, and that, as there has been no excess that has been considerable, even if there has been any excess, he has been able to sell on his own terms, while the farmers have sold to him under the influence of a panic. *T. F.*

Thin Seeding.—Early in September last, I forwarded you a report of an experiment made upon different quantities of Wheat to the acre, to test how far thin seeding might be carried out successfully; and as, upon former occasions, Mr. Wilkins had endeavoured to cast suspicion upon my statements, and in several instances had denied them *in toto*, I resolved not to interfere in the threshing out the respective portions, but entrusted them to my clerk and assistant, Mr. Johnston, and a person named Poole, and his two sons, to thresh and make up the quantities, without knowing the object sought to be ascertained, further than to test them simply as an experiment. From some cause or other you deferred inserting this article, until the 24th of last month; and as I had hoped, forgotten or declined it altogether, as I had, from the obnoxious personalities resorted to by the rev. gentleman, resolved never again to enter into public correspondence with him, and had in a letter to his friend Dr. Newington expressed such intention. But I cannot allow his last letter to pass without a parting observation; first that I did not misrepresent the quantity stated by him, as being 35,000 grains from a single grain, but I might have expressed a doubt as to 35,000 grains having been produced, and which doubt I still entertain. That as Mr. Wilkins never had, at the time I forwarded my communication, informed the public that the sort of Wheat he had cultivated was the Egyptian or many-spiked Wheat, which has always been held as exceedingly productive, but unfit for mealing purposes, I took the liberty of merely stating that fact, that the agricultural public might attach to it the importance that it deserved; this has roused the reverend gentleman's ire to such an extent that he has fallen upon me pell-mell, by endeavouring to bear me down with personalities (of which I regret he is more guilty than any other person I have ever come in contact with). Before I conclude, I beg to be excused observing that the remarks upon Mr. Thedam's experiments are upon a level with those made upon my own; as I happen to be acquainted with the nature of the soil on his farm, I am enabled to state that it is light silicious Turnip soil, and absorbent, and therefore would not be affected by moisture beyond the average lands of the district. And as regards Mr. Mechi's land, although it might in some instances be unequally seeded, as stated by Mr. Wilkins, notwithstanding which the majority that I examined was drilled exceedingly well, and regularly deposited. But it happened that exactly as Mr. Thedam increased the quantity of grains in each hole up to five, that the produce was greatest. And Mr. Mechi having adopted the same opinion as myself, that six pecks per acre on well cultivated land in Essex was the proper quantity, has drawn forth the stringent observations of the rev. gentleman, to whom I now respectfully bid adieu. *Robert Baker, Writtle.*

What do a Ton of Roots cost?—As high farming is the best system, and the most honourable, to enable the British farmer to meet the present low prices of agricultural produce; as there cannot be so much obtained for it, there must be more made of it; and as this cannot be done so profitably without the root crop—then it is surely the duty of every lover of his country to throw as much light as he possibly can on one of the most important branches of farming.

COST OF TURNIP CULTURE.

Per acre—	£	s.	d.
One deep winter ploughing	0	9	0
Ditto subsoil ploughing	0	16	0
Two spring ploughings	0	12	0
Three double harrowings	0	3	0
One scarifying	0	2	0
Two rollings	0	1	0
For gathering Couch	0	2	6
Ridging and dung covering	0	3	6
Dung, 25 tons, at 3*s.* per ton	3	15	0
For carting and labour	0	12	0
Three horse-hoeings	0	4	0
	£7	0	0

As this system of cultivation will so much improve the condition of the soil, one-fourth must be taken—1*l.* 15*s.*

	£	s.	d.
One-fourth of cultivation	1	15	0
For artificial manure	1	0	0
For seeds	0	3	0
Sowing	0	1	0
Thinning	0	5	0
Hoeing	0	3	0
Pulling and cleaning	0	8	0
Carting and camping	0	10	6
Rent, rates, tithes, and taxes	2	10	0
Interest on capital	0	9	6
	£7	5	0

Taking an average crop of roots at 25 tons per acre, and as the tops are worth for manure 1*l.*, and quite as much when given to cattle, they will cost 6*l.* 5*s.* per acre, or 5*s.* per ton, clean roots. Now, what is a ton of roots *worth*? This is one of the most important questions to the British farmer at the present time; but to manufacture them into beef, and to make it profitable, will depend on the skill and judgment of the farmer, and how it is carried out. I will give you an experiment of three animals, and what they consumed during their 18 weeks of feeding. Two short-horned

heifers, three years old, bred on the farm, value 26*l.* when put into the boxes.

	Daily—lbs.	Weeks.	Tons.	cwt.	lbs.		£	s.	d.
Roots	180	18	10	2	56,	at 10*s.* per ton	5	1	3
Hay	10	Do.	0	11	28,	at 3*l.* per ton	1	13	9
Straw	20	Do.	1	2	56,	at 1*l.* 10*s.* p. ton	1	13	9
Litter straw	36	Do.	2	0	56,	at 1*l.* per ton	2	0	6
Pea-meal, 4 lbs. increasing to	8	Do.	0	7	0,	at 7*s.* per cwt.	2	9	0
Barley-meal	2	12	0	1	56,	at 7*s.* per cwt.	0	10	6
Linseed-meal	2	12	0	1	56,	at 12*s.* per cwt.	0	18	0
Oilcake	10	6	0	3	84,	at 10*s.* per cwt.	1	17	6
Coals and attendance							1	16	0
Value of the two heifers							26	0	0
Interest on capital, at 10 per cent.							0	18	0
							£44	18	3
Taking the manure to be the value of straw consumed							3	14	3
							£41	4	0

They were sold for 41*l.* 10*s*, leaving a balance of 6*s.* after payment of 10*s.* per ton for roots. A cow, eight years old, bought for 10*l.* 10*s.*, of a cross breed, fed in stall and box.

	Daily—lbs.	Weeks.	Tons.	cwt.	lbs.		£	s.	d.
Roots	160	18	9	0	0,	at 10*s.* per ton.	4	10	0
Hay	8	Do.	0	9	0,	at 3*l.* per ton	1	7	0

Loss on this cow							£4	12	3

The hay and straw being cut into chaff and mixed with the Pea-meal and steamed; the Linseed and Barley-meal being steeped 26 hours and mixed with chaff. The period of year, Jan. 15th to May 21st, 1849. *William Aitchison, Counden, Warwickshire.*

Balance Sheet. — I believe your correspondent "H. H. H. R." to be correct in his observations respecting his balance sheet. I was thunderstruck when I calculated what an acre of Wheat cost, and I believe half the tenants in Somersetshire must go to Australia; but he has left out two items—manure and the tenant's property tax, 3½*d.* in the pound. The latter ought not to be upon the land, but upon his profits of the year, the same as in trade—the average of three years I believe. P.S It was from the 1st of January, 1849, to the 1st of May, we graziers lost upon our stock; selling out in May, after consuming all our hay, Mangold Wurzel, Swedes, &c., for the same only as they were worth the 1st of January. Keep for four months upon 37 beasts a loss of 5*l.* a head = 185*l.* loss; while the butcher, miller, and baker are making their fortunes. *Sub.*

Landlord and Tenant.—Our landlords must drain our lands ere we can grow 40 bushels, or even 30, charging us a 5 per cent. interest; and these times throw us back a something towards extra burning, cleaning, &c., our land; we will then try what "H. H. H. R." says, try and grow 40 bushels. See the difference of price in Wheat at 5*s.* per bushel and 7*s.*; this is 2*s.* per bushel on 40 bushels, exactly 4*l.* per acre. How are we to live and be honest? Rely on it Wheat cannot be grown in this country for 5*s.* per bushel. *Sub.*

Farmers' Clubs.

LEIGHTON BUZZARD AGRICULTURAL ASSOCIATION, *Sept.* 28.—At this meeting, Mr. CALVERT made the following remarks on the Smithfield nuisance. He said—

Last session of Parliament a committee sat for the purpose of considering the subject, and notwithstanding the astounding facts brought forward, not a single petition was presented to the House. It was shown that while agricultural produce to the value of seven millions sterling changed hands in that market, the loss by the present system to farmers who sent their cattle there was not less than 400,000*l*, or 5 per cent. He would appeal to graziers to think about that fact. He had read the evidence with the greatest attention; and it was clearly proved that a loss was sustained in driving every beast backwards and forwards to Smithfield, and he would earnestly conjure the meeting to petition Parliament and enlighten their members on the subject. If not, the salesmen would continue to have the benefit, and the graziers be for ever precluded from disposing themselves of their own stock, as they could do in every other market in the kingdom. There ought to be a large market for London, with ample lairs, conveniently situated for driving the animals thither without loss, and the immense confusion witnessed in the streets, and definite times should be fixed upon for taking stock into the market, and above all that awful scene of Sabbath desecration, which so much disgraced the neighbourhood of Smithfield, should be done away with for ever. It had been said that farmers need not look to a protection. He thought this was a true doctrine; but there was one point which they might attend to likely to add considerably to their profits. Suppose that, with a new market, the clear gain upon each head of cattle was 1*l.*, then to those graziers who exhibited in 12 months 100 beasts, here would be a clear gain of 100*l.* to their annual income. (Hear, hear). The market was held on Monday, and the beasts had to be sent up on Saturday. About 11 o'clock on Sunday the business of the salesmen began, who then went to examine them; and about 9 o'clock in the evening, the driving, shouting, and roaring began; and salesmen were thus compelled to desecrate the sanctity of the day—compelled by legislative enactment, and in a day, too, when so much was said about the legislature interfering to prevent such occurrences, so repugnant to the right-minded feelings of the people of this Christian country.

FYLDE.—The Chairman proposed "The Liberty of the Press."—Mr. JOHN LIVESEY thanked the company for the compliment they had been pleased to confer. He was sure they could not too highly appreciate the freedom of the press in England. Leaving that subject, he would express a degree of admiration at the exhibition they had witnessed that day. In another part of the county a monster exhibition had been held, in which, he maintained, most humbly but firmly, that there could not be an equal competition between the persons who took their stock; whilst in this society every one was placed upon a level, and there was that kind of freedom which, he contended, was a most healthy and salutary stimulant to the improvement of agriculture. The competition elsewhere was most unequal; it was that of a Goliah against a pigmy. It was the competition of men of abundant, he might say superabundant capital—men who need not consult their means nor their capacity in the promotion, not of their agricultural ideas, but of their agricultural fancies—it was the competition of such men with those who had to consider not only their fancies, but their very subsistence and existence. (Loud cries of "Hear.") He said, therefore, that an exhibition such as that they had that day witnessed, was one which claimed their special approbation, and one which tended more to encourage a hope of improvement of agriculture than any witnessed elsewhere. This reminded him of an anecdote, which, very possibly, most of those present had heard, but which was extremely *apropos* at the present moment. The lady of a Yorkshire baronet, who had little to employ her time, as was the case with most ladies at the present day—would that they had something more to do!—(laughter)—the baronet's lady was in this particular position, and took a fancy to the pursuit of agriculture. She had a wish to turn her attention to farming, and therefore she solicited from her husband the privilege of managing a small farm, which he readily granted. He considered that her waste time could not be better occupied than in some industrious pursuit, and determined that she should have every facility to pursue her notion. She kept this farm for a time; the end of 12 months came round, and she began to take stock. She then appeared before her husband with a considerable balance in her favour, and said, "I have had a very pleasant time of it, and find agriculture a most lucrative business. I have sold this, that, and the other, and have so much in hand; and I really am at a loss to understand why the farmers should complain." "My dear," said the husband, "have you got the rent ready?" The lady was taken aback immediately; that simple question had never entered her mind. (Laughter.) She had farmed without rent, and had, therefore, made a profit. This, however, was a kind of oversight very few landlords would permit their tenantry to be guilty of. (Cheers.) It was therefore important for the tenant to remember that he must farm, not according to mere fancy and for superficial competition, but, as one of the inspectors had remarked, according to that which was useful and profitable. It would be extremely out of place in him to enter upon anything like agricultural topics. There was an old proverb, "Every man to his trade." And he should find himself as much out of place amongst agricultural technicalities as the gentlemen present would, if put into a printing office and requested to "set up" a few types, or to read a few proofs. But there were at the same time a few leading principles connected with every business or trade, of which those not engaged therein might be allowed to take cognisance. Their duty was to avail themselves of circumstances placed at their disposal; and if the removal of protection had been an injurious act to the farmer, he who was shipwrecked could do nothing better than collect the materials left him, and construct a raft for his own safety. If the removal of protection had left them in a state of jeopardy and danger, he called upon them to act with energy and hopefulness, instead of exhibiting despondency and lethargy. The interest of agriculture was one which must be of a permanent character. The prosperity of manufactures and of all works not absolutely essential to the existence of the human family, was often fluctuating and hazardous; but that which was necessary for the support of life must always be enduring and permanent. There could be no cessation in the demand for agricultural produce; they would always have a demand sufficiently great for them to supply. That being granted, there was only one course left for the farmer—and that was for him to avail himself of every means Providence put in his hands to work out his own salvation; and in a critical period like the present that could only be done by bringing to bear the utmost amount of energy and of intelligence. Various suggestions had been thrown out with respect to the mode of effecting a retrenchment of expenditure. He would remind them there was one course which they could not and ought not to adopt—and that was, to make a reduction in the price paid to labour. He trusted the agriculturists of this country would never be under the necessity of cutting down the remuneration of their labourers; inasmuch as he thought that in a well-paid, well-fed, and contented body of labourers consisted in a great measure the substantial prosperity of agriculture. In proof of this, they had only to contrast this country with a neighbouring and unfortunate country, Ireland. (Hear, hear.) The farmers of England must now see the necessity of applying increased capital to the cultivation of the land. In comparison with the magnitude of our trade and commerce, the amount invested in agriculture was totally incompatible and insufficient. He maintained that there was a totally inadequate application of capital in this country to agriculture. But that increased application of capital, that untiring energy, that necessary intelligence could never be expected to be employed under the present conditions on which land was let—conditions which were exacted for the benefit of a few to the inconvenience and hindrance of many. (Hear, hear.) He contended that we must witness a number of legislative changes before this new system of management could be carried out. Amongst these changes the most important was the absolute necessity of giving to the farmer some security for the return of capital which he might advance in the improvement of the soil. That, he felt conscious, must be one of the first measures passed by the Legislature. And next to that must be the introduction of an extensive plan of leasing. He could name many instances in this part of the country, if called upon to do so, where individuals taking farms, in order to improve those farms and attain something like comfort and prosperity to themselves, and to achieve a reputation for intelligence, energy, and enterprise, had been induced to apply capital most unsparingly; and their reward had been, not the return of that bread which they cast upon the waters, but an increase of rent, subject to the disagreeable alternative of ejection. This was a fact, and nothing could prevent the recurrence of such facts—and disgraceful facts they were, because property had its duties as well as its rights—nothing could prevent the recurrence of these proceedings but the security of leases. (Cheers.) And there was another point—not only was the granting of leases necessary, but they must be proper leases. He had occasionally inspected leases that were worth nothing at all to the tenant. It was not only the multiplication of leases that was required, but their simplification. He believed that, generally speaking, the leases granted now were much too complicated, much too replete with restrictions to be of any substantial benefit to the farmer. He thought, therefore, that a wholesome improvement might take place in the simplification of leases. After briefly adverting to the absolute importance of a reduction in the cost of the conveyance of land, Mr. Livesey went on to say that there was another subject he had occasionally seen noticed at agricultural meetings which should be fearlessly adverted to—namely, the present strict and rigid maintenance of the Game-laws. He thought the sooner those laws were repealed, or subjected to great modification, the better it would be for agriculture. He mentioned these subjects because he knew there was often a delicacy on the part of the farmers to refer to them. He maintained that for these meetings to attain their proper purpose, every subject connected with agriculture ought to be fully and freely discussed. The subjects he had named—security to farmers for capital expended in the permanent improvement of their farms, the multiplication and simplification of leases, the cheapening the cost of the conveyance of land, and the repeal or great modification of the Game-laws—these were subjects which most deeply affected the farming interest. The present customs might be compatible with an era now passed away; but with an era of severe and universal competition, such customs as those to which he had adverted could not be maintained; or so long as they were maintained they would be detrimental to the interests of farmers. And so long as farmers were silent upon these matters they would be enemies to their own interests. *Preston Chronicle.*

Review.

Experimental Agriculture, being the Results of Past and Suggestions for Future Experiments in Scientific and Practical Agriculture. By James F. W. Johnston, F.R.SS.L. and E., &c. Wm. Blackwood and Sons, Edinburgh and London.

A WELL conducted experiment implies intelligent design. It is the test of a probability. We cannot *know* what has not hitherto been determined; but the connection amongst observed facts is so constant that, once ascertained, it may be considered permanent; and that which we do know thus enables us very often to anticipate conclusions regarding what is still unknown. A certain amount of acquaintance with the subject of research is thus necessary to any one who would successfully conduct an experimental inquiry respecting it. He must be able to imagine plausibly in the first place, and then he must be able skilfully to devise and impartially to execute some plan for testing the accuracy of his idea. For this reason nothing could be more useful than a work which first communicates the kind of knowledge required by an agricultural experimenter, and then details a great mass of research as models for his further proceedings.

Such is the character of the work before us. Professor Johnston is in the position for which we imagine him to be best suited when philosophising upon those facts which a multitude of labourers have gathered, and are continually adding to the stores of scientific agriculture. No one has more skilfully arranged the results of our practical men, whether of the field or the laboratory; nor is there any one with a higher reputation as a teacher of those truths which, in his hands, they are made to exhibit. He has done no inconsiderable service himself as a personal labourer on the boundary line between agriculture and the sciences; but it is to those works in which he has collated the labours of others that the defenders of his reputation will chiefly refer.

We must add one word by way of criticism. The title of the book before us leads to the expectation of more than it contains. "Experiments in Scientific and Practical Agriculture" should include many subjects beside that of manures, which is the only one that is discussed. Certainly it is discussed very fully; but the important topics of the mechanical condition of the soil, the improvement of plants, the feeding and breeding of animals, are quite as deserving of place in a work professing to treat of "Experimental Agriculture."

Calendar of Operations.

DECEMBER.

BEDFORDSHIRE FARM, *Dec.* 31.—The weather of the current month has been of a truly wintry character, and has in a great measure ruled every out-door operation of the farm. When fine and open the plough has been kept steadily at work, in following up the sheep on Turnips, and in turning over the remainder of the stubble for spring Beans and green crops, the greater part of which have been well manured. When frosty, the teams have been engaged carting dung, and liquid and other manures, threshing by machine, carting Turnips and litter for cattle, &c. We go with one-horse carts in all ordinary cases. There is but one waggon on the ground, and that gets an airing but seldom. The labourers will be engaged in threshing and dressing corn, storing Turnips, turning composts, lopping Willows and hedges, &c., in addition to the usual labour in connection with horses and stock. The great bulk of the Turnips are cut, for both cattle and sheep, and also the hay, and Pea and Oat straw. The fatting stock are kept upon Turnips, meal, and chiefly hay chaff. The store cattle and sheep receive Pea and Oat straw, with a proportion of Turnips. The stores intended for next year's fatting off receive a portion of Linseed or other artificial food, to keep them in a progressive state. The young stock of from 6 to 12 months old have also a small allowance of Linseed jelly. We seldom consume any Mangold Wurzels till February or March, when they seem more suitable for stock than when given in the autumn; they also take the place of Turnips, and permit the free working of the land for Barley, which has always succeeded best with us when sown early. Barley sown last year in February has turned out better, both in yield and quality, than any sown later. The early sown Barley weighs 57 lbs., full weight, per bushel; some of the late but 53 lbs. per bushel. The price of meat has for some time ruled very low, but still it is higher in proportion to the price of feed corn, whether of home or foreign growth, than in the time of high prices. It is self-evident that there is more profit in fatting stock now with Barley at 26*s.*, Oats 18*s.*, and Linseed at 36*s.* per quarter, the product realising from 3*s.* 4*d.* to 4*s.* per 8 lbs., than when corn sold at double its present price, and meat made but about a fourth more. Those, therefore, who have poor land to improve can do so now at a much less cost than formerly, with, we think, a small present profit. On the other hand those who expended large sums in the purchase of corn in the times of high prices, or consumed their own produce for the benefit of the land, not only lost then, but cannot be repaid now, even with increased produce, with such low prices. The character of the past year will long be remembered as one of the most serious that ever happened in its effects on the interests of the British farmer. We hope, however, that the worst is past, and that the "good time coming" may have been preparing for us, and is just at hand. *R. V.*

DORSET FARM, *Dec.* 31.—Almost all are now employed alike in providing food for cattle, carrying dung, and other kinds of top dressings that have been provided for the land. But, although there may be little work directly pressing, with the exception of stock feeding, yet exertion ought to be made to get the ploughing forward for spring corn, and also for the Turnip crop, for the earlier ploughing is done the more it will be pulverised by the frosts, and will hold the seed more equally. And instead of leaving our dung in the yards, and having to turn it

in the spring before applying it for the root crop, it is better to take every opportunity of carting it out to the fields where it is to be used, so that there may be as little hindrance as possible to get it spread out when the busy season of putting in the crops arrives; and instead of putting it up loosely in a heap on the field, we prefer driving the carts over it, to tread it firmly down, which prevents its rotting so much; the less it is rotted the less is it wasted. We have been employed getting out a supply for our Mangold Wurzel crop; and also getting some pond mud put on the pasture lands. This is done when the weather is too frosty to allow of ploughing. We have still a little spring Wheat to sow after Turnips, which we shall most likely finish in the course of a month. Our ewes have now begun lambing, and so far as they have gone have done very well. We have only had four slipped lambs of the 500 we are breeding from. We keep them in different lots, according to their degree of forwardness, in a large well sheltered yard, to which a covered shed is attached, into which we put the newly lambed ones, and feed them with hay, Cabbages, and Mangold Wurzel; the latter are stored in a house close by the shed. In looking back upon the year that is almost closed, we must say that there have been few seasons more favourable to the various operations of farming, and whatever the profits of farming may have been, it is certain that "mother earth" has done us all justice by giving us abundant crops of every sort. *G. S.*

Fen Farm, *Dec.* 28.—The attention of farmers in December and January is absorbed in the treatment of live stock, the preservation of manure, and the management of drains. The treatment of live stock involves the treatment of Turnips, respecting which a diversity of opinion and practice prevails. To take Swedes up in November becomes a more frequent plan, and if the land is at all cold and heavy, cart them at once to the yard or home-close, near the steading, in long heaps 3 yards wide, and lightly thatched with stubble. On lighter soils the pies are smaller, and distributed over the field to be cut for folded sheep, or partly taken to the stalls as wanted. Still it is the custom in many places to eat the Turnips without packing them until more than half consumed, particularly where breeding ewes are put on them, in which case the land seldom receives sufficient tillage and the Barley is got in late. Ewes are said to do better on dry Grass land, supplied moderately with cut Turnips and hay or chaff; others, again, advocate the reservation of a piece of white Turnips (at the risk of half of them being destroyed by frost) for ewes after lambing, arguing that they cool the sheep and increase the milk so as greatly to benefit the lambs. White Turnips, as I observed last season, ought not to be seen after Christmas; but I have been assured by men of great experience that they are of great value for early winter keep. I must think the hybrids and Swedes worth far more; but when the sowing season is unfavourable, or unforeseen interruptions occur, the white Turnip is a capital resource to fall back upon. Turnips are attempted sometimes on a small scale on fen land, and they will look tolerably well, but they will not fatten stock; they are very subject to grubs or larvæ, and they distress the land. Not so with Carrots or Coleseed, always providing suitable manure precedes them. As in the case of properly managed Carrots the land is thoroughly cleaned and stirred to a considerable depth, a good crop of Coleseed offers a dense cover and carries a great many sheep. A great weight of Mangold Wurzel is generally obtained; but if the soil is light and turfy, it is exhausting and the produce washy; still it is very useful to fill up gaps anywhere, and is eagerly consumed by all kinds of stock. We have paid for cleaning Turnips 7*s.* per acre. The beasts offered in Peterborough market have improved in quality during the past month, and higher prices have been made; the supply may be expected to increase, and if 7*s.* per stone of 14 lbs. continues to be realised with the very moderate price of Linseed cake, they will remunerate the grazier who did not buy too early. We hear of a great variety of compounds being given with the cookery of the new school. As experiments carefully noted they would deserve all commendation. As if to exhibit a worthy object for all breeders to aim at, the very excellent animal shown at Smithfield by Mr. Jones got fat in a small paddock without any trouble, and with scarcely any expense; the blood relations of such a bullock should be taken care of, and if this easy "aptitude to fatten" should prove to be a family feature, he might furnish an array of facts against the enemies of fat, and so save much food and stop a deal of claptrap periodically thrown at the comparative amount of prizes offered for good stock and to deserving labourers. I have already exceeded my limits in beginning one of the subjects now claiming the attention of farmers. *J. W., Peterborough.*

Sussex Farm, *Dec.* 31.—Our teams are for the most part engaged in carting dung from the cattle yards to the fields, for the next year's green crops. We put the dung in large square heaps, and cover the heap over with earth. We dig a hole at one end of the heap, to catch the liquid manure, which is frequently thrown over the heap. We are also carting dung on to the Hop gardens when the ground is hard enough to carry the carts, and as soon as the weather becomes open we shall commence to dig the ground, and the teams will return to ploughing. Our labourers are for the most part engaged in threshing Oats, Peas, and Beans, filling dung, planting and repairing hedges, ditching, draining, &c. Our stock ewes are at present 309 in number. We carry on to the Grass land two loads of Turnips daily for them; they are brought into the yard at nights, and are fed with Pea-haulm or Oat-straw. As the winter advances we give them hay; they are much improved in size since we commenced to grow green crops, and are at present in excellent condition. We find the Cabbages very useful food at this time; they need no preparing, and are not injured by frost. We give our cows a feed of Cabbages or Turnips; the young stock and lambs also receive a feed of Cabbages daily. *J. B.*

Notices to Correspondents.

Barley: *A B.* You may apply guano over the young leaf, without harm to it, if it be done in wet weather. You may sow the Barley in 9-inch rows, and after it is up sow 16 lbs. of mixed Clover seeds broadcast, and hoe it in. A shallow hoeing will suffice. You had better in that case either sow the guano a fortnight before sowing the Clover seeds, or delay it till after the Clover is up.

Butter made by Compression of Air: *T F.* We never heard of such an idea. We have heard of butter made by agitation (as it is in other cases, but) by a stream of air passing through the cream; but the structure of cream does not make it at all likely that mere compression would have any effect upon it.

Courses of Cropping: *Subscriber.* The land is to be broken up. Half of it might be pared and burned, and sown with Turnip and other roots; and half of it ploughed up and sown part with Oats and part with Beans. Half the roots will be fed on the land by sheep, and half carried home, to be consumed in the barn by cattle, which will be littered with the straw from the grain crops. The following year the Turnip land will be Wheat, one-fourth of it being also sown with Clover seed, and the stubble may be divided into four parts—one planted with Beans, one with Mangold Wurzel, one with Swedes, and one, which on the following year will be Clover, may be sown with Carrots for the current year.

Discoloured Yolks: *Philanas.* We have heard of similar cases with ducks, in which the offensive appearance has passed away as the season has advanced; but the only two instances within our own experience have occurred with hens, both much out of health, a recovery of which brought the yolks (apparently the only part of the egg affected) right again. Ducks at this season require animal food, or kitchen-scraps, besides the vegetable diet of Barley-meal, corn, &c. They should also be drily and warmly housed at night. The yolks of eggs are unquestionably affected by poverty as well as by peculiarity of diet. Of the latter fact, the coming season will afford opportunities of making curious experiments, by mixing with the food of hens ingredients either calculated to colour the yolks of their eggs, as madder, or those which may be thought likely to communicate a recognisable flavour, as musk, or essential oils. Lung diseases, to which fowls are so liable, may be expected to derange the egg-organs, from their closeness to the seat of disorder. *D.*

Drumhead Cabbage: *Inquirer.* We had to transplant some late in July, as you had. Ours have "Cabbaged, but they are very small." You had better use your leaves, as it is very doubtful if they will Cabbage after winter.

Feeding Pigs: *Amicus Tull* promises shortly to send accounts of his cost of feeding them.

Glazed Iron for Roofing: *T F* says, Why should not sheets of thin iron be coarsely glazed, and sold even cheaper than asphalte roofing, for covering barns, stables, &c.? The weight need not be large, nor the cost great. As the expense of fixing would be more than slating, the price ought to be less than slating. Glazing materials, when purity of colour is not needed, are of most trifling cost. [Sheet iron for roofing is, as you are no doubt aware, sold in a corrugated form for strength's sake, and either painted or coated with zinc for protection from weather.]

Manure: *Christmas.* You will find, at p. 798, that the misprint which has misled you was corrected. Cold clay soils would be benefited by the manure being applied in an unfermented state; but it must be applied so long before the seed is sown, or before the crop begins to grow rapidly, as that it shall have rotted in the soil before that time. We turn our box manure once, besides the carting out to heaps.

Partial Journalism: *A Correspondent and Subscriber.* Will you advise how we can be otherwise than *partial?* Do you think that 16 columns of type weekly is sufficient, in which to discuss *all* truth? The thing is absurd. Well, we restrict ourselves to agricultural matters, and not having room even for all that reaches us on them, we conclude to abandon every topic which arises out of their relation to politics. Not that such topics are not highly important, not that it is not of the very highest moment that the Truth regarding them be ascertained and made known, but that the remainder, to which we confine ourselves, is amply sufficient to occupy us; and, we imagine, *usefully* occupy us, too.

Poultry: *Gallus.* Mr. Dixon's work appeared piecemeal, the greater part of it, originally in our columns. Another book which you may consult is "Farming for Ladies," which discusses poultry, rabbits, pigs, &c.

Smithfield Show: *Newport.* The stone referred to is the imperial stone of 14 lbs.

Succession of Crops: *A B.* You may, we think, do safely what you purpose about Barley and Clover seeds after Beans and Turnips; and take Wheat after Clover.

Swedish Turnips: *A B.* An ox of 40 stones will eat about 1 cwt. a day along with straw chaff. Ten sheep of 16 lbs. a quarter will eat about 2 cwt. a day in the fields; rather less in the house.

*** Communications reaching town after Wednesday cannot be answered the same week.

Markets.

COVENT GARDEN, Jan. 5.

The weather during the week has been milder than that of the preceding, and the supply of Vegetables has been rather more abundant. Fruit, to , is for the most part sufficient for the demand. Hothouse Grapes and Pine-apples are good for the season, Filberts and Walnuts are abundant, and Chestnuts plentiful. Oranges and Lemons are abundant, good table Pears are scarce. Amongst Vegetables, Turnips are good and plentiful; Carrots the same. Cauliflowers and Broccoli are sufficient for the demand. Potatoes have not altered since our last account. Lettuces and other salading are plentiful. No alteration in the price of Mushrooms. Some Asparagus and Seakale may be obtained. Cut Flowers consist of Heaths, Pelargoniums, Gardenias, Bignonia venusta, Chrysanthemums, Fuchsias, Primulas, Camellias, Cinerarias, and Roses.

FRUITS.

Pine-apples, per lb., 5*s* to 8*s*	Oranges, per 100, 5*s* to 12*s*
Grapes, hothouse, p. lb., 3*s* to 6*s*	Almonds, per peck, 6*s*
— Portugal, per lb., 9*d* to 1*s*	— sweet, per lb., 2*s* to 3*s*
Pears, per doz., 2*s* to 4*s*	Walnuts, p. 100, 1*s* 6*d* to 2*s*
— per half sieve, 8*s* to 12*s*	— p. bush., 16*s* to 24*s*
Apples, kitchen, p. bsh., 2*s* to 4*s*	Filberts, per 100 lbs., 60*s* to 65*s*
Lemons, per doz., 1*s* to 2*s*	Nuts, Bar., p. bush., 20*s* to 22*s*
— per 100, 6*s* to 12*s*	— Brazil, p. bsh., 12*s* to 16*s*

POTATOES.—Southwark, Dec. 31.

The Committee report that the arrivals last week from the Continent have been very extensive—nearly 3000 tons; so large a supply of foreign Potatoes tends much to depreciate the value of those coastwise, particularly Scotch Regents, which are very difficult to sell; prime York Regents still command a high figure. The present prices are as follows:—York Regents, 70*s.* to 110*s.* per ton; Wisbeach do., 60*s.* to 70*s.*; Scotch do., 60*s.* to 70*s.*; Scotch cups, 40*s.* to 60*s.*; French whites, 60*s.* to 65*s.*; Rhenish and Belgian do., 40*s.* to 60*s.*

SMITHFIELD, Monday, Dec. 31.

The number of Beasts, although not very great, is quite equal to the demand. Trade is dull, and it is difficult to make anything over 4*s.* of the choicest. The supply of Sheep is small, and there is consequently a small advance on all kinds; the trade is, notwithstanding, dull, and 4*s.* 6*d.* is only realised in a few instances for choicest Downs. Good Calves are scarce and a little dearer. From Holland and Germany we have 196 Beasts, and 200 Sheep; from Spain, 80 Beasts; from Scotland, 100; from Norfolk and Suffolk, 500; and about 1400 from Leicester, Lincoln, and Northampton.

Per st. of 8 lbs.	*s* *d*	*s* *d*	Per st. of 8 lbs.	*s* *d*	*s* *d*

			Calves	 3	4 — 4 4
			Pigs	 3	4 — 4 4

Beasts, 3089; Sheep and Lambs, 16,620; Calves, 69; Pigs, 135

Friday, Jan. 4.

Owing to the absence of foreign supply the number of Beasts is small; however, trade is slow at Monday's rates. The supply of Sheep is a fair average for the time of year; a reduction of about 2*d.* per 8 lbs. must be made to effect a clearance. The only foreign stock being Calves, the trade is heavy in this department; it is difficult to clear out at a reduction. From Holland and Germany there are 111 Calves; from Scotland, 220 Beasts; from Leicester, Northampton, and Lincoln, 100; and 122 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3 10 to 4	0	Best Long-wools	3 6 to 3	8

			Calves	 3	0 — 4 2
			Pigs	 3	0 — 4 4

Beasts, 808; Sheep and Lambs, 4610; Calves, 289; Pigs, 233.

HOPS.—Friday, Jan. 4.

Messrs. Pattenden and Smith report that the market remains in the same quiet state as for some time past.

MARK LANE.

Monday, Dec. 31.—The supply of English Wheat from the neighbouring counties this morning was small, and quickly disposed of at an advance of 2*s.* per qr. Foreign met but a limited inquiry at the prices of this day se'nnight, and the attendance at market was moderate.—Barley, Beans, and Oats, are unaltered in value, as are also white Peas, but Maple and Dun are each 1*s.* per qr. cheaper.—Floating cargoes of Indian Corn are inquired after at 28*s.* 6*d.* for Ibraila, and 29*s.* for Galatz.

Friday, Jan. 4.—The arrivals of all grain during the week have been unusually small, and having to-day but a thin attendance at market, little business was transacted in any article, and prices of all may be considered nominally the same as on Monday.—Indian Corn afloat is held at late prices, but the demand is languid; the same may be said of Flour. The weather has become mild.—During the week great firmness has characterised the Wheat trade, and an advance of 1*s.* to 2*s.* per qr. upon British has been very general in the various markets of the kingdom; in some instances an improvement of 1*s.* per qr. has been established upon foreign. Spring corn has been dull, and its value remains nominally unchanged.—By the last accounts from Memel and Konigsberg trade was quiet, and grain prices unaltered. In Dantzic the owners of old Wheat held for somewhat advanced rates. In Stettin, grain of all kinds was in good demand, and the eagerness of buyers caused prices to rule relatively higher than in the other Pommeranian ports.

Parcels of Stock, &c., received and offered for Sale by Auction on the above premises.

D. A. R. begs to state that all goods or stock sent to him for Sale by Auction must be delivered on to the premises prior to being advertised for sale.—Letters addressed to Mr. D. A. RAMSAY, Auctioneer, &c., Brompton Auction Ground, Fulham-road, Brompton, promptly attended to.

HOT-WATER PIPES AND TROUGH PIPES, with all the usual connexions.

J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, keeps a very large stock of Hot Water and Trough Pipes, with Elbows, Syphons, Tee Pieces, Collars, Flange Sockets, and Spigots, Throttle Valves, &c., of excellent quality, and at very low prices. Parties requiring the work to be done can have good workmen sent to any part of the kingdom, with everything requisite for the heating, &c., at a stated sum. Rain-water pipes, Sutters, Sash-weights, Railing Bars, Air Bricks, and numerous other castings are also kept at J. JONES'S, Iron Bridge Wharf, No. 6, Bankside, London.

AGRICULTURAL TRAINING SCHOOL, Established for General, Practical, and Scientific Education, Hoddesdon, Herts.

President for the Session.—The Right Honourable LORD DACRE.
Resident Head Master.—Mr. HASELWOOD.
Second Master.—Mr. LUPTON. *Third Master.*—Mr. COKAYNE.
French and German Master.—Mr. ROELANDS.

Lecturers.

Science and Practice of Agriculture	Mr. HASELWOOD.
Chemistry and Chemical Manipulation	Mr. WILDSMITH, S.M.C.C.
Cattle Physiology and Pathology	Mr. A. CHERRY, M.R.C.V.S.
Botany, Geology, and Natural History	Mr. HASELWOOD.
Practical Mechanics and Natural Philosophy	Mr. LUPTON.
Practical Surveying, Levelling, and Draining	Mr. HASELWOOD and Mr. LUPTON.

This Institution has been established on the largest scale of efficiency, and will be found complete in every department.

A Fund has also been established by several noblemen and gentleman advocates of combining "Science with Practice" to assist the Tenant Farmers to educate their sons at this School; particulars of which, with Prospectus, may be had of the Head Master, Hoddesdon, Herts, either personally or by letter.

TO NURSERYMEN AND OTHERS.—ELIGIBLE OPPORTUNITY.

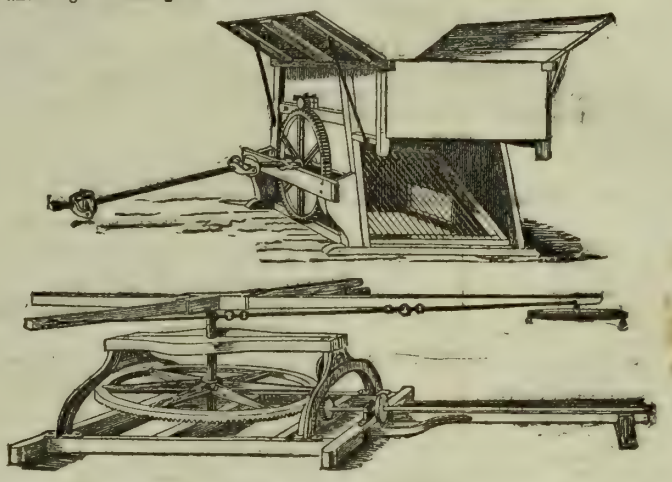
TO BE DISPOSED OF, an old-established and suitably stocked and planted NURSERY GROUND, of about 4½ acres, enclosed by substantial brick walls, nearly covered with bearing Fruit trees; a compact Cottage, Three Greenhouses, viz., a 67 feet lean-to, a 40 feet, and 30 feet span ditto, Propagating Stove, Range of Brick Pits, Frames, Lights, Hand-glasses, &c, all in good condition. An excellent supply of water. The business is in the locality of two populous towns, three villages, and various gentlemen's residences, within a short distance from a railway terminus, and nearly 20 miles from any similar establishment.—For particulars and to treat for the same apply to Mr. G. M. HINDS, Estate Agent, &c., 37, Queen-street, Ramsgate.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, January 21, 1850, at 2 o'clock precisely, about 1700 tons of damaged PERUVIAN GUANO, in Warehouse, ex sundry ships, by order of Messrs. Anthony Gibbs and Sons, the Importers.—Catalogues and further particulars in due time from Messrs. J. A. RUCKER and BANCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY, and Make the Animal look Better than when Paying 12s. and 14s. per Week.—Consider the enormous saving in these hard times—times of cheapness.—Apply personally or by letter at MARY WEDLAKE and Co's, 118, Fenchurch-street, Oat-bruising and Chaff-machine Manufactory, established upwards of 40 years.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.



CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

TO THE FARMERS OF ENGLAND.

MARY WEDLAKE AND CO.,

ENGINEERS AND MACHINE MAKERS TO THE HON. BOARD OF ORDNANCE, WOODS, WORKS, EASTERN COUNTIES, AND SOUTH-EASTERN AND BRIGHTON RAILWAYS, &c.

The Daughter of the late Mr. THOMAS WEDLAKE, begs sincerely to return her thanks to those friends of her late father, who for the last six years have so kindly bestowed their patronage on her Establishment, the *Original Implement Factory*, founded upwards of 40 years, at Hornchurch, known under the name of the Fairkytes Iron Works; and she begs also to remind gentlemen farmers generally, that in conformity with the wishes of her deceased parent, she continues to carry on the same business under the name of MARY WEDLAKE AND Co. Upon an inspection of their various Machines, gentlemen connected with Agriculture will find all kinds of Machinery recently much improved; and M. W. and Co., being determined to meet the times, and being in a position to do so, they have made considerable reduction in their prices. They beg to draw the attention of their friends to the new 4-horse Threshing Machine, which, if it does not surpass, at least is equal to steam power, without a tenth of the expense and danger attending it.

The above Machine will be found made of the very best materials and of first-rate workmanship, with self-oiling boxes, which prevent the brasses and other parts from giving way.

NUMEROUS REFERENCES CAN BE GIVEN.

"Weybridge Farm, Hornchurch, July 29, 1846.

"SIR,—In answer to your letter respecting the Threshing Machine I had from Mrs. WEDLAKE, I beg to say that I am perfectly satisfied with it. It does its work very clean, without injuring the straw, and it will thresh faster, and is easier for the horses, than any machine of this description that I have ever seen; for my part, I do not see that there are any improvements wanted. Yours respectfully, ANTHONY VINCE."

"To Mr. Bunn, Farmer, Herts."

Mr. BLEWITT says, "I threshed 20 sacks of Oats in one hour, 3 loads of Wheat-straw per hour, and upwards. We have threshed upwards of 2000 of all sorts of grain in 12 months, without a shilling of expense for repair."

Mr. J. LEE: "I never saw such a machine before. We cannot get sufficient hands to feed it."

Mr. P. BROWN: "We have done upwards of 60 quarters per day; straw uninjured; two quarters and a half of Rye in little more than an hour."

Mr. WASHBOURN: "In all the course of my experience as a farmer, I never saw a machine of such power, and so substantially constructed."

All letters to be addressed to MARY WEDLAKE and Co., in full, the Fairkytes Iron Works, 118, Fenchurch-street, City; or 5 Stand, Mark-lane. A list of the different articles made at the Works may be had on application.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of

THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

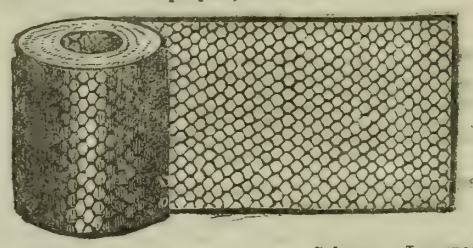
PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.



The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

TOOTHACHE PERMANENTLY CURED BY using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent. Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return of post, by J. WILLIS, 24, East Temple Chambers, Whitefriars, Fleet-street, London, in return for 13 penny stamps. CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy "Brande's Enamel" Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.

1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

Just published, with numerous plates, price 12s.,

THE FARM ENGINEER: a Treatise on Barn Machinery, particularly on the application of Steam and other Motive Powers to the Threshing Machine, and the extended application of Steam as a Motive Power at Farms.

By ROBERT RITCHIE, C.E., Edinburgh, A.J.C.E., F.R.S.A.S.

London: BLACKIE and SON, Warwick-square, and Glasgow and Edinburgh.

DIETETIC COCOA.

HOMŒOPATHIC PATIENTS, DYSPEPTICS, and Persons of Delicate Constitutions, are strongly recommended to use TAYLOR BROTHERS' DIETETIC COCOA, as being very superior to any preparation of the Cocoa Nut hitherto introduced. This article is manufactured on a peculiar principle, by which the oily portions of the nut are neutralised, at the same time its flavour, purity, and nutritious properties are maintained. It is an essential article of diet for those under Homœopathic Treatment, agrees with the most delicate digestive organs, is agreeable and soothing to the nervous system, and proves at the same time both invigorating and refreshing.

Sold wholesale by TAYLOR Brothers, at their Mills, Spital-fields, London, and retail, in 1 lb., ½ lb., and ¼ lb. tin-foil packets, at 1s. 4d. per lb., by most respectable Grocers and Tea-dealers in the kingdom; of whom also may be had TAYLOR Brothers' original SOLUBLE COCOA (only one-third the price of Coffee), the consumption of which article exceeds ONE MILLION POUNDS per annum—a fact which has induced many parties to manufacture spurious imitations, which, although somewhat resembling the appearance, are totally devoid of the essential and peculiar properties of the original and only genuine article. To guard against these counterfeits, TAYLOR Brothers recommend the purchase of their article in packets only which bear their name, with directions for use. Sold by all Grocers and Tea-dealers.

CHOICE VEGETABLES.

The following can be highly recommended as being very choice and valuable varieties, and will be FORWARDED FREE by Post, at 6d. per Packet, or Twenty Packets for 8s., with the exception of Cucumbers and Melons, which are 1s. per packet.

BRUSSELS SPROUTS—imported variety
BORECOLE—Cabbaging: new, very hardy; an excellent variety
BROCCOLI—Rendle's superb Willcove: a most valuable late variety, unequalled
Howden's superb Purple: a very valuable sort
Adam's new early White: a most superior early sort
Grange's early White: a very good Autumn Broccoli; succeeds the Cauliflower in October
Walcheren, true: superb autumn sort; one of the very best white Broccolis grown
Victoria, fine late White: a very superior sort
Chapple's early Cream: large superior variety for Autumn and early Spring
Elletson's Mammoth: a very large excellent late sort; the largest Broccoli in cultivation
BEET—Rendle's superb: a very superior dark variety of great merit
Cattell's dwarf blood Red: an excellent sort
White's Black: large and fine; can be highly recommended
CABBAGE—Rendle's early Admirable: a most valuable early sort
CABBAGE—Early Hope: a good early sort
Barnes's new early Dwarf
British Queen, Shilling's: very excellent variety
Sprotboro': very large and good
Matchless, Atkins's: superior variety; can be highly recommended
Enfield Market: very early and good
East Ham: one of the very best for general crop
Early Cornish: large, excellent sort
Early Paignton: very large
Warner's Incomparable: very early and excellent
CARROT—Improved Altringham: superior to the older variety
James' Green Top; large and very sweet
CAULIFLOWER—Large late Asiatic: very fine and large; an excellent sort
Walcheren (true), a most excellent and valuable variety; produces close compact heads; can be highly recommended
CELERY—Seymour's Superb White: very solid, large size, and excellent flavour; well adapted for early crop
Giant White (Law's): solid, enormous size
CELERY—Superb Red (Jones): very solid, and large, exquisite flavour
COUVE TRONCHUDA—This is a delicious vegetable, much more tender and finer flavoured than the Cabbage
CUCUMBER—Cheltenham Surprise: frame, very prolific, and from 18in. to 20in length; can be recommended as one of the finest known
Sion House: an acknowledged favourite for general crop
Cuthill's Black Spine: a very handsome fruit, a good general cropper
Southgate: grown for the London Market; of medium size, but great bearer
Stockwood Long Ridge: good variety for open air
LEEK—London Flag: fine, broad-leaved, best variety
LETTUCE—Ady's Cos: large and fine
Monstrous Cos: largest of all, and not apt to run to seed
Victoria Cabbage: s splendid cabbage Lettuce
Drumhead or Malta: an excellent summer sort, large and fine
MELON—Duncan's Green Fleshed: fine flavoured, excellent variety
Beechwood (true): a very beautiful netted fruit, of first-rate excellence
Cabul Green-fleshed: fine flavoured
Windsor Prize: very excellent sort
ONION—White Spanish or Portugal: best for general crop
Brown Portugal: resembles the above except in colour; good for general crop
James's Long Keeping: a very good variety, keeps sound longer than any other
PARSLEY—Rendle's Treble Garnishing
Myatt's Extra Fine Double Curled: a beautiful sort for garnishing
PARSNIP—Improved Guernsey
RADISH—Wood's Early Frame: the very best for forcing
TURNIP—Early Snowball: small, compact sort
Yellow Maltese: excellent for garden culture
Rendle's Early Green Top Stone; large and good

MITCHELL'S ROYAL ALBERT RHUBARB.

This is extremely prolific and produces very large stalks, of a rich red colour—its flavour is delicious—and is remarkable for its extraordinary earliness. It can be most confidently recommended. Fine Strong and Established Roots, 2s. each, or 20s. per dozen.

FLOWER SEEDS.

We have a very superior stock of all the newest kinds, and as some of the choicest varieties are grown under our own inspection, we can warrant them to be quite new and correct to name. SCALE OF PRICES SENT POSTAGE FREE.

TO THE SUBSCRIBERS TO THE

GARDENERS' BENEVOLENT INSTITUTION.

—The case of JOHN SHEPHERD, No. 11 on the List for the next Election (16th January, 1850), and the third application, is most respectfully and earnestly recommended to the Subscribers by Mr. GRISSELL, of Palace-yard, Westminster, who will thankfully again receive proxies. Mr. GRISSELL hopes, with the assistance of the Subscribers, that JOHN SHEPHERD will be successful at the next Election.

TO THE SUBSCRIBERS TO THE

GARDENERS' BENEVOLENT INSTITUTION.

—Your Votes are solicited for EDWARD BEACH, of Quedgely, near Gloucester, a very deserving old man, now upwards of 75 years of age. He has been all his life engaged in the gardening business; but, unfortunately, through losing a great portion of the little money he saved, is now dependent on charity. The favour of your Vote will be highly esteemed He is strongly recommended by Messrs. GARAWAY, MAYES, and Co., Durdham Down Nursery, Bristol; Mr. GEORGE WHEELER, Nurseryman, Warminster; and Mr. J. C. WHEELER, Kingsholm Nursery, Gloucester.

GARDENERS' BENEVOLENT INSTITUTION.

—NOTICE is hereby given, that the ANNUAL GENERAL MEETING of the Subscribers to this Institution will be held on Wednesday next, the 16th inst., at the London Coffee House, Ludgate-hill, for the purpose of receiving the Accounts of the charity for the past year, and electing Officers for the ensuing year; also to consider a Report from the Committee recommending certain alterations in the Rules of the Institution.

An Election of TWO PENSIONERS will also take place from among the following Candidates, whose cases have been examined and approved of by the Committee:

Name.	Residence.	Applic.	Age.
EDWARD MARSHALL	London	8th	70
MARY BROWNE	Do.	6th	84
JOHN SKEATES	Brixton	6th	70
THOMAS MILLS	Dulwich	5th	72
JOHN APPLEBY	Clapham	4th	57
ROBERT DUNCAN	Highgate	4th	70
JAMES BATTEY	Chelsea	3d	66
EDWARD BEACH	Quedgley, Gloucester	3d	75
JOHN COCKS	Brixton	3d	63
RICHARD RUDLAND	Sutton-at-Hone, Dartford	3d	77
JOHN SHEPHERD	Clapham	3d	71
WILLIAM BROWN	Andover	2d	71
RICE EVANS	Stone, Staffordshire	2d	71
JOHN HURDEN	Bath	2d	65
CORNELIUS ROBINSON	Greenwich	2d	70
JOHN SNOW	Farnborough	2d	65
THOMAS FITZGERALD	Fulham	1st	64
JOHN HOPKINS	Nuneaton, Warwickshire	1st	63
HENRY SCHNEIDER	Colerne, Wiltshire	1st	84

The chair to be taken at 11 o'clock precisely. The ballot will commence at 12, and close at 2 o'clock precisely. No person will be allowed to vote whose subscription for the year 1849 is unpaid on the day of election. By order,

EDW. R. CUTLER, Secretary,
January 12. 97, Farringdon-street.

AMERICAN PLANTS.

HOSEA WATERER begs to announce he has just published a New and Complete Catalogue of his AMERICAN and CONIFEROUS PLANTS, which may be had on application, inclosing two stamps for postage to

HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

CUCUMBERS.

THE THREE BEST CUCUMBERS EVER YET SENT OUT.

EDWARD TILEY begs to remind the public generally, that he has now ready to dispose of good sound seed of his VICTORY OF BATH, GORDON'S WHITE SPINE, and LORD KEYNON'S FAVOURITE (this last is the best for winter cultivation). These CUCUMBERS have been thoroughly proved to the satisfaction of hundreds of growers, and need no comment on their superiority. Victory of Bath, 2*s.* per packet; Gordon's White Spine, 1*s.* 6*d.* do.; Lord Keynon's Favourite, or Winter Cucumber, 2*s.* 6*d.* do., or one packet of each of the above Cucumbers, 5*s.*

E. T. begs to mention that he has the whole stock of the seed of that unequalled Melon, "Brougham Hall," Green-flesh; it has surpassed all others this season at the London exhibitions. It is as much superior in flavour to all other Melons as the Greengage is to all other Plums. Sold in packets of 7 seeds, 2*s.* 6*d.* each.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance (either in cash or in postage stamps) must accompany the order.

MANNINGTON'S PEARMAIN.

JAMES CAMERON, NURSERYMAN and FLORIST, returns his best thanks to his friends and the public in general for their liberal support, and begs to say he has now for sale a sufficient quantity of the above valuable APPLE, and is thus enabled to offer them at so reduced a price as to ensure them extensive cultivation. It is a middle-sized variety, and different from any in cultivation, and remarkable for its rich sugary and aromatic flavour, superior in every respect to the Ribstone Pippin. It is in its height of flavour from January till the end of May, and a very good bearer. Strong dwarf maiden plants 5*s.* each; the usual allowance to the trade. Remittances from unknown correspondents, previous to the trees being sent, by Post-office orders, made payable to JAMES CAMERON, Nurseryman, Uckfield, Sussex.

J. C. has also an extensive stock of Fruit and Forest Trees, Quicks, Evergreens, and Roses of first-rate quality.

WILLIAM MASTERS, Exotic Nursery, Canterbury, having the largest and most diversified stock of NURSERY PLANTS in the country, and by long experience being expert in determining the characteristics of various sites of ground, so as to plan and plant them most desirably, offers his assistance to gentlemen requiring the aid of a Landscape Gardener, or wanting Nursery Plants at the most economical prices. Planning and Planting by contract, if required. Communications to the above address will receive immediate attention.

GARDEN SEEDS of a superior quality may be had in Collections of 1*l.*, 2*l.* or 3*l.* worth, containing a supply for the whole year, upon application to the Subscriber. Also, a large Collection of the best FLOWER SEEDS, in assortments of 25 kinds for 6*s.*; 50 for 10*s*; 100 for 18*s.* Larger quantities in proportion. Orders amounting to 2*l.* and upwards delivered to any station on the South Eastern Railway.

WILLIAM MASTERS, Exotic Nursery, Canterbury.

FOREST TREES, &c.

PETER LAWSON AND SON'S LIST.—No. II. for 1850 is now ready, and may be had on application, or a copy will be sent free of postage to any part of the United Kingdom or British Colonies, containing prices of—

Seedling Forest Trees.	Plants for Hedging, Underwood, &c.
Seedling Ornamental Trees and Shrubs.	Quartered Trees
Transplanted Forest Trees	Ornamental and Rare Forest Trees
Transplanted Fruit Tree Stocks	Shrubs, Ericaceæ, & Climbers

Coniferous Trees and Shrubs, including nearly 300 species and varieties, among which are all the new sorts lately introduced.

The next number of "PETER LAWSON and SON'S List" will comprise a Catalogue of Flower Seeds, annual, biennial, and perennial, accompanied by a Treatise, containing simple practical directions for selecting and raising those suitable for cultivation in this country.

PETER LAWSON and SON, Nurserymen and Seedsmen to the Highland and Agricultural Society of Scotland, Edinburgh, have appointed as their

AGENT IN LONDON,

Mr. J. C. SOMMERS, 159, Fenchurch-street, who will afford every information as to supplies of Forest Trees, and Garden or Agricultural Seeds.

*** There are ready and economical means of transit from Edinburgh, both by Steam and Railway, to all parts of the Kingdom.—George IV. Bridge, Edinburgh, Jan. 12.

FISHER, HOLMES, AND CO., NURSERYMEN and SEEDSMEN, Sheffield, beg to offer the following CHOICE CUCUMBERS and MELONS, which they can confidently recommend, being such as cannot be surpassed. Sent free by post.

CUCUMBERS.

BATLEY'S TELEGRAPH.—Light green, fine form, very prolific, 20 to 28 inches. 6 seeds, 2*s.*; 12 ditto, 3*s.* 6*d.*
COPPACK'S HYBRID.—Dark green, extra fine form, very superior. 6 seeds, 3*s.*; 12 ditto, 5*s.*
CONTENDER.—Dark green, large, and very prolific. 6 seeds, 1*s.*; 12 ditto, 1*s.* 6*d.*
LANCASHIRE WITCH. — A great improvement in every respect on the Sion House. 6 seeds, 1*s.*; 12 ditto, 1*s.* 6*d.*
LARRISY'S ST. CATHARINE.—Very handsome and superior, 24 to 28 inches. 6 seeds, 2*s.*; 12 ditto, 3*s.* 6*d.*
READ'S SUPERB.—Fine for early forcing, great length, and very prolific. 6 seeds, 1*s.*; 12 ditto, 1*s.* 6*d.*
SION HOUSE (true).—12 seeds, 1*s.*
VICTORY OF BATH.—12 seeds, 6*d.*

MELONS.

FLEMING'S TRENTHAM HYBRID.—6 seeds, 1*s.*; 12 ditto, 1*s.* 6*d.*
BEECHWOOD (true).—12 seeds, 1*s.*

NEMOPHILA MACULATA, 3*d.*, 6*d.*, and 1*s.* per packet.

A remittance either by post-office order or in postage stamps. The Trade supplied. Separate Catalogues of Garden, Flower, and Agricultural Seeds; Garden Implements, &c.; also Trees, Shrubs, &c., may be had free on application.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall, and are warranted double, and of which large and choice roots are selected at 4*s.* per dozen. Also, expected, about the end of January, a choice collection of Orange, Lemon, Citron, and Shaddock Trees, together with Catalonian, Azorian, and Arabian Jessamine plants, any of which may be bespoke.—N.B. Orders by post punctually attended to.

CHEAP! CHEAP!! CHEAP!!!

CHARLES DALY AND SON beg to refer their friends and the public, who should be in want of cheap Thorn Quick, cheap Irish Yews, cheap Shrubs, cheap Forest Trees, and cheap Early Seed Potatoes at 5*s.* per bushel, to their Advertisement in the *Gardeners' Chronicle* of the 27th of October, and 3d and 10th of November last. Their Catalogue of Garden and Farming Seeds sent free by post, containing a good many of their own growing, which will be seen by their Advertisement.

They will also feel much obliged by their customers paying their last year's account, as they have no wish to put them to expense.—Coleraine, Ireland, Jan. 12.

HOME GROWN SEEDS.

SUTTON'S NEW PRICED CATALOGUE OF HOME GROWN SEEDS, being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL, and FLOWER SEEDS, with prices affixed to each article, will, it is presumed, be found the most useful and convenient of any yet presented to the public.

All purchasers of Seeds would do well to peruse this Catalogue, as the low prices therein quoted will enable them to effect a great saving in their expenditure. It will be sent gratis on the receipt of a penny stamp, for postage.

MESSRS. SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS are now in course of delivery at the undermentioned prices. No. 1, 2*l.* 2*s.*; No. 2, 1*l.* 1*s.*; and No. 3, 12*s.* 6*d.*—Reading Seed Warehouse, Reading, Berks.

COLE'S SUPERB SOLID RED CELERY.—This fine Celery has given such entire satisfaction, not only for the great size to which it attains, but for its unequalled crispness and exquisite nut-like flavour, that it needs no further recommendation. Seed may be had genuine from the grower, WILLIAM COLE, Dartford, Kent, in sealed packets, 1*s.* 6*d.* each, or the amount in postage stamps; also of Messrs. J. and J. FRAZER, Leyton, Essex; Mr. BUNYARD, Maidstone, Kent; Mr. CRIPPS, Tunbridge Wells, Kent; Mr. DENYER, 82, Grace-church-street, London; Mr. TILEY, 16, Pulteney-bridge, Bath; Mr. FRANCIS, Hertford; Mr. MILNER, Bradford, Yorkshire; Messrs. J. and J. FAIRBAIRN, Clapham, near London; Messrs. GARAWAY, MAYES, and Co., Bristol; and of Mr. SMITH, Westerham, Kent. *** A liberal allowance to the trade.

W. COLE further states, in justice to himself and agents, that his entire stock of seed saved in 1849 is in his possession and that of his agents, from whom it may be had new and genuine, bearing his name and address printed on the envelope.

COCHIN CHINA FOWLS.—NEW-LAID EGGS FOR SETTING may be had by applying by letter, post-paid, to W. O., at Mr. Mac Lachlan's, 6, Birchin-lane, Lombard-street, London.

NEW RANUNCULUSES, ANEMONES, &c.

CAREY TYSO, Wallingford, Berks, begs to announce that he has selected Twenty splendid SEEDLING RANUNCULUSES, raised in 1848 and 1849, with which he obtained several first prizes, and which he can recommend for exhibition. Descriptions and prices will be forwarded in a general Catalogue for 1849–50 on receipt of two postage stamps. Selections of 100 named Ranunculuses, 50*s.* to 5*l.* Mixtures, 8*s.* to 20*s.* per 100. Double Anemones, 50 sorts, 20*s.* to 30*s.*

Imported German Seeds: Asters, Stocks, Larkspurs, &c., 20 varieties, per post, 2*s.* 6*d.*

TYSO'S "Treatise on the Ranunculus" can be had of all booksellers, price 6*d.*; or direct per post for eight stamps.

RENDLE'S NEW SEED CATALOGUE.

RENDLE'S NEW BOOK CATALOGUE OF SEEDS is *just published*, and entered at Stationers' Hall. It will be found of much value to all purchasers of Kitchen Garden, Agricultural, and Flower Seeds.

PART 1 *contains a descriptive Catalogue of the best* CULINARY VEGETABLES *in cultivation, with the time of sowing, height, and other useful particulars, as well as the quantities furnished by* WILLIAM E. RENDLE & Co. *for their collections.*

PART 2 *contains a descriptive Catalogue of all the choicest and best varieties of* AGRICULTURAL SEEDS.

PART 3 *contains a most excellent descriptive List of all the newest and choicest* FLOWER SEEDS, *giving—1st, the hardiness and duration of each variety; 2d, the colour; 3d, the height; and 4th, the time of flowering. Also some useful information and advice relating to the proper mode of culture, with the manner of testing the quality of good seeds. It gives also a full detailed list of all the best German seeds, such as Stocks, Asters, &c., as well as the quantities furnished by* WILLIAM E. RENDLE & Co. *for their collections.*

Copies of this valuable Catalogue can be obtained on application *gratis*, by inclosing two penny stamps to pay the postage.

Complete Lists of the sorts contained in each collection will be found in our new Book Catalogue.

All orders above £2 will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.

Railway and Steam communication to all parts of Great Britain and Ireland.

For Catalogues and further particulars apply to
WILLIAM E. RENDLE & CO., Union-road, Plymouth,
ESTABLISHED 1786.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes ...	8s.	Early Manleys	7s.
*Early Round Frame ...	8s.	Early Cockneys	7s.
Early Ash-leaved Kidney	8s.	Fox's Seedling	7s.

Second Early Potatoes for Winter and Spring use:

American Native Potatoes	5s.	Kentish Pink Kidney ...	4s.
York Regents	5s.	Forty Fold	4s.

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.—No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pkts. Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. £3 3 0
No. 2, two-thirds of the above 2 2 0
No 3, one-third ditto 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2 feet, is 3 weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5s. per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetar's, and 20 to 24 per stem. 2s. per quart.

BURBIGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1s. per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be furnished on application, and every article connected with the trade supplied on terms to defy competition. Garden Tools, Nets, Mats, Mushroom Spawn, and Potatoes saved from selected stocks at moderate prices.

NEW STRAWBERRY, "STIRLING CASTLE PINE."—The Subscriber begs to intimate that he has purchased the Stock of the above from the raiser, Mr. LAING, of Stirling. Its principal characters are as follows: Size of fruit large, classing with Keens' Seedling, British Queen, &c.; Form, somewhat irregular, inclining to conical; Colour, pale red, or scarlet when fully ripe; Flavour, excellent, partaking of that of the old Red Pine. It is also very prolific. Having been raised in 1846, it has now been thoroughly proved, and the following notices of it, selected from many others, will, it is hoped, be a sufficient guarantee for its superior merits:

"We recommend Mr. Laing to propagate this variety and advertise it, as, from the specimens submitted to us, we consider it a most valuable addition to this useful family of fruits."—*Mr. Macintosh, in North British Agriculturist of Aug.* 1.

"This Strawberry seems to be an abundant bearer; fruit large, juicy, and high-flavoured. It may rank as a first-class fruit, will succeed the Keens' Seedling, and prove an excellent market variety."—*Mr. Macnab in Report of Caledonian Horticultural Society.*

Plants can now be sent out, 20s. per 100, or 3s. per doz. Post-office orders or references required from unknown correspondents.—ROBERT M. STARK, Edgehill Nursery, Edinburgh.

SUPERB NEW MELON.

GARAWAY, MAYES, AND CO., having purchased the whole stock of seed of that superior MELON called CAMERTON COURT GREEN-FLESH, beg to inform all lovers of this delicious fruit, that they can supply it in packets at 2s. 6d. each.

Notice of Fruits, in Gardener's Journal of September last.—"J. P. Your Green-flesh Melon, about 2½ lbs., is a neat, well-grown fruit, sweet, and melting, and the flesh thick." For the 25th September.—"This is really (we gladly confess it) a very good Melon."

G. M. and Co. have likewise the whole stock of the BRISTOL CHAMPION CUCUMBER, which they can strongly recommend. With the following approved sorts.

Bristal Champion—long, hardy, black spine; excellent. 2s. 6d. per packet.

Holm Pierpoint Wonder—fine long white spine. 1s. per pkt.

Great Britain, excellent; Victory of Bath, excellent; Roman Emperor, early long prolific; and Cuthill's Black Spine, all at 1s. per packet.

Sion House, (true), best for house culture, 1s. per packet.

Kelway's Victory, very prolific black spine, excellent for pot culture, 1s. per packet.

Beechwood Melon, Duncan's improved green-flesh, Cabool, Cuthill's early scarlet flesh, Hampton Court, and Egyptian green flesh, all at 1s. per packet.

G. M. and Co. have now their large stock of Vegetable and Flower Seeds for this season, with the following new and approved varieties, well worth the attention of their friends.

Railway Peas, the earliest known, fine pod; Champion of England, ditto, excellent for second crop; Great Britain, British Queen, Pond's or Ward's Incomparable, varieties of Knight's Marrow, the finest Pea grown; Norris's Superb Dwarf Cabbage; Bundy's fine dwarf Brussels Sprouts; Highclere White Broccoli, the latest known, lasting until Cauliflowers come in; Walcheren Broccoli, true; Coles' Superb Red Celery, from the grower; Superior Garnishing Parsley; German Stocks and Asters, imported annually; Nemophila maculata, new; Phlox Drummondi oculata, new; Ipomœa rubra cærulea.

Durdham Down Nurseries, Bristol, Jan. 12.

SLATE WORKS, ISLEWORTH.—The following articles, manufactured in Slate for Horticultural purposes by EDWARD BECK, may be seen in use at WORTON COTTAGE, upon application to the Gardener, Sundays excepted. Orange Tubs, Plant Boxes, Tanks, Cisterns, Shelves, Garden Path Edging, Hot Water Tank Covers, Flower-beds for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c.

Estimates given for Work as shown upon Drawings and in Specifications. A large stock of Slate Slabs, of all sizes and thicknesses, kept on sale.

THE REAL CASSABAR MELON.

THE LARGEST AND FINEST MELON IN THE WORLD. J. WEEKS AND CO. beg to offer to the Nobility and Gentry the above for Sale, at 5s. per packet. Early orders are requested, there being but a limited quantity to dispose of.—J. WEEKS and Co., King's-road, Chelsea.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to offer the following new PEARS, which will be found faithfully to answer the description given of each, they having been tried and proved these last five years:

BEURRE ST. HELIER.—Ripens February and March; large, brown, melting, first quality; trees vigorous. Will do well as a pyramid or on a wall; all the trees are not less than two years old; fine strong, on Quince stocks, 10s. 6d.

BEURRE DELAVAL.—Ripens November and December; fine waxy colour, size of a large Crassane, melting, excellent; pyramid or north-west wall will suit it well. Most of the trees are in a bearing state; stock limited. 10s. 6d.

GABOURELLE'S SEEDLING.—Round kitchen fruit, the greatest bearer of Pear trees. Ripens December and January; well adapted for orchards, for which the trees are principally trained, and are very vigorous; from 6s. to 7s. 6d.

R. L. regrets that the following should have been omitted in the printing of his Descriptive Catalogue, but they will be found excellent and melting, *viz.*, LANGELIER'S BEURRE and BEURRE LEON DE CLERC. Those who may have received them, may be assured they are of first-rate quality; so is GROSSE CALEBASH. Having a large stock of superior grown trees, on Quince stocks, all grown and proved by R. L., he has been induced to reduce his price as follows, if the selection is left to him; none but the best melting sorts will be sent, and he will be responsible for their accuracy. Baking or kitchen Pear, is desirable, as a melting sort, being so useful for a family.

24 trees of best melting, strong and healthy, one of each ... 36s.
24 do., one of each, from 3 to 4 years old, both Quince and own stock ... ... 48s.
24 do., bearing trees ... ... 60s.
50 do., large, not less than 4 or 5 years old ... ... 70s.
50 do., larger, well grown and fine ... ... 90s.
50 do., very large ... ...125s.

The trade supplied with any quantity at per 100 or per 1000.

R. L. will supply from 200 sorts and upwards, only one of each, first quality, at 10d. per 100; many will be in a bearing state.

Application to be made to Messrs. PIPER, 23, Paternoster-row, London, for the Descriptive Catalogue. Fine Camellia stocks for grafting or planting in shrubberies, where they do well, from 40s. to 50s. per 100; also a superb collection, all strong and healthy, of which a Catalogue will be published separately, as well as Vines, of which R. L. possesses an extensive and select collection, also proved by him. A remittance or reference from unknown correspondents.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per ft.

HEATING BY HOT WATER.

CUCUMBER AND MELON BOXES AND LIGHTS.—One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 6s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England.

JAMES WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

TO PARENTS AND GUARDIANS.

A LADY, residing near Eccleston-square, Pimlico, begs to offer a Comfortable Home to one or two Young Ladies, who may require the care and attention of a mother. Good references given and required.—Address, H. D. D., care of W. Parkins, Stationer, 25, Oxford-street, London.

POLMAISE HEATING.

J. LEWIS'S IMPROVED POLMAISE STOVES are delivered to the Railways in London, with Plans for fixing. For a Greenhouse: 20 feet by 12, 6l. 10s.; 30 feet by 14, 8l. 10s.; 50 feet by 18, 10l. 10s. Stoves for Churches, Schools, and Halls, according to size.

Hothouse Works, Stamford-hill, Middlesex.

STEPHENSON AND CO., 61, Gracechurch street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GLASS PIPES.

MESSRS. COATHUPES AND CO., GLASS MANUFACTURERS, of Bristol, and of Nailsea, Somerset, beg to inform Engineers and others, that they are prepared to supply GLASS PIPES of from 1 to 4-inch bore, in lengths of from 3 to 7 feet—be lengths being less as the diameters of the bores increase.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded, on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

SUBSCRIPTION ON BEHALF OF WM. HOWDEN, LATE FOREMAN, INVERLEITH NURSERY.

It is now generally known that Mr. WILLIAM HOWDEN has left the situation he held as Foreman to JAS. DICKSON and SONS, Inverleith Nursery, where he was upwards of Forty years, and is understood to be in very infirm health. It has been suggested by a number of his friends and acquaintances, that, in his present circumstances, some mark of respect should be shown him by his brethren, to testify their estimate of his character and approval of his conduct during the long time he held the above situation. Those, therefore, desirous of subscribing can do so to any of the following Foremen in the Edinburgh Nurseries, viz., Mr. P. S. Robertson, Golden Acres; Mr. Melrose, Mignonette Bank; Mr. Alexander Tait, Leith Walk; Mr. Archibald M'Keith, Warriston Lodge; or to Mr. James Kelly, Nurseryman, Tanfield; Mr. Thomas Methven, Nurseryman, Stanwell Lodge; Mr. Charles Alexander, 1, Waterloo-place; Mr. John Peacock, 1, George IV. Bridge. Early subscriptions are respectfully requested; and it is proposed that after a reasonable time a Committee shall be formed of the Subscribers, to present the money in any way they may think best suited to his present position.

P.S.—It is hoped all friendly to this object will give those that are employed under them an opportunity of contributing. To save expense, two or three may join and remit per post-office order, and small amounts can be sent in postage stamps.

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. HARTLEY and Co., precisely at their prices. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½d. per foot.
10 by 8	,,	14 by 10	at 5d. ,,
14 by 10	,,	1½ foot	at 5½d. ,,
1½ foot	,,	3 feet	at 6d. ,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10s. 6d. 8 by 6 and 8½ by 6½...13s. 6d.
7 by 5 and 7½ by 5½...12s. 0d. 9 by 7 and 10 by 8 ...15s. 0d.

Milk Pans from 2s. to 6s. each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 10d. each; Wasp Traps, 3s. 6d. per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7s. 6d.; 6 tubes, 10s. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

JAMES PHILLIPS and CO., 116, BISHOPSGATE STREET WITHOUT, LONDON.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

BECK'S PELARGONIUMS, and other raisers' Flowers.—Now ready for selection and going out. Twelve of the following varieties, including box and carriage to London, will be forwarded in exchange for post-office order on Brentford for Two Guineas. They are well-rooted in 3-inch pots, and ready for an immediate shift into a larger size:

Blanche, Centurion, Cracker, Forget-me-not, Ariel, Cassandra, Cruenta, Gustavus, Gulielma, Grandiflora, Junii, Negress, Rosamond, Sundown. Or Nine of the above, and Hoyle's Crusader, or Foster's Victory.

EDWARD BECK, Worton Cottage, Isleworth.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

MYATT'S LINNÆUS RHUBARB.

J. MYATT AND SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1*s.* 6*d.*; ditto, Mitchell's Royal Albert, 1*s.* 6*d.*; Victoria, 9*d.* The usual Trade allowance.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford.—Jan. 12.

CLERODENDRON BETHUNEANUM.

HUGH LOW AND Co. have much pleasure in offering the above-named most beautiful plant. It was introduced by them from Borneo, and is figured and described by Sir Wm. J. Hooker in the December Number of the Botanical Magazine. Strong established plants, 63*s.* each. A Catalogue of their general collection, stamped, and free by post; also a list of Vegetable and Flower Seeds, containing the best and most approved varieties, may be had on application.

Clapton Nursery, London, Jan. 12.

WE have received from the METROPOLITAN SEWAGE MANURE COMPANY the report made by the directors at a late half-yearly meeting of the shareholders. The conclusions at which the directors have arrived being founded exclusively upon horticultural evidence, the subject is thus brought directly within our peculiar province.

We might criticise some of the calculations produced upon the occasion referred to, such for example as the estimate of a clear gain of from 18 to 23 per cent., after the completion of the works, which appears to us to be wholly fallacious; but we prefer for the present to leave the question of profit and loss to be settled between the shareholders and directors, confining ourselves to an examination of the evidence obtained from Market Gardeners as to the effect of London sewage on their crops. In a case of this nature amateur evidence is less satisfactory. The general result of this experience is as follows:

1. Growth is more rapid and healthy after the application of "sewer water." (*Bransgrove, Miller, G. and W. Bagley, Crouch.*)

2. Vegetables increase in size; but its effect on trees and shrubs has not been observed. (*G. Bagley, Miller.*)

3. The yield of Raspberry bushes is much improved; but nothing further observed. (*Miller.*)

4. It lessens blight. (*Bransgrove, Broadbent, W. Bagley, Crouch, Miller.*)

5. No offensive odour. (*All the witnesses except Bransgrove, who found a* "very little.")

6. As to any improved price obtained for the crops the evidence is inconclusive, except in the case of Carrots.

From these general statements the report proceeds to particulars, and similar evidence is brought forward in proof of the advantage of "sewer water" to Potatoes, Radishes, Vegetable Marrow, Onions, Cabbages and Broccoli, Seakale, French Beans, Turnips, Carrots, Strawberries, Raspberries, Cucumbers, Celery, Rhubarb, and Peas. In Beet the *plants* are reported by Mr. MILLER to have considerably increased in size, but nothing is said of the *roots*; and Mr. CROUCH gives evidence of the goodness of Broad Beans *when in blossom*, but he says nothing of the crop when *in pod*. The advantage to Currants, Gooseberries, and Rose trees, is doubtfully reported on.

We think that, upon the whole, this is a fair statement. The reports are not very encouraging; and may therefore be regarded as the more trustworthy. We cannot, however, draw from them the inference that the "sewer water," spoken of in the report before us is worth so much as the advocates of liquid sewerage have believed. The money gained by the employment of the fluid, beyond what would have been received without it, is nowhere stated; and yet this is the only test of the advantages attending its application. All other statements are vague and insufficient. When a man says that his crops are better, in consequence of the use of a certain manure called *x*, we seek in vain to compute the amount of gain. But if he says—I had 10 acres of Cabbages, half manured with *x* and half with *m*, and I sold the crop on *x* for 2*l.* an acre more than the crop on *m*, then we know that it is worth while to pay 30*s.* or 40*s.* for the use of *x*. No such information is to be found in the report of the directors.

But there is another question. Do the reports now produced, such as they are, represent truly the effect of using liquid manure? We think not. They appear to represent little more than the effect of irrigation. A deluge of Thames water, skilfully applied, would probably have produced results as good. The market gardeners declare, with one trifling exception, that there was no offensive smell whatever, at the time of application; and Mr. WATSON, an amateur, whose testimony we have purposely omitted, speaks to the same fact. If we are not misinformed, there are those who actually drank the "sewer water" as it came from the Company's mains, without perceiving any quality that did not belong to river-water. It may therefore be doubted whether the Company, in their anxiety to avoid over-strong drenches, which would be disadvantageous, have not followed the example of the homœopathists, and been supplying their customers with infinitesimal doses.

For this reason we regard the report of the directors as one which represents the effects of sewage water in a light less favourable than it deserves. There can be no doubt that the liquid which passes from the London sewers will exercise a far more striking effect upon crops than anything here testified to, provided it is applied in sufficient strength, and skilfully. What the Company should do, with a view to their own interests, is to obtain leave to apply their sewage to half some considerable crop, say a dozen acres, of any kind of kitchen garden produce; and when the crop is ready for market, to call together competent and unbiassed judges, in whom the public places confidence, who shall examine and report upon the result in a business-like way. It is a very great question for London, and one which ought to be settled without further loss of time. In fact, until this is done, all consideration of the various schemes which have been proposed for draining London is premature. Is the sewage water of London worth saving, in a *pecuniary point of view*, or is it not? That is the main question. If it costs 30*s.* an acre to apply it to crops, and the advantage is represented by 40*s.*, it seems clear that any plan for draining London, in which the sewage is wasted, must be put aside. On the contrary, if the reverse should prove to be the fact, the best plan will then be the one which gets rid of it in the quickest and cheapest manner.

Towards the solution of this fundamental question no approach seems to have been hitherto made. It is admitted on all hands that sewage water is valuable; but nobody has satisfactorily shown what the real relation is between crop and cost, so far as the metropolis is concerned.

A QUESTION has arisen as to whether Gardeners are justified in taking APPRENTICE FEES from their workmen. We should have thought that only one answer could possibly have been returned—and that in the affirmative—*provided they do so with the permission of their employers*. Why not? What specious reason can there be why gardeners should be deprived of that reward of experience and skill which other classes receive, and to which, under certain conditions, the law itself gives them a claim.

The advantage attending the system of binding youths to trades for a specific period, in order to gain a knowledge of the daily practice requisite in each department of their art, cannot be attained without some stimulus to the exertions of their master; and since no incentive but one of a pecuniary nature can be supposed capable of producing the desired attention to a lad who has no other claim on his employer, it has followed, as a natural consequence, that tradesmen and mechanics demand an allowance, in payment for the service they render. Laws are framed expressly to protect the two parties to this beneficial agreement. Why gardeners are not to enjoy advantages which belong to other callings is more than we can understand. Nevertheless many persons blame, with no little severity, the gardeners receiving recompense from these negociations. Let us examine the arguments on both sides of the question, and endeavour to lead the reader to a satisfactory conclusion.

The small number of lucrative situations in the business of horticulture, and the comparatively low salaries received by gardeners of all grades, are the principal reasons why it is considered that premiums should be dispensed with. We do not admit that they would be valid ones, even if boys were not usually allowed wages fully equal to the value of their labour, and head gardeners were so comfortably provided for as not to need some assistance of this description. The man who expends a large amount of time and trouble in completing his acquaintance with gardening affairs, and who contents himself with a salary inadequate to his proper maintenance during so many of his earlier years, has a clear right to be paid by his younger brethren for the communication of that intelligence which will ultimately place them in a similar position. Knowledge not only gives power to its possessor, but it also supplies him with wealth, if rightly used; the readiest way of turning it to account being by instilling it into others. This is both justifiable and laudable. The abandonment of all the profit derivable from such a source is more philanthropic than commendable.

But then it is said that gardeners pay no attention to their apprentices; that the apprentice fee is all they think of. And this is true enough of some men, whose conduct is a disgrace to them; but it is not true of all, nor of many, and it is preposterous to condemn a system because men are to be found who abuse it. The same thing happens in all walks of life. A correspondent suggests that the system would be much improved if a portion of the premiums paid by the friends of the apprentice were shared amongst the different foremen of the garden in which he is situated, because on these must necessarily devolve the practical instruction; or at least, that the principal gardener might offer a reward to those in whose department the apprentice manifestly made the greatest progress. This is a point on which we do not feel called upon to offer any remark; such things should be left to private arrangement.

Another circumstance that strongly inclines many to oppose premiums is, that they are sometimes estimated by proprietors as a part of the gardener's salary, the latter being reduced in consequence. We cannot too highly deprecate this principle. On no reasonable grounds can a gentleman be entitled to the profit arising from his gardener's skill in teaching. Surely it is reasonable thus to compensate a gardener for his previous toils, and for the communication of their results to the young men placed under his charge. But as for premiums exacted from journeymen under the pretence of affording them opportunities for improvement, these are totally indefensible upon any principle whatever.

We think, too, that other reasons may be given in favour of apprentice fees; they tend to keep the profession select and respectable. The simple fact of a parent being able to expend 20*l.* or more upon his son's professional education (although this, in itself, is a comparatively trifling sum) may be taken as a security for the respectability of a young man's connexions, and for his possessing at least a reasonable amount of school education. If having undergone the process of apprenticeship were invariably insisted on as a qualification for a good gardener, there cannot be a doubt that an entirely different state of things to what at present exists would immediately ensue. All the upstarts who are now so abundant, the ignoramuses who, by dint of impudence, overreach the more modest gardener, and the persons who from a variety of low callings have elevated themselves into notice by any means rather than professional skill, would fall back into those places which alone they are competent to occupy, and talent would meet with the consideration it deserves. This would be one of the excellent consequences of a universal demand of apprenticeship fees.

They are further beneficial, from the effect they produce upon the apprentice himself. Finding that his relations have expended a certain sum on his behalf, he will, if at all guided by right feeling, be led to reap every possible profit from his station, so that the money provided for him may not be spent in vain. He thus learns to set a greater value on time; to employ and improve it in the best manner; and he becomes continually impressed with the importance of making the most of those years and occasions which he perceives are regarded as so important by the parties with whom he is connected. Nor must the claims which a premium gives the apprentice on the gardener to whom it is accorded, be for a moment forgotten. He thus acquires a positive right to his attention and care, and nothing but a want of good moral feeling can supersede that right. Finally, the gardener himself is thus elevated to a higher rank in the eyes of the rest of the world, when it is discovered that his profession is not a

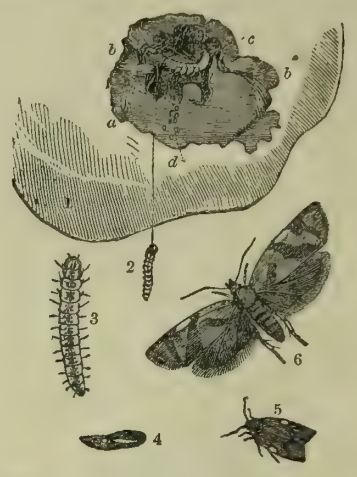
matter which can be compassed in a very short time, but that several years of unwearied perseverance are essential to the mastery of even its outline.

These remarks are thrown together partly in the hope that they will assist in settling some differences which have come to our knowledge, but more especially because we believe that a very wholesome old English practice has fallen into some disrepute, owing no doubt to the scandalous neglect of their apprentices by some who take them. But we must not be understood as countenancing in any way the habit of taking apprentice fees surreptitiously. To place the apprentice in his proper place, and to give the system of apprentice fees its true value, the employer must be a party to the binding as much as the gardener himself; his full consent must be obtained, and he must be made perfectly aware of the effect which the reception of apprentices has upon his own interests. This arranged, as it in many cases would be very easily, there can be no doubt that the advantages to horticulture would become apparent in a very few years. The number of lads applying to a gardener for reception as apprentices in his master's establishment would be of itself a guarantee of the excellence of the gardener himself.

We repeat, however, that the sanction of the employer is indispensable; to take money of men for their places clandestinely is not only a direct fraud, but a dirty trick, disgraceful to all concerned in it.

VILLA AND SUBURBAN GARDENING.

THE pruning and training of the Grape Vine are subjects that have been often discussed, each person upholding, with much earnestness, the system he follows. Different modes of proceeding may be applicable under particular circumstances; for one general plan can scarcely be applied universally, nor would it be in all cases alike successful. But I shall content myself with stating for their guidance the system most generally to be relied upon, easily understood by amateurs, and which involves little difficulty in its practical execution.



Suppose a young Vine to have been planted, and to have commenced growing, only one shoot should be permitted to run up the trellis. This shoot may be allowed to grow without stopping, until it reaches the top of the rafter; one Vine will always be found to be enough for one light, more especially as the amateur will require to use his Vinery for plants in winter, and even during summer. Numbers of plants are not injured by the partial shade of Vines, and the blossoms of many are prolonged thereby. In the autumn, when the wood is perfectly ripened, this one shoot may be cut down to the bottom of the roof sash, *i. e.* to the angle where the upright sash or wall meets it; for it is between this part and the top where Grapes are to be produced. In the second year the Vine will push strongly, making a vigorous shoot the whole length of the roof sashes early in the summer, even without artificial heat. This shoot should be stopped, as has been already recommended, at the highest point of the house. In consequence of its early growth, the wood, in most instances, will be perfectly ripe by the end of summer. It will be observed that Grapes are not to be obtained until the third season after planting, and then only a limited crop should be taken from the Vines. When the autumn pruning arrives, the before-mentioned shoot should be shortened two-thirds back, allowing only one-third for bearing. It will be found in spring, if all the conditions here set forth have been strictly complied with, that it will push and show for fruit at every eye, probably at some eyes two and three bunches will appear, but these should all be removed except one; a bunch to an eye is enough; over-cropping is a serious evil, and should at all times be guarded against. The bunches, and berries too, will always come small under such conditions. They are also more liable to shank, and to be of indifferent colour. The leading or main shoot, which has sprung from the top eye, must be trained as before to the extreme point of the house, and then stopped. The lateral shoots producing the fruit should also be stopped one eye in advance of that from whence the bunch springs, and the successive laterals which make their appearance during the season must also be removed at this joint. It must be borne in mind, that although it is necessary to remove the superfluous laterals, none of the leaves belonging to the main stem or principal side shoots must be mutilated or taken off on any account, for on these not only depends the proper ripening of the current year's crop, but also that of the following season. *Pharo.*

THE PEAR MOTH.

TORTRIX ANGUSTIORANA.

THE economy of this insect has been hitherto unknown, and I believe no one suspected it of being an enemy in the orchard. The French seem not to have been acquainted even with the moth, until M. Dupouchel received it from Russia; it is pretty certain that neither Linnæus nor Fabricius knew it, and in England it has only been recorded as an inhabitant of various parts of the kingdom. It makes its appearance in June, but I have found specimens upon the palings in the Regent's Park during the whole of July. It is to Mr. F. J. Graham, of Cranford, we are indebted for a knowledge of the early states of this insect; and njurious as the caterpillar is to the Pear, I doubt not its history will interest pomologists; and if its publication should tend to the preservation of the "Queen of English fruits," I shall feel gratified.

Last January (1849), Mr. Graham gave me two Pears, the crowns of which had a large brown patch surrounding the calyx (fig. 1, *a*), with very fine delicate webs (*b b*) attached to the stamina and withered calyx, and extending to the margin of the spot. On cutting away the calyx I found the caterpillar, which it was impossible to discover before, concealed under the projecting margin, as shown at *c*, and on disturbing the creature it dropped by a thread from its mouth (2); it was a quarter of inch long, of a dirty greenish ochreous colour, and reddish brown down the back; the head was ochreous, with a square labrum, and two minute antennæ, having two pointed brightish brown spots at the base, and a line of the same colour on each side, with minute black eyes; the thoracic segment is ample, horny, shining, and ochreous, variegated with brown; there are 8 or 10 minute tubercles on each segment, from which arise longish hairs; the six pectoral legs are spotted with black, and it has eight abdominal and two anal feet; 3, magnified.

My caterpillar died, but Mr. Graham having placed one of the Pears in a tumbler glass, covering it with paper, the caterpillar spun up in one of the folds, and changed to a pupa (4) of a bright brown colour, and on the 7th of June a female moth hatched, of which the following are the characters: Tortrix angustiorana of Haworth, rests with its wings nearly flat upon its back, the edges of the upper ones meeting and entirely concealing the under wings. The wings of the female expand 7½ lines; it is of a cinnamon colour; the antennæ are short and the palpi slightly project in front; the upper wings have several darker rusty marks, one an oblique oblong patch on the inferior margin near the base, only extending to the disc; an indented and oblique one in an opposite direction, quite across the wing, from the middle of the costa, where it is narrowest, to the anal angle, where it is broadest; a third extends from the costa, where it forms a large spot, to the cilia, near the same angle; the pale spaces between this and the central band and the apex, are more or less ornamented with spots between the nervures, and are margined with silvery or shining lines, and there is a black dot with a pale margin in the centre between the second and third bands, and sometimes an ochreous oval spot exactly at the centre of the costa; the cilia are bright tawny; under wings not large, black, with a coppery tint, cilia lighter; fig. 6, magnified. The male is smaller, expanding only 6 lines; it is much darker, especially the head, thorax, and upper wings, which are silky dull grey, the markings are larger and dark cinnamon, shaded into purplish black at the base and along the costa, excepting the ochreous spot, which is less distinct, or entirely wanting.

The moths are inconstant in the tone of their colouring, which led Mr. Haworth to describe a variety of the male as Tortrix rotundana. In France it has been published by M. Dupouchel as Pædisca Dumeriliana, and M. Guené has given it the generic name of Batodes.

The injury which this caterpillar does to the finest sorts of keeping Pears renders it desirable to find a remedy; but except by searching for the maggots in the eyes, whenever any of the web, which is of the most delicate texture, is discoverable, and picking them out, I cannot suggest any mode of extirpating this pest that would not at the same time taint or injure the fruit. In a state of nature, in all probability, the caterpillars spin up amongst the withered leaves, or in chinks in the bark, to undergo their transformations; and as many more enemies of this delicious fruit resort to the same sources for hybernation, nothing can be more judicious than to sweep up the leaves and burn them, or to subject them to speedy fermentation, at the same time keeping their stems clean.

I cannot refrain from remarking how seldom we get *good* Pears in *prime* condition. Is it our seasons, indifferent varieties, or uncongenial soil, that cause such failures? I am disposed to think that proper attention is not paid to the selection in the first instance, or that there is a vast difference in the qualities of the same varieties; that one stock of Chaumontel, for instance, will not bear comparison with another in the next garden even. I may add that Hayes, near Uxbridge, is a stiff clay over gravel, yet there are in various gardens there some of the finest Pears I ever ate; and one at Magdalen Hall, which I think equal to any I have tasted, Mr. R. Thompson has pronounced to be a new variety, grafts of which I had the pleasure of sending to the Horticultural Gardens and to Mr. Graham. *Ruricola, Belitha Villas, Barnsbury Park.*

DISEASES OF PLANTS.

(*Continued from p. 5.*)

Sixth species; NECROSIS OF THE FOLIAGE.—The leaves of all vegetables are liable to a double *necrosis*, which, either in whole or in part, disorganises and dries them up, reducing them at last to a black powder. A very hot wind in summer, a hoar-frost, or extraordinary cold in spring, more especially, produce the effect. It will be readily conceived how injurious this disease will be to the plant, particularly when the young buds are not yet fully developed. The leaves both nourish and protect them, and if they fail, the buds cannot but suffer extremely. In the neighbourhood of any habitation where there has been a conflagration, or wherever frequent fires produce much smoke, this necrosis will also appear very commonly.

It is very difficult to counteract these different species of malady, to which may probably be reduced some others which produce analogous effects. Nor is it easy to prevent the consequences which result to the plant, which are in most cases fatal. But before mentioning the preventive or curative methods which may be tried with the plants attacked, I propose, for the sake of amateurs, to enter into a few considerations on the effects of frost and cold upon plants, which may afford matter for useful reflection.

The most careful observers of nature are agreed, that the damage occasioned to the vegetable economy is not so much from the intensity of the cold, as from the circumstances which precede, accompany, and follow it. It is true that the winter frosts, by congealing the vegetable fluids, increase their volume and cause a laceration and bursting of the vessels. But, as in this season, the masses formed by the low temperature are gradually dispersed as it gently rises, the natural stimulus produced by the gradually returning heat is sufficient to restore the healthy action of the plant. Sometimes, however, it freezes in spring so as to produce the laceration of the vessels, and then the appearance of the sun restoring suddenly with great force the motion of the juices, this rapid alternation must be most fatal to the plant. The same thing may be said of the cold which in autumn strikes the branches or buds, which are as yet scarcely formed, and have rarely attained sufficient strength to resist it. There is also another consideration; those plants which rest in winter, are before that period too weak for the development of that vegetation which is brought out by the first heats of spring, and very sensible to a slight degree of frost. The frost, however, coming at its proper season, not suddenly, but increasing gradually, is of much greater benefit to plants than is generally believed, especially to those which grow in the temperate zones. The cold (according to the theory of the celebrated Thouin) closing by degrees the pores of all the upper part of the plant, causes the sap to descend into the roots, where it has not to fear the effects of frost, being protected by the soil, or in very cold situations by the thick bed of snow. Spring frosts are the more fatal in proportion to the clearness of the atmosphere, and as the rays of the sun strike with more power upon the plant. It has been observed that the cold coming from the north or the west does less damage than that from the east or south; and it is a fact that, under the two last exposures, plants suffer much the most. Of this I have often had occasion to convince myself. In the extraordinary cold of the 27th March, 1805, in the garden of the University, the young shoots of some Pears under a south wall suffered much more than those of the Apricots exposed to the north; the former lost all their flowers, whilst the latter preserved them.

Agricultural works are full of methods by which, according to various writers even of great reputation, vegetables may be protected from frosts or its fatal effects warded off. But most unfortunately they can only be put into practice in a very restricted extent of country, and for very few individuals. I will, however, mention some of them. I will commence by observing that, in regard to certain plants, there may be means of diminishing if not of avoiding the evil in question. When the winter has been unusually mild, and the earth has never properly felt the frost (or as our Lombard proverb has it: "the winter will not stick to the sky") so that it may be feared that the cold will come on in spring instead of at the proper season, those operations by which the vegetation of some plants are accelerated must not be hastened. Thus, as Vines shoot forth the more rapidly, the sooner the working the ground round them is commenced, we should be careful not to touch the vineyards till we may reasonably conclude that the season is settled.

It has been recommended to light fires, feeding them with moistened straw, which will give out a much denser smoke than when dry. They must be lighted up towards sunrise, and so placed that the current of air which prevails at the time shall carry the smoke in amongst the Vines or the branches to be protected. Otherwise they would be of no use. This is a very good plan for preventing the mischief of hoar frosts in spring. It may appear rather tedious, but is the most certain. *On this occasion I may be excused in lamenting the fate of those who, devoting themselves to theoretical agriculture, for the illustration of practice, are consulted by*

amateurs and cultivators for a preservative or remedy for one or another of the numerous evils which afflict plants. They are expected to find an expedient in every disaster; and that is not all, it must be easy, economical, and such, in a word, as that it may cost no more than a breath to attain the desired results. That is for the most part impossible. It must be considered that the difficulties to be overcome are often not commensurate with the powers of man. Nature is stronger than he, and it is only by great labour and uninterrupted perseverance that he is ever enabled to obtain what he desires. I repeat it, agriculture must divest herself of the clothing of quackery which some are trying to fit on to her. It is a difficult art. Our studies have only revealed us a very few of Nature's secrets, most of which she keeps jealously concealed. He however who is disposed to work, and does it with method and without being alarmed at its tediousness, will often succeed in his undertaking.

Watering, also, with water fresh from a well or from a temperate spring, may produce an excellent effect on plants in flower or with their buds ready to open, if done towards sunrise. Others have prescribed the winding round the stems of trees a rope, one end of which should be immersed in a vessel of water, thinking that by this means the caloric of the water may be communicated to the tree and save it. But, in the present day, this method is rejected as being quite useless. Roofs of matting or straw may protect some espaliers or a few other plants. Some are in the habit of placing amongst the Vines tall branching plants, which, by sheltering them from the winds, may prevent *necrosis*. But, can any of these things be done in the open country? Do the favourable results obtained by any one person prove the certainty of success in other cases? The care of the cultivator must rather be directed to ward off the consequences of the evil, which are in so many cases aggravated by the unskilfulness and obstinate ignorance of him who directs the rural works. It is certain that the injured branches must be cut off, but it is equally prejudicial to omit this operation or to do it too soon. It should not be done till the flow of the sap is stopped, that is, till the beginning of summer. But, in general, the greatest mischief amongst us is caused by no one giving himself the trouble to cut away the boughs which the cold has rendered incapable of vegetation. The Walnut is perhaps of all the trees of our country the one most subject to necrosis of the branches. From the neglect of pruning off these branches many individuals are lost or very much injured.

Although plants cultivated in gardens, from being more delicate, have the most to fear from the consequences of these evils, yet they have the advantage of being more easily treated. Plants struck by autumn or spring frosts have been entirely restored by putting them into dark rooms before the sun or even a single ray of light has reached them. In almost all circumstances the necrosis can be prevented in proportion as the expedients proposed are more applicable to gardens than to the open country.

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

(*Continued from p. 4.*)

Proceeding towards the north from the Magnolia Garden the way lies through a grove of Cedars of Lebanon, grafted 10 feet high with the Deodar. In front of these are lines of tall Irish Junipers. This grove leads to the lake, which all at once bursts upon the view, just where one could hardly have expected such a magnificent feature to exist. From this particular spot its smooth crystal-like surface of vast extent, abounding with huge rocky decorations, which are clothed occasionally with lofty Pines, is advantageously disclosed. A high irregular mass stands out boldly in the fore-ground, covered with Araucaria imbricata to the summit, and intermixed here and there with occasional groups of Broom and other plants. To the right of this the eye reaches for at least half a mile across the water, without discovering any visible termination. Turning to the left, we enter the Fountain Garden, which comprises various jets that rise 40 feet high out of a basin of an irregular form, margined with variegated Thyme. The background of this is made up of massive rocks, on which are planted numerous fine specimens, and among them the male and female Cedar, a grand specimen of Juniperus recurva, and another of Cunninghamia sinensis, with noble plants of Juniperus sinensis and Irish Yews. In the rockery is a shell grotto of curious and singular execution; numerous valuable specimens of conchology are arranged here with much taste and skill. In the centre of the grotto is a beautiful golden statue of Queen Eleanor. On the Grass banks on each side are groups of Juniperus hibernica, planted so as to represent minarets; and the foreground contains fine examples of Juniperus cracovia, lycia, tamariscifolia, and Sabina variegata, with Thuja filiformis, and Abies Clanbrasiliana. Santolina Chamæ Cyparissias and Lavender Cotton (Santolina squarrosa) spring out of the rocks, which are in places verdant with turf. In front stands a Deodar 25 feet high, whose branches, 3 feet in diameter, droop at the points, so as to represent a fountain. A beautiful view of Spondon Church, which is three miles distant, is obtained from the grotto, through an oval fissure in the rocks, the lake representing the foreground to the church. It may be stated here that this lake, with its towering rocky projections and Alpine decorations, was only begun to be formed in 1839. No portion of it whatever existed previous to that date.

Pursuing our course by the margin of the water, new prospects open on the view, and the south front is completely lost. Following this course, through masses of rock, which are left in the rear, we travel under covered Yew hedges, beside which stands a fine variegated Elm and rising above the Yew hedges, that are 15 feet high, are beautiful Minorca Hollies. We now come upon an extensive view of the lake, whose new forms rising in the distance are seen through an arch in the rock. On both sides are immense rocky formations, on which are groups of Pines and Junipers, with some fine plants of Taxodium distichum pendulum. We here lose the water entirely, and enter an American garden consisting of nearly 2 acres. The walks are of turf, 12 feet wide, with files of Irish Yews on each side, 6 feet high and 20 feet apart. Every sort of plant suitable for a garden of this kind is here, and among them many large specimens of the rarer Rhododendrons, as well as some huge plants of Andromeda floribunda and of Daphnes. We also remarked a noble Cupressus macrocarpa 10 feet high, and two Taxodium sempervirens of nearly similar height, all in perfect vigour and in fine foliage. Also associated with these there was a magnificent weeping Larch, 24 feet high and 3 feet in diameter, a perfect drooping column. After passing through the American ground, we shaped our course towards a bridge which crosses the lake at its narrowed point. The vista here, both east and west, is extensive and varied, with no appearance of a close. Bold promontories of various forms jut forward, while the water running behind them creates endless interest, and the enormous masses of rock, from 40 to 50 feet high, clothed occasionally to the summit with lofty Pines, give grandeur of expression. Across the bridge is a broad Grass walk, lined on each side with Irish Yews and backed with lofty plants of variegated Holly. Before proceeding far along this, we suddenly turn upon another view of the lake. Here we observed a beautiful Quercus Ilex var. Fordii, forming a column 25 feet high, this being its natural form of growth. This is a very handsome evergreen Oak, deserving of more extensive introduction into pleasure-grounds. Our direction now leaves the lake through scattered boulders of rocks, which rise in majestic grandeur out of the turf, and are backed with Hollies, Deodars, and red Cedars. The recesses are tufted with irregular masses of Lavender Cotton and Juniperus tamariscifolia, some of which hang naturally out of the fissures of the rocks. Farther on we come upon varied groups of Irish Junipers, the Lavender Cotton, and Tamarisk Juniper, scattered as before, until we reach the margin of the lake opposite the castle, which is partially seen through some fine old Cedars with horizontal branches, and a little to the left a tall weeping Ash 76 feet high. The north side of the lake, beyond the rocky masses, is backed by a considerable breadth of plantation occupying several acres, planted with large Deodars, Pinus macrocarpa, P. Sabiniana, P. Lambertiana, P. insignis, P. Cembra var. helvetica, Abies morinda, some of which are covered with cones, A. Douglasii, Picea Webbiana, and immense Yews, some of them upwards of 600 years old. All the above were transplanted in a large state. A rocky projection into the water at this point, we remarked, was planted with Spartium radiatum, Phlomis samia, Lavender Cotton, Juniperus recurva, variegated Savin, and Gold Yews. Turning to the left, we come upon a considerable breadth of lawn among the rocks, where are fine plants of Gold Hollies and Pinus Cembra var. helvetica. The rocks are here seen rising up behind them, covered with patches of Genista radiata, Spartium umbellatum, &c. Aralia japonica, 10 feet high, was in flower, and there were also plants of weeping variegated Box, Berberis buxifolia, Bupleurum fruticosum on the way side. The rock is here occasionally covered with Vinca major variegata in large masses. At this place we come abruptly upon a vast mass of rock about 50 feet high above the lake; an irregular rocky path leads to its summit, where a fine view of the castle, the church, and the rugged decorations of the water, with its bold involutions, is advantageously commanded. An island comes in here with good effect, covered with rocks and planted with Weeping Hollies, Juniperus excelsa, Yews, Pinasters, Douglas Firs, Pinus Cembra helvetica, variegated Spruce Fir; these, again, are relieved with high fastigiate Pines and Irish Yews, and the margin is covered with common Savin. On the mound from whence the view is obtained are large plants of Araucaria imbricata and Douglas Firs, 30 feet high, with cones on them; these are surrounded with Yews 100 years old, and large Cedars of Lebanon. On this mount we observed the following plants growing in great luxuriance in various recesses of the rocks: Juniperus Bermudiana, variegated evergreen Cypress, Colletia horrida, Hakea sp., Hydrangeas, Yucca gloriosa, Picea Webbiana, Amygdalus orientalis, Santolina Chamæ-Cyparissias, Cineraria maritima, Deodars, P. Cembra var. helvetica, Hemlock Spruce, Juniperus sinensis, Cotoneaster microphylla, Juniperus squamata, J. lycia, Aristotelia Macqui (variegated), Berberis empetrifolia and all the other obtainable species, Gaultheria Shallon, variegated Pinaster, and endless numbers of Alpine plants. From the plants growing on this mass of rock, some idea may be formed of its marvellous dimensions. *R. G.*

(*To be continued.*)

TRADE MEMORANDA.

Will any one be so good as to inform us who Messrs. H. T. Melson and Co., of "Stock Exchaing Chambers," Dale street, Liverpool, may be. Can they be Mr. John Handford?

Home Correspondence.

Descent of the Sap in Plants.—As you have invited your correspondents to state how far they agree with Professor Schleiden on the subject of the descent of the sap in plants, I venture to make a few remarks on this subject. It is now some 10 years since that whilst engaged in a series of experiments on the formation of wood, I found reason to doubt Du Petit Thouars' theory, on the ground that although in ringed trees there was a larger amount of woody matter around the lips of the upper portion of the wound, there was still a certain amount of growth of wood on the lower lips, which could not have taken place had the formation of wood depended on matter sent down from the leaves. I accounted for the greater quantity of the wood formed upon the upper lip of the wound, by the fact that in the upper part of the tree there was the greatest amount of the fluids of the plant, which obeying the ordinary laws of the diffusion of fluids and gravitation, would necessarily produce in this part either an exudation of fluid or a growth of tissue, according to the condition of the plant. That this was the case I found by ringing smaller branches, in which the fluid in the tissue below was as great as in that above the wound, and here the formation of woody matter and exudation of fluid was nearly equal. The objections to the theory of the formation of the wood by the leaves appear to me to be also fatal to the theory of a descent of the sap. The case of the Camellia mentioned in the *Gardeners' Chronicle* may, I think, be explained on the principle I have suggested above. An experiment confirming my view of the case may be performed upon a plant of common Spurge. If the stem is cut through, and the cut surfaces examined, it will be found that the lower one, presenting a surface for the exudation of the tissues in the root and a small portion of the stem, will afford much less of the peculiar milk of this plant than the upper cut surface; but if the smaller branches are cut, it will be found that the surfaces bleed just in proportion to the amount of tissue above or below the wound. The same experiment may be performed with the same results on the leaves. There has also always appeared to me a great difficulty in accounting for the ascent and descent of the sap through the petiole of the leaf. No one has succeeded in demonstrating the existence of a set of vessels in the petiole capable of carrying down the special secretions of the plant, in opposition to the constantly vigorous current of the ascending sap, passing into the blade of the leaf, in order to supply the great loss that is going on by evaporation from this part of the plant; nor are we acquainted with any cell-process by which the contents of one set of cells can be conveyed to that of others, except the common diffusion of the fluids of the plant, whose general tendency is towards the surfaces of the leaves where evaporation takes place, whether their relation to the whole stem is above or below it. It appears to me that it may be stated as a law in vegetable physiology that every vegetable secretion found in the cells of plants is formed directly from the assimilable matters—carbonic acid, water, and ammonia, or from soluble assimilated matters which can pass from cell to cell by the process of endosmose. To explain this law fully would take up far more space than you would be willing to admit in your columns; but as I understand it, it appears to me to explain all the facts on which the theory of the ascent and descent of the sap depends, and to contravene the axiom to which you draw attention in your Leading Article of Saturday last. This is a subject admitting a good deal of further illustration and experiment, and one to which the attention of persons having leisure and plants at command might be profitably directed. *Edwin Lankester.*

Continuous Blooming Roses.—I am preparing to give your readers a descriptive list of a few Roses which I have called continuous blooming; but in truth none can be more so than the two which may be seen in front of many hundred English cottages, and known as the common and crimson China. If the cultivators will but take the pains to remove the flowers as they fade, and prevent the seed-pods from swelling, they will not fail. I have been trying them on standards with varied success, because I have found that a frost which does not injure a plant on a wall or house front cuts off many of the young buds on the head of a standard. I have many standard Chinas of different varieties, and some called Noisettes, a score or two of which more or less partake of the character of the old China; but as they have been only bloomed one season, I am not satisfied that I have seen enough to justify a positive opinion. I will merely state that among the nearest approach to my desideratum, and at all events much longer in bloom than many others, I may mention first Noisette Fellenburg, flowering from the end of June to the end of November, in a strong clay soil, seven miles north of London. This is bright crimson, flowers double and small, joints short as the crimson China, and it has stood out three winters in a bleak situation, without protection of any kind, on ground but poorly drained. I will look over my notes, and give a few more, that even the first year of planting give promise of covering very close when fully established. I observe this Rose is noticed elsewhere, but all the florists together cannot say too much of it, and those who want a few cannot do better than order Fellenburg, and as many more as they require "of the same habit and season." *Crito.*

Salvia splendens.—My plan of growing this and other autumn flowering plants, including Chrysanthemums, is as follows: The cuttings are struck with the bedding out plants in spring, and receive similar treatment till planting out time, when those plants intended for decorating the conservatory in autumn and winter are planted in rows 3 feet apart, in a piece of fresh dug ground in the kitchen-garden that has not been very lately manured; they are watered and stopped as occasion requires until September, when they are carefully lifted and potted, and kept close for a few days in a pit, after which they are ready to take their places in the greenhouse or conservatory. *H. H.*

A Warning to all who have Aviaries; showing the Extreme Voracity and Astute Cunning of the English Rat.—I have very frequently read in your columns remarks on the best and most effectual means of getting rid of these atrocious vermin; but as I have not myself been personally interested at the time in their destruction, I have only become theoretically acquainted with the subject in its general bearings. I am now about to crave the kind aid and advice of yourself and correspondents on a matter, to me, of vital import, and shall then be prepared to combine practice with theory; the result shall assuredly be made known *pro bono publico*. But to my grievance. For the last 20 years I have been an amateur or "fancier" of song birds; and many little anecdotes connected with their personal history have appeared in your Paper during the last few years. I built my birds, at starting, a large commodious aviary, and fitted it up in a style worthy of its inhabitants, the *agréemens* of well polished looking and toilet-glasses, everlasting fountains and leafy foliage not being wanting to render their house an "ornithological palace." My collection has been noted as one of the most select of its kind extant, comprising nightingales and other foreign song birds, and including specimens of nearly every chorister of the English woods and forests. The extreme number of birds my aviary has contained at one and the same time has been 366; it having been my "weak point" to boast of having more birds in my possession "than there were days in a year." (Alas! I cannot say so now!) Built as it is on a most picturesque spot, and arched over by a number of lofty Fir trees, growing immediately in its rear (in Ravenscourt Park), Nature and Art have vied with each other to render the *personnel* of my aviary unexceptionably beautiful. I have been thus explicit, with the view to place my yet unexplained grievance in a strong light. I say grievance, for the aviary is now completely dismantled, my birds are reduced to the number of 11 only, (what a descent from poetry to prose!) and these, confined in wire cages, are kept simply as mementoes of what they once were. "*Troja fuit!*" Now I trace all my misery to an army of rats, which, since the heavy rains of autumn, have quitted their usual haunts, and unceremoniously "billeted" themselves upon me. These murderers first made their appearance at night, through holes eaten in various parts of the floor, and every morning I as carefully nailed over the said holes flattened pieces of zinc; this, for a night or two, kept the marauders at bay. However they very soon reappeared, until at last my flooring was almost completely "tesselated" with zinc. Not imagining for some time that they came to prey upon the birds, I placed poisoned food in their runs; also "Harrison's Pills," &c., as strongly recommended by your correspondents. All these, however, remained untouched, and the frightful diminution of my feathered friends, now apparent day by day, soon convinced me of the awful extent of my misfortune. The climax is soon reached. On opening the aviary door one morning, about a fortnight since, a scene of devastation presented itself which I will not, indeed cannot, attempt to describe. Suffice it to say, my eye fell instinctively on a large hole in the centre of the floor, which had been gnawed through an immensely thick protective piece of wood, and on counting the number of inmates I found them just 11!* To remove these, and in a fit of desperation to convert their late habitation into a greenhouse was the work of a short half hour; and thus "my tale is told." The cunning of these rats has been immense. They must have carried on their operations of gnawing while mounted one on the back of another (a system of theirs I have before now heard of), for the flooring is laid on wooden sleepers, and the distance from the ground below to the flooring above is at least 8 inches. To exterminate these monsters is my full determination, and I shall anxiously look for instructions from you as to my best mode of procedure; the more especially, when I add that I have in the immediate vicinity of the aviary nearly 100 head of poultry, many of them the choicest gold-spangled bantam breed of the late Sir John Sebright, and the finest specimens of the gold-spangled Hamburghs. I am told by a knowing neighbour, by way of comfort, that I may fully expect some morning to find the entrails of some of these torn out by the rats. What a prospect! *Wm. Kidd, Sanders' Cottage, New-road, Hammersmith, Jan.* 1.

Wooden Shutters v. *Garden Mats.*—I have often thought that wooden shutters on frames would form better protectors than mats, and I have reasoned in this way—Why should not wooden frames do as well as glass? for many, nay the majority of things that only want protection from frost, or excessive wet, are best wholly exposed, when there is no frost; and when there is, I judge light is not wanted. I have had a fire burning for three weeks to start my earlier Vines, and now, in the fourth week, the buds are just breaking. Why should not the house be covered with wooden frames till there is some appearance of the buds breaking? What a saving of fuel and labour, by day and night, would these shutters occasion! In the case of heavy rain, too, they could be pulled down over the border. Considering the many uses they might be put to—where, as the day lengthens, they might interfere with the early dawn of light, I think they will be found both invaluable and cheap. *J. L., Deptford.*

Harmony of Colours: Paint for Inside of Greenhouses.—I have read with much interest your observations on the effect of contrasted colours, to which I would suggest a practical corollary—viz: that the appearance of plants in a greeenhouse or conservatory is greatly enhanced by a judicious tinting of the woodwork. I was led to this conclusion some time since by observing that almost all flowers appeared to peculiar advantage in a room whose walls are painted a very light yellow-green; and, acting upon this suggestion, I have had the interior of my greenhouse painted, as nearly as possible, the same colour, with excellent effect. The colour in question is a few shades greener than the yellow-green of the Primrose flower; in fact, a colour midway between the fresh leaf of the Primrose and its flower, is about the right tint. I find that the yellow generally used by painters fades so that a slight excess of yellow at first is not objectionable. It is important that the tint should be a warm yellow-green, not grey or blue-green, which last is very objectionable. If the outside of the house be painted black, the effect from without also is improved. It is curious to notice on removing a plant (say for example Leschenaultia formosa) from a house tinted stone-colour to one tinted green, how much more brilliant its colours appear; so much so, as really to give an appearance of improved health to the plant. Should any of your readers adopt my suggestion, I recommend them to see that the green is not deadened with black, a favourite practice with painters. The green and the yellow must both be pure colours, mixed with white-lead only; and allowance should be made for a tendency in the yellow to fade. *J. R., Sevenoaks.*

Sulphured Rags v. *Hares.*—I have proved that the plan recommended by "S.," of keeping hares from barking trees is utterly useless, and it is possible that he, having had an additional "few days' experience," has discovered the same thing. Many of the washes recommended for this purpose are also failures. I wish you could prevail upon those who recommend the adoption of any principle, system, or plan, to state their failures when they have found that they have too hastily formed opinions, and arrived at conclusions which were not warranted by their further experience. I do not allude particularly to this case, or to any other case, but I speak in a general way. *Henry C. Ogle, gardener to the Earl of Abergavenny, Tunbridge Wells.*

Destruction of Vermin.—My gardener has just given me an account of the vermin he destroyed in my garden in the year 1849, which is as follows: Birds shot—12 bullfinches, 331 sparrows, 99 blackbirds and thrushes. Caught in Traps—233 tom-tits, 62 mice. Picked up and destroyed—23,802 snails. Caught in a Net, Dec. 11, 1849—46 green linnets, 44 sparrows, 10 pied-finches, 2 blackbirds; total, 102. *A. A.* [A fine time the insects will have of it now.]

* The cunning of the animal is more remarkably seen in the fact of his disappearing with his prey bodily through the aperture in the floor, thus leaving no feathers behind him, but commencing his meal in a neighbouring garden, wherein I have just heard that wings and feathers have been repeatedly found. The rats, no doubt, mounted the poles and caught the poor birds while sleeping in imagined happy security on their perches. This proves that the flooring of all aviaries should be under-cased with zinc.

Societies.

CALEDONIAN HORTICULTURAL (Annual winter meeting.)—On this occasion the office-bearers for 1850 were elected, and seven new members added to the roll. A report from the Committee of Prizes was received and approved of. For the best three sorts of Pears, fit for dessert, and exclusive of Marie Louise, there were three competitors. A 1st prize was awarded to Mr. Morrison, gr. to R. Ainslie, Esq., for Chaumontelle, Gansell's Bergamot, and Crassane; and a second premium to Mr. Baxter, gr. to Sir J. G. Craig, Bart., for Beurré Rance, Easter Beurré, and Winter Nelis. For the best four Marie Louise Pears the prize was awarded to Mr. Morrison. For the best six kinds of table Apples there were four competitors. A 1st prize was assigned to Mr. Calder, gr. to Lady Harris, for Seacliff Apple, Gravenstein, Borsdorffer, Ribston Pippin, King of Pippins, and Old Nonpareil; a second Premium was voted to Mr. Morrison, for Cellini, scarlet Nonpareil, Paradise Pippin, Ribston Pippin, Melville Pippin, and Cephalonia; and a third to Mr. M'Donald, gr., Drummond Castle. For the 12 finest flowered single clusters of Chinese Chrysanthemums, there were four competitors. A 1st prize was awarded to Mr. Young, gr. to Mrs. H. N. Ferguson, the kinds being Minerva, Duc de Nemours, General Moreau, Salter's Annie, Queen of Yellows, Princess Maria, Clustered Yellow, Marquess, Queen Victoria, Bicolor, Queen, and Comte de Rutyen. A second premium was voted to Mr. Mitchell, gr. to Lady Keith, for Queen, Temple of Solomon, Plaratum, Celestial, Manama, Victoria, Salter's Annie, Etilla, Frigene, Princess Maria, Antoinette, and Nancy de Lirmet. [We print these names as we received them; but they seem most barbarous and unlike reality.] For the four most dwarf and finest-flowered plants of Chinese Chrysanthemums, the prize was awarded to Mr. Sleigh, gr. to the Lord Advocate, the kinds being Bicolor, Queen, Mirabile, and David. For the best two heads of German Greens there were eight competitors. A 1st prize was awarded to Mr. Mitchell, for Alder's fine dwarf; and a 2d to Mr. Johnston, market gardener, Braidburn. For the premium offered for the best four Leeks, there were no fewer than 12 competitors, all of whom produced large and well blanched specimens. The 1st prize was gained by Mr. Blair, gr. to J. C. Renton, Esq, M.P., the kind being Scotch Flag; and a 2d premium was voted to Mr. Pousty, gr. to W. M. Innes, Esq. For the best four stalks of solid Celery, two red and two white, there were eight competitors. A 1st prize was awarded to Mr. Sinclair, gr., Tullichewan Castle, for Seymour's Matchless Red and Seymour's Superb White; and a 2d premium to Mr. Henderson, gr. to C. K. Sivewright, Esq., the kinds being Sutton's Superb White, and Cole's Dwarf Red. For the best three sorts of Onions there were seven competitors, the bulbs being in general large and fine in quality. A 1st prize was awarded to Mr. Morrison for Deptford, James' Keeping, and Blood-red; a 2d premium was voted to Mr. Allan, gr., Seapark, for James' Keeping, Reading, and Strasburgh (raised by him at Duffus House); and a 3d was assigned to Mr. Pousty. For the best four specimens of Red Beet there were eight competitors. A 1st prize was awarded to Mr. King, gr. to A. Campbell, Esq., for Wyatt's variety; and a 2d premium was voted to Mr. Reid, Edmonston Gardens. For the prize of Two Guineas, offered by Messrs. Lawson and Son, for the best collection of Dried Specimens of Hardy Perennial Herbaceous Plants, two collections were sent. The prize was awarded to Mr. J. Jeffrey, Royal Botanic Garden, Edinburgh, his collection containing 1692 species and varieties, arranged according to the Natural System of De Candolle. The silver medal was voted by the Society, as 2d prize, to Mr. A. Jaffrey, Experimental Garden, whose collection consisted of 1045 species and varieties, likewise arranged according to the Natural System. It also contained several sheets of carefully executed dissections of the parts of the flower. In competition for the silver medal, offered by the Society, for the best collection of British plants, including Filices, four competitors appeared. The medal was awarded to Mr. M'Hattie, Royal Botanic Garden, whose hortus siccus included 570 species, correctly named, and arranged according to the Natural System. A 2d prize, with certificate of merit, was voted to Mr. Pender, Barnton, for a collection containing 363 species, arranged according to the system of Linnæus. An additional award, with certificate of merit, was granted to Mr. Syme, Blairhill, who produced a collection consisting of 102 species correctly named. Amongst articles for exhibition only were a collection of fruits from Dalkeith Palace Garden, including two Pine-apples, and 50 varieties of Apples proved and named at Dalkeith, for which the Society's silver medal was voted to Mr. M'Intosh; from Mr. Baxter, Riccarton, four fine bunches of retarded Grapes, one of which, named Abercairney Seedling, was particularly pointed out as a good winter Grape, also Beurré Rance Pears from root-pruned trees; from Mr. Addison, Gosford, three fine seedling Chinese Primulas, for one of which, a cross between the rose and white varieties, a certificate of merit was granted; from Mr. Young, Archerfield, a box of fine named Chrysanthemum flowers; a beautiful bouquet from Canaan House; Chrysanthemums from Mr. Reid, Edmonston House; fine Alfriston Apples (from a standard tree) from Mr. Lauder, Goshen; a dish of very fine Mushrooms from Mr. Pender, Moredun; and from Mr. Lyall, gr., Pinkie House, fine forced Rhubarb stalks. J. Mitchell, Esq., Leith, exhibited specimens of a free fruiting variety of Bryonia dioica, grown by him in the open air at Mayville, from seeds collected by him at Ribe, on the west coast of Schleswig. The specimens were covered with beautiful berries, in various states of maturity, red, orange, yellow, and green; and it was stated that the plant grows rapidly, and proves highly ornamental for trellises or verandahs. Mr. Blair, Mordington House, exhibited six varieties of seedling Potatoes raised from American seeds, and these were ordered to be tried in the Society's garden. Mr. Anderson, Linkfield, exhibited some fine Carrots from a field near Aberlady, and stated that the produce was equal to 32 tons per acre.

Reviews.

The Physical Atlas of Natural Phenomena. By Alex. Keith Johnson, F.R.G.S. (Reduced from the edition in imperial folio.) 4to. Blackwood. 1850.

THIS admirable work is thus spoken of in the last edition of Mrs. Somerville's "Physical Geography:"

"The author avails herself, with much pleasure, of an opportunity of expressing her admiration of the accuracy, extent, and execution of Mr. Keith Johnston's 'Physical Atlas,' and of the valuable information contained in the letter-press which accompanies it, which has afforded her the greatest assistance. It was the author's wish, and her publisher's intention, that the present edition should be accompanied by a series of maps to illustrate the more important questions of physical geography treated of in it; but Mr. A. Keith Johnston having announced the publication of a new edition of his 'Physical Atlas,' in a reduced size at a low price—the first two numbers of which have already appeared—the project was relinquished, in the belief that Mr. A. K. Johnston's smaller Atlas will furnish suitable illustrations to this work."

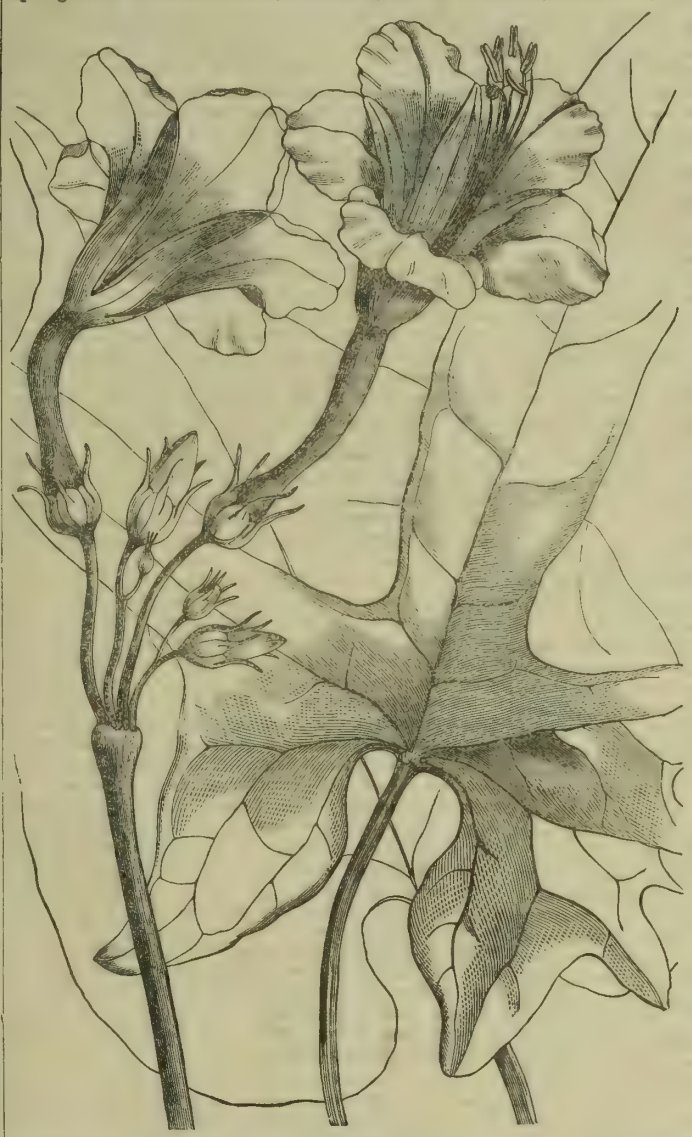
That belief has not been belied. The work alluded to is now before us, and proves to be one deserving of the

highest commendation for "its accuracy, extent, and execution."

The object is to show, by means of lines and colours traced over maps of various parts of the world, the great facts belonging to climate, geological formations, and the distribution of living things upon the surface of the earth. For instance, in one map we have a representation of the mountain chains of America; in another, the geological structure of the globe; in two others, a striking delineation of the amount of rain which falls over the world in general, and Europe in particular, and so on. A series of nine maps shows the geographical distribution of plants, animals, and human beings. In all there are 24 of these representations, engraved and coloured with the greatest neatness and accuracy, and with an amount of detail which is extraordinary, considering the small size of the pages.

The maps themselves are explained and illustrated by a great quantity of well-arranged letter-press, embodying and classifying all the more important facts which are known to natural philosophers.

Of all these maps the most interesting to us is that which shows at a glance "the distribution and cultivation of the most important plants which are used as food for man." Could such a map be suspended in the meeting room of farmers' clubs and gardeners' reading rooms, we should soon cease to have our patience abused by idle speculations about growing Maize and Tobacco in England, or Cotton and Yams in Ireland, or making wine in either country. We wish it were in our power to illustrate this by an example, but the form and nature of the book are not susceptible of being transferred to the pages of a newspaper, and therefore we must content ourselves with recommending Mr. Johnson's Atlas strongly to all who are interested in the subjects of which it treats.



Genera Floræ Americæ boreali orientalis illustrata. The Genera of the Plants of the United States, illustrated by Figures and Analyses from Nature; by Isaac Sprague. Superintended by Asa Gray, M.D. Vol. II., plates 101—186. 8vo. Putnam, New York and London.

At p. 7, of the *Chronicle* for 1849, we gave our opinion of the first volume of this important work, which is destined to do more for the student of the systematical botany of the United States than any book which has yet appeared. The first volume was well done, and richly deserved the commendation it received at our hands; the present is yet better, and merits a still kinder report. Like other artists, Mr. Sprague improves his hand with practice; and the knowledge of Dr. Asa Gray is an exhaustible mine of useful technical observations. Some of the plates are equal to anything of the kind produced in Europe; those of Mallowworts in particular will, we trust, meet the eye of Professor Schleiden, and assist in changing his views of the true structure of such plants.

Dr. Gray's remarks upon the genera of this family are among the most novel and striking in the volume. We can only wonder that he should not have seen the unsoundness of the French doctrine of deduplication, instead of unreservedly accepting it, on the faith of M. Duchartre's interpretation of the progress of development. We would also express our doubt of the propriety of following Mr. Bennett in separating the spurious genus Frangula from Rhamnus, upon verbal rather than substantial differences. These are, however, slight blemishes, and in no way detract from the character of the work, which promises to become one of which the United States may well be proud; for none of the states of Europe will have produced its equal, when it is completed.

Miscellaneous.

Calboa globosa.—A rambling perennial, raised from seeds received from Mr. Hartweg in January 1846, and said to have been collected on the eastern declivity of Orizaba, in Mexico. It is smooth in every part. The leaves are thin, dull green, on long stalks, and extremely variable in form; some are cordate and acuminate; others sagittate; others completely hastate, with the lobes all narrow, and the lower ones deeply angular. The flowers grow in naked umbels, on a peduncle 9 or 10 inches long; the pedicels are from 1½ to 4 inches long. Each sepal has a long subulate process at the back. The corolla is 2½ inches long, deep rich red, with a curved cylindrical tube, and a campanulate erect limb, divided into five erect rounded wavy lobes. The stamens are declinate, and longer than the corolla. This very curious plant, of which the annexed woodcut is a representation, was referred to Quamoclit by Mr. Bentham, but it appears to be perfectly distinct from that genus in its declinate stamens, and curved corolla, with a great campanulate inflated limb. Whether or not there may be more than one species is somewhat uncertain. The Calboa vitifolia of Cavanilles, from St. Blas in California, is figured by that author with five long distinct reflexed segments to its corolla, which is said to be yellow on the outside, and purplish red in the inside. If so, it must be distinct from this. The plant in the Society's garden is undistinguishable from the Guatemala specimens brought home by Hartweg, and yet it was raised from Mexican seeds. This gives rise to a suspicion that Cavanilles' account is not to be trusted, and that there may be only one species; if so, it will bear the name of C. vitifolia. A strong half-woody climber, growing freely in any good rich soil composed of loam and sandy peat. It is easily increased by cuttings of the young shoots, and requires to be kept rather dry in a cool part of the stove during the winter, but should be grown in a cool airy part of the greenhouse during summer, where it will flower from August to October. Although undoubtedly a fine species, it is only fit for growing where there is plenty of room for its tops to spread. It will not flower in a pot, and must therefore be planted in the open ground. *Horticul. Society's Journal, Jan.* 1, 1850.

Chinese Method of Colouring Green Tea.—During a visit which I paid to a tea manufactory in the city of Shanghae I happened to meet some merchants who came from the celebrated green tea district of Wheychou. They would not acknowledge that any colouring matter was used in the manufacture of their teas, and pretended to laugh at the idea of such a thing. They said, moreover, that they were aware the practice of colouring was a common one about Canton, where inferior teas were made, but that they never coloured their teas in Wheychou. It is, however, a difficult thing to get the truth out of a Chinaman; and from information which I had received I knew quite well that our Wheychou friends were deceiving us in the present instance. Shortly afterwards I had an opportunity of seeing the whole process; and as it is one of considerable interest, I noted it down at the time with great care, and now send you a copy of my observations. The superintendent of the tea makers managed the colouring part of the business himself. In the first place he procured a portion of indigo which he threw into a porcelain bowl, not unlike a chemist's mortar, and crushed it into a fine powder. He then burned a quantity of gypsum in the charcoal fires which were roasting the tea. The object of this was to soften the gypsum, in order that it might easily be pounded into a fine powder in the same manner as the indigo had been. When taken from the fire it readily crumbled down and was reduced to powder in the mortar. These two substances having been thus prepared were then mixed up in the proportion of four parts gypsum to three of indigo, and together formed a light blue powder which in this state was ready for use. This colouring matter was applied to the tea during the last process of roasting. The Chinese manufacturer having no watch to guide him, uses a joss stick to regulate his movements with regard to time. He knows exactly how long the joss stick burns, and it of course answers the purpose of a watch. About five minutes before the tea was taken out of the pans, the superintendent took a small porcelain spoon and lifted out a portion of the colouring matter from the basin and scattered it over the tea in the first pan; he did the same to the whole, and the workmen turned the leaves rapidly round with their hands, in order that the colour might be well diffused. During this part of the operation the hands of the men at the pans were quite blue. I could not help thinking that if any drinker of green tea had been present during this part of the process his taste would have been corrected—and I hope I may be allowed to add, improved. It seemed perfectly ridiculous that a civilised people should prefer these dyed teas to those of a natural green. No wonder that the Chinese consider the nations of the west as "barbarians." One day Mr. Shaw, a merchant in Shanghae, asked the Wheychou Chinamen their reasons for dyeing their teas: they quietly replied that as foreigners always paid a higher price for such teas, they of course preferred them, and that such being the case the Chinese manufacturer could have no objection to supply them! I took some trouble to ascertain precisely the quantity of colouring matter used in the process of dyeing green teas; certainly not with the view of assisting others, either at home or abroad, in the art of colouring, but simply to show green tea drinkers in England, and more particularly in the United States of America—what quantity of gypsum and indigo they eat or drink in the course of a year. To 14⅓ lbs. of tea were applied rather more than an ounce of colouring matter. For every 100 lbs. of green tea which are consumed in England or America, the consumer really eats more than half a pound of gypsum and indigo and I have little doubt that in many instances Prussian blue is substituted for indigo. And yet, tell these green tea drinkers that the Chinese eat dogs, cats, and rats, and they will hold up their hands in amazement, and pity the taste of the poor celestials. In five minutes from the time of the colour being thrown into the pan the desired effect was produced. Before the tea was removed the superintendent took a tray and placed a handful from each pan upon it. These he examined at the window to see if they were uniform in colour; and if the examination was satisfactory he gave the order to remove the tea from the pans, and the process was complete. It sometimes happened that there was a slight difference amongst the samples, and in that case it was necessary to add more colour, and consequently keep the tea a little longer in the pans. *R. F., in the Athenæum.*

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

If the ground in any portion of the kitchen-garden or pleasure-ground indicates a want of better drainage, this is an excellent time for remedying the evil, as there is greater leisure for improvements at this season; and as the surface is not so fully occupied, any disturbance of it is not so objectionable. If the subsoil consists of stiff clay it is very easy to excavate it, now that it is thoroughly moistened. The depth of the drains and the distance apart must depend entirely upon the nature of the soil; but whatever the latter may be, the draining should be very liberally done, as it is of paramount importance that the water should percolate through the soil freely and quickly, for the sake of the crops in the kitchen-garden, and to render the pleasure-ground more enjoyable. It may happen in many instances that the ground has been drained at some former period, but that such drainage has not been perfectly effective; in cases of this kind the existing drains should be first examined, and if they are in good working order they show the necessity of deeper drains, so that the water may be drawn off to a lower level. Let all the drains, and especially the main receivers, be kept as far as possible from trees, as they are liable to be choked up by their roots.

PLANT DEPARTMENT.

General Plant Houses.—Euphorbias, Poinsettias, &c., which have done flowering, will now require less heat and moisture, that they may be ripened gradually off, and have about three months rest before they are again started into growth. It is not worth while to retain more of the old plants than will be required for large specimens, as young plants are easily propagated, and, if well grown, make nicer plants than the old ones, and, by discarding the latter, you get room for other things. You will at this time decide what plants you intend to make specimens of, and in doing so, be very careful not to keep more than you have proper room for. It is often considered a good fault to have too many; but, with regard to plant growing, this is a decided mistake, and it is much better to determine what you have not room for at once, than to have your pets smothering each other in a few months' time, and

so making it necessary to throw them away, and along with them all the trouble and care which you have bestowed upon them during that period. Cuttings of the most useful plants you throw away should first be secured, and placed under congenial circumstances in a propagating pit, to form flowering plants for next autumn and winter. Poinsettias and Euphorbias should be struck in pots of damp white sand, and placed for a few weeks in a cool dry place, where the temperature is never lower than 40°. When the bases of the cuttings are cicatrised, they may be plunged in a moist bottom heat. So treated, they will soon make both leaves and roots in abundance. When it is desirable to have very large specimens of these showy winter-flowering plants, let them be pruned to within an eye or two of the two-year-old wood, and place them in a dry cool part of the stove, till they begin to break of their own accord, when they must be removed to a situation where they will have an abundant supply of heat and moisture. A portion of your stock of Achimenes, Gloxinias, and other summer flowering bulbs, should now be started. A suitable compost for these plants, consists of one-third rich mellow turfy loam, one-third leaf-mould, and the remaining portion of pigeons' dung, sand, and charcoal. Whenever pigeons' dung or other rich manure is used, it should be very finely comminuted, by rubbing it through the hands along with the sand, before it is incorporated with the other ingredients. Achimenes should be started in their old soil, and parted when the young growths are about an inch long. Plants of this family delight in a moist bottom heat, with a moderate top heat, that the roots may be kept in advance of the tops. When potted, they should be placed at once in the pots in which they are to flower.

FORCING DEPARTMENT.

If a stock of leaves for fermenting is not already procured, it should have immediate attention; they should be gathered as dry as possible, and stowed away in open sheds. If they are not quite dry when collected, they should be spread out thinly on the floor of these sheds, to prevent fermentation taking place until it can be usefully employed. Where such conveniences are not already in existence, they may soon be erected, as they are very inexpensive. The roof should be supported by pillars of Oak or Fir, with one side open, and the back and ends closed in with rough slabs; the roof may be thatched in the ordinary way. These, of course, will find their place in the "back grounds;" but although cheaply constructed, they, and everything else about the same quarter, may and should be kept perfectly tidy. The same remarks will apply to tan, which should be kept as dry as possible until wanted for use. By keeping a stock of all kinds of materials ready for use, a much greater amount of work may be done, and a greater effect produced, with the same apparent means, as you are enabled thereby to proceed systematically in all your operations. PEACH-HOUSE.—Outside roots should be protected by a straw thatch, which should throw the wet off into the drain in front of the border. If the buds are just swelling, maintain a temperature of about 50° by night, and sprinkle the trees several times a day in clear sunny weather. STRAWBERRIES.—Select some of the strongest best-rooted plants, and after examining the drainage and ascertaining that it is in an efficient state, they should be top-dressed with a mixture of loam, well rotted dung, and fine charcoal, and plunged close to the glass in a mild bottom-heat, say 65°, with top-heat, 45° to 50°. MELONS.—Seed of some approved early kind should now be sown, and a bed prepared.

FLOWER GARDEN AND SHRUBBERIES.

Active preparations should now be made for propagating, by getting pits, frames, soil, and pots ready. In taking cuttings off bedding plants, a little care in correctly naming and distinguishing the different kinds will be well spent. It is very tantalising to find the harmonious arrangement of your colours destroyed, for want of a little more care on the part of your propagator. When the weather permits, let any alterations in the ground which have been decided upon, be persevered in with all possible despatch; keeping always in mind, that success depends upon the careful manner in which every operation is performed. These remarks more particularly apply to the formation of the ground, the preparation of the soil, and the taking up and replanting of choice shrubs. If not done already, cuttings should be put in immediately of many hardy shrubs, as the Jasmine, flowering Currants, Honeysuckle, &c. Look sharp after the beds of Crocus and other spring-flowering bulbs, as mice are very apt to attack them. We use the common figure 4 trap, baited with anything that mice are fond of, and find it answer the desired end.

FLORISTS' FLOWERS.

The continuous frost up to this day, Thursday, suspends all floricultural operations. In addition to preparation of composts, &c., recommended last week, there are many things connected with the fancy which will occupy the amateur's leisure hours. Formerly when we wanted to layer our Carnations we were wont to have a day upon some moor getting pegs or hooks of the fronds of the Fern or Braken; we now have some thousands of leaden ones, ready cast, and though these may have been put by uncleaned as well as not straightened, when we potted off our layers, we now find it a good opportunity to look them over and make them ready for the next season. Then there are perhaps some hand-glasses which want repairing, Carnation sticks cleaning, re-painting, and storing away till wanted. At this period when there is little else to be got, and frames are kept much closed, mice are apt to commit serious depredations, especially amongst Polyanthuses kept in pots. On the first symptoms of their handy-work traps should be set, for we have known several pounds worth of damage done to an extensive collection during a prolonged frost. When the frost breaks up, one of the first things required will be to look over the beds of seedling flowers, and to press the plants down, and, at the same time, examine all labels and pegs, as these as well as plants are apt to be raised by the frost. Auriculas may be watered, should the weather prove mild, not a few spoonfuls on the surface, which may not penetrate a quarter of an inch, but a soak, so that the soil may be thoroughly moistened; abundance of air must at the same time be given.

HARDY FRUIT GARDEN.

Scions for grafting, of choice fruit trees, should be secured, and laid in under a north wall. In selecting these make choice only of those varieties which have been proved by experience to be well adapted to the locality. There are many varieties which do admirably in one county, but are worthless in another. In purchasing new kinds, the above reason makes it advisable not to procure too many plants of any one variety till its applicability to the soil and situation has been tested. By procuring root-pruned plants on Quince stocks this may be easily managed in a couple of seasons. Planting of fruit trees should be proceeded with. It is well to be at some little pains in preparing the ground for the reception of Pears and other choice fruits. If the soil be deep and retentive, a stratum of ashes, or some similar substance, should be laid within 9 inches of the surface, to check the downward tendency of the roots. Loam from an old pasture, without manure, forms the best soil for the healthy and fruitful development of the Pear tree.

KITCHEN GARDEN.

CUCUMBERS.—These must have careful attention at this dull season. By a proper arrangement of the ventilators a constant circulation of the air should be secured, and the portion of fresh air which is admitted from the outside should, if possible, be made to pass over the warm surface of the flues or pipes before it comes in contact with the plants. Upon a proper attention to this point the health of the foliage and the setting of the fruit very much depend. A high night temperature and a scalding evaporation is very injurious. A crop of some early kind of Peas and Early Mazagan Beans should be sown as soon as the ground is dry; and if carefully attended to, by mulching with old tan when up, and by protecting with Fir boughs on the windward side, they will generally produce a better crop than if sown in November, and, unless in very favourable localities, they will be quite as early. In sowing vegetable seeds, which are liable to be attacked by the mice, it will be found useful to sow chopped Furze or malt screenings in the drills. ROOT HOUSE.—Take advantage of wet weather to examine and remove any decayed or decaying roots. Adopt efficient measures for keeping the frost out.

State of the Weather near London, for the week ending Jan. 10, 1850, as observed at the Horticultural Garden, Chiswick.

Jan.	Moon's Age.	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean	Wind.	Rain.

The highest temperature during the above period occurred on the 19th 1828—therm. 60 deg.; and the lowest on the 19th, 1838—therm. 4½ deg. below zero.

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE: The publisher begs to say that the following may be had. Any subscriber who will forward postage stamps equivalent to as many numbers as are required, will have them sent free by post. The volume for 1847, price 30*s.*, and volume for 1848, price 30*s.* 6*d.*, can still be had. The volume for 1849 is now ready, price 30*s.* The volumes of former years are out of print.

1841—1, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 45, 46, 47, 48, 51.

1842—4, 6, 8, 11, 12, 16, 18, 20, 31, 32, 34, 39, 41, 42, 45, 49, 50, 51, 52, 53.

1843—13, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 38, 40, 41, 42, 43, 48.

1844—1, 2, 3, 4, 5, 6, 7, 8, 9, 10 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 48, 49, 51, 52.

1845—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19, 20, 21, 23, 25, 27, 28, 31, 33, 39, 40, 41, 44, 45, 50, 51, 52.

1846—4, 5, 6, 7, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 26, 42, 43, 46, 47, 48, 49, 50, 51, 52.

1847—1, 2, 3, 4, 5, 6, 7, 8, 10, 11, 13, 14, 15, 19, 21, 22, 23, 27, 32, 33, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 51, 52.

1848—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 30, 33, 34, 36, 37, 39, 40, 41, 44, 45, 51, 52, 53.

1849—All except 49.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

APPLES: *X Y.* Very like the Fenouillet Gris.‖—*E B.* Your seedling from a Ribston pip is a sad degeneration, unworthy of a name.‖

BLUE-BELLS: *P Y.* One is the bulb and the other the underground runner which produces the bulb.

BOOKS: *C.* The "Vegetable Kingdom" was a new edition of the "Introduction to the Natural System;" the "Introduction to Botany" is a different work. The "Elements of Botany" now consist of the Elements, the Glossary, and Medical and Œconomical Botany; the last completing that work. You should procure these works in addition.—*Fucus.* We know nothing of the chart you speak of. Consult Mr. Keith Johnson's beautiful and cheap Atlas. There is no book comparable to Euclid.—*T G H.* We have seen no more of the work you mention than is noticed at p. 719 of our volume for 1848.‡

CELERY: *F H S.* We never recommend dealers.

CHICORY: *J Stokes.* It is not the same thing as Dandelion; the medicinal properties of Chicory may be similar to those of Dandelion, but they are not the same.

CONIFERS: *H.* Juniperus thurifera is a native of Spain and Portugal, where it grows 20 feet high; it is known in some collections by Miller's old name of Juniperus hispanica, or Spanish Juniper. Cupressus thurifera is a native of Mexico, where it attains a height of 50 or 60 feet; C. Coulteri is the same thing. Juniperus macrocarpa is a native of Greece, where its height is from 10 to 12 feet; it has large purple berries, and open sharp-pointed leaves. Cupressus macrocarpa is a native of the Californian mountains, and attains a height of from 50 to 60 feet, and when old has a flat spreading head, very like an old Cedar of Lebanon. Juniperus taurica, as its name implies, is a native of the mountains of the Crimea; it resembles the common brown-berried Juniper (J. oxycedrus) of Spain and Portugal, of which it seems nothing but a variety, with rather larger and greener foliage. J. daürica is the same as, or only a very slight variety of, the common dwarf Juniper (J. nana).¶

EVERGREEN SHRUBS FOR SHADY PLACES: *Oswald.* Berberis Aquifolium, tree Box, Hollies, Laurels, Privets, and amongst them Periwinkle; but nothing will grow very well within the reach of Elm roots. Put the plants as near the Elms as you can.

INSECTS: *R R.* The insects found in the crevices of your old Peach tree wall are the bark mite described in our volume for 1843, p. 356. We do not think them injurious except where

excessively numerous, or to very young trees. We would, however, advise you to repoint your wall or face it with cement, and use iron parallel rods to fasten the branches to, instead of nails and shreds. 1 shows the minute insects congregated round the base of the branch, after they have left their winter quarters; 2 is one magnified. *W.*

NAMES OF PLANTS: *J K.* Oncidium Barkeri, Catasetum maculatum, Lycaste plana.—*Hybrid.* Aponogeton distachyon, quite hardy.—*P B.* 1, L. anceps; 2, L. a. Barkeriana; 3 and 6, varieties of L. furfuracea; 4, L. autumnalis; 5, apparently a form of L. furfuracea, but perhaps distinct (all these scurfy stalked Lælias require to be studied carefully); 7, L. peduncularis, a pale var.; 8, L. erubescens; 9, Epidendrum paniculatum.—*M A G.* We do not recognise the plant; and its flowers, very young, and male only, do not enable us to determine it.

ROSES: *Northumbriensis.* We have not before seen any question from you. The best answer to your inquiry is perhaps in the following extracts from Mr. Rivers's excellent "Rose Amateur's Guide." Of Hybrid Perpetuals he speaks thus, "All the robust-growing varieties of this family form admirable standards, and are particularly well adapted for planting in rows by the sides of walks, giving them plenty of manure, and the necessary culture required by these Roses—removing a portion of their bloom buds in June; thus, if there are 10 clusters of bloom making their appearance, cut off five to within about three buds of the base of each shoot; these will soon push forth, and give fine flowers in August. Constant care should be taken to remove in the same manner all the clusters of blooms as soon as they fade. Louis Bonaparte, and a few others, are very apt to make barren shoots without terminal flowers. As soon as this can be ascertained, cut all such shoots to within six or eight buds of their base; they will then, in most cases, give fertile branches; in short, these Roses require much summer pruning and attention to make them flower in great perfection in autumn." Of Bourbons thus, "These Roses require but little pruning; towards the end of March or beginning of April their shoots may be thinned, those that are killed by the winter removed, and long shoots shortened to within four or five buds."

SEEDS: *G M G.* All the plants you name are very tender, and require a good hothouse.

WEATHER: *B B.* We dare not undertake the task; it would overwhelm us. For such purposes a newspaper should be established expressly. We cannot receive verbal messages.

MISC.: *H.* Your questions have no relation to gardening. As to the Peppermint, study what has been lately said, and well said, in our columns concerning the perfumes of plants. As to spoiled white wine being converted into vinegar, you have only to leave it in a warm place without a bung in the cask. It will thus become acid enough, if it was originally well made. If it does not change quickly enough, put in a toast dipped in yeast.—*A B.* The price would be 3*s.* or 4*s.*, depending on the length.—*A Country Parson.* We thank you for the hint, and should be only too happy to do what you suggest. But where is the man to be found? We have formerly done something; but the difficulty is enormous. We will try, however, to make some progress, if not much; taking the chance of disturbing a nest of hornets.—*A Devonian.* Calycanthus macrophyllus appears to be a hardy shrub. Golden Yew is a variety of the common Yew, and handsome; read what has been done with it at Elvaston, the fairy land of England. We will do our best to meet your wishes. In fact, we have only just made a journey to the Continent for the express purpose of finding a competent artist, in which we have succeeded.

THE IMPROVED "FLUE BOILER" AND FURNACE.

W. HILL begs respectfully to inform the numerous applicants for his "FLUE BOILER" of a small and intermediate size, that he shall be prepared, early in December, to supply sizes to suit every description of Apparatus, from that of 100 feet of 3-inch pipe to 2000 feet of 4-inch pipe. A List of Sizes and Prices will shortly be published. W. HILL guarantees his Boilers to be the most effective and economical of any in use.
Horticultural Works, Greenwich, Jan. 12.

HOT-WATER PIPES AND TROUGH PIPES, with all the usual connexions.
J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, keeps a very large stock of Hot Water and Trough Pipes, with Elbows, Syphons, Tee Pieces, Collars, Flange Sockets, and Spigots, Throttle Valves, &c., of excellent quality, and at very low prices. Parties requiring the work to be done can have good workmen sent to any part of the kingdom, with everything requisite for the heating, &c., at a stated sum. Rain-water pipes, Sutters, Sash-weights, Railing Bars, Air Bricks, and numerous other castings are also kept at J. JONES's, Iron Bridge Wharf, No. 6, Bankside, London.

The Agricultural Gazette.
SATURDAY, JANUARY 12, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Jan. 17—Agricultural Imp. Society of Ireland.
THURSDAY, — 24—Agricultural Imp. Society of Ireland.

AMONGST the various causes operating for good or evil upon Agriculture, it is strange that so little attention should have been hitherto directed to the circumstances that influence in this country the price and accessibility of Land—the raw material of the farmer's business. It is the more remarkable, because when men were canvassing every argument to show our inability 'to compete with the foreigner,' as the phrase went, one should hardly have expected such a monster evil to have lain unchallenged, as our Conveyancing System. If an Act of Parliament were proposed to be passed levying a tax of from 4 to 20 per cent. upon every transaction of sale or mortgage in land, with the additional hardship of making the weight of the assessment fall upon the buyer inversely with the amount of the purchase-money—so as in fact to make the rich and large purchaser be taxed in the smaller, and the petty buyer in the larger penalty, it is easy to conceive the outcry that would be heard. And yet we have this very system ready-made to our hands and in daily operation upon us, by virtue of what is called the 'Practice of Conveyancers,' backed and countenanced by the absurd scale of Stamp charges rated '*ad valorem*' in a new sense of the phrase, that is to say, at the greater ratio for the smaller amount of land sold and money paid.——It is wonderful what people can be brought to bear in silence, provided the infliction be allowed to grow up gradually and slowly.

Everybody knows that security and permanence of Tenure has the most marked influence on cultivation. A Farmer won't enter into a long contract *with* his land when he has not a corresponding interest *in* his land. But even the longest Leases come to an end, and if there is no prospect of renewal, the good farming, and with it the high condition, gradually drop down to zero with the expiration of the term. It cannot be helped; it is human nature; and will probably always remain so. No man will cultivate for another's benefit as he will for his own: it is vain to ask it—a mistake in ethical science to expect it.

But the aggregate loss to the Nation entailed by the quantity of land in this country lying annually under the influence of restricted outlay by the operation of this hot and cold system would hardly be conceived from its apparently exceptional occurrence in each particular district. The expense of 'getting up the steam,' again, of Farms that have been 'run out,' as it is descriptively called, is out of all measure or comparison with the task of merely keeping on foot the standard of fertility once obtained by good management. The intermediate loss of produce and of employment is, collectively, enormous. The public and the Laborer are thus injured, and nobody benefited.

But if it be true in principle that the Tenant from year to year cannot be expected to enter into as long contracts with the soil he cultivates, as he who holds in it the longer interest of a Lease, and that the Lease itself is only a more extended illustration of the same rule, it needs little explanation to show that the same principle applies to the further comparison of a term of years—or again of a Life-interest—with the Fee simple.

The obvious result as well from one as the other, is national loss, in the shape of unemployed Labour, uninvested Capital, unobtained produce, and undeveloped powers of the Soil. "It is all very well for the proprietor to make this or that improvement," is the remark commonly heard; "he may do with safety and security things of which the result will descend to his children, even if he do not live to reap the benefit himself; but how can it be the interest of the *Tenant* Farmer to lay out his capital on the same scale upon the inheritance of another?" Now what does this mean, but that the *owner* of land is, in point of fact, justified in being a better friend to the public, by laying deeper and more permanent foundations of increased produce, than can be expected from the temporary occupier, whose investments are sure, some time or other, to suffer an extrinsic appropriation of their results, from the effluxion of the term, a change in the proprietorship, or even an alteration of the Rent.

And the argument is identically the same throughout the still higher stages—advanced only in its several degrees—from the Tenant at will, whose interest may perish with the year, up to the Tenant for Life, every sixpence of whose expenditure on the property goes at his decease to the benefit of a stranger, and is so much money lost to those whom the 'out-going tenant' of this world's holdings naturally and justly regards as his surviving self, namely his children; or if his first-born alone succeed to the inheritance, then his *younger* children, or his widow. The Legislature has commenced—and only commenced—the recognition and amendment of the latter evil by the Drainage Bill, clogged however, as we fear such special acts of Government must ever be, by a difficult and, at best, imperfect system of inspectorship and expensive watching. The requirement too is found to be *progressive*. Money for Drainage implies, by no very circuitous route, *more* money for Buildings. The demand is only moved a step, and, when that is taken, will disclose another. Such special acts are ever a commentary on their own necessity: they point, with successional and accumulating force of evidence, to something radically wrong, to some conflicting under-sore which bleeds up through plaister after plaister in succession. The humour must be probed.

It consists, simply and solely, in the attempt to engraft a *commercial scion* upon a *feudal stock*. They will not 'anastomose,' they refuse point blank to grow together. So long as land is rendered unmarketable, except to giant purchasers, by the unwieldy operation of our present system of Conveyancing, so long will its degree and mode of *cultivation* present the most incongruous alternations of bad and good, varying with the motley character of the tenures into which it is squeezed and driven by the pressure of too narrow an ingress and outlet for the capabilities and wants of a growing community. Take *any* other article of sale and purchase—any other subject of one of man's distinctive attributes, the power of EXCHANGE,——a Horse, a Ship, a Steam Engine, a Share in a Company, a thousand pound Stock, or a *hundred* thousand,——who ever thinks, or dreams, of dogging its *History* for sixty years back, of scrutinising its archæological memoirs and incidents, or threading the eccentric sinuosities of its passage from hand to hand down to the possession of the seller! But let the same value be represented in land, the ownership of which is infinitely more a matter of open notoriety, and may have remained in the same family, from generation to generation for hundreds of years, and forthwith all is doubt, mystery, and distrust. Voluminous Abstracts of Title must be delivered containing a full particular of every Birth, Death, and Marriage, that has happened in the seller's family for the last generation or two, and every Mortgage that has been made, every Term that has been created for purposes long ago accomplished; occasioning a delay generally of months, sometimes *of years*, before the history can be made out; and all this at the expense, and future risk, not of the Seller, but of *the Purchaser!*

The practical consequence is that the sale of land in large quantities is troubled and impeded, but in small quantities (through the disproportionate expense) almost prohibited.

The Land of the Country is thus necessarily amassed into immense and overgrown properties; because the dealing with it in smaller quantities is virtually shut out by the inexpressibly preposterous custom—for Law it cannot properly be called, the Legislature having ever opposed it—that the buyer must prove the seller's right to sell, and must trace the proprietary history of a single field for the same long back-period and at the same expense as that of an estate of a thousand acres; paying his Lawyer not according to the extent of the purchase, but according to the length of the Deed, which may be just as long in the former case as in the latter.

The number of purchasers is thus unavoidably reduced, and the market value of the article is proportionably diminished: for it needs no LOCKE to tell us that where purchasers are few and sellers many the value of a thing is lowered, and where purchasers are many and sellers few the value is increased. But the diminution of proprietary value, occasioned by our existing conveyancing system, though reducing land from 10 to 15 years' purchase below its relative value in Belgium, Holland, Prussia, and other countries of Europe, where public Registers of Title exist, is nowhere more injuriously seen and felt than in its effects upon the *investment of capital in Agriculture*. If it be true that under the protection of a long lease, capital and industrial enterprise will go to work, in a very different spirit to that which cramps the energy and motives of a tenant from year to year, in how much greater a degree does this principle apply where the alternative of mere occupation of another man's property is contrasted with the absolute and devisable ownership of that which purchase has made his own.

The Lawyers declare the fault is not theirs. The purchaser of land requires that the Title shall be 'investigated:' the amount of evidence, the long chain of family history necessary to be traced out in order to complete this investigation, has grown by long usage to a length which acknowledges no submission even to the authority of an Act of Parliament to shorten or facilitate it. The 'Custom of Conveyancers,' a convenient anonyme for the refractory evil that cannot be punished for contempt of court, and which sits like an incubus on the landed property of the kingdom, defies all individual attempt, no matter from what quarter, within or without, to relieve its leaden pressure upon the soil. Owners of land, like the wolf in the Fable, would gladly have the bone extracted from their throat, but the trouble and danger of its removal make them such reluctant patients that lawyer Stork is entreated to desist from an attempt that he himself undertakes with no very agreeable anticipations. So there it is allowed to remain festering in the way of everything that attempts to *pass*, and 'enterprises of great pith and moment' are successively rejected and turned aside on account of a preliminary difficulty which every one acknowledges, every one professes readiness to 'sacrifice all private considerations' to assist on the removal of, but no one exactly knows how to proceed against.

We have had a Real-property Commission sitting so long that hope is almost smothered by delay; and meantime all motion and inquiry upon the point is foiled by the eternal answer that a 'Commission is sitting.' We trust, however, that when this subject is again brought before Parliament in the coming Session, owners of land will have begun to perceive its importance to themselves, and not regard it as a mere question for the Crown Lawyers. Facility of Transfer, and patent evidence of title, are not less valuable, nor a whit less applicable, to 'real' than to 'personal' property. The Transfer-books of the Bank of England present the *ne plus ultra* of simplicity in the latter kind, and afford a familiar portraiture of that which a Registry would confer upon the former. Everybody benefits by simplicity: it promotes free circulation as well as Security, and is thus eventually more favorable even to those whose professional services and profits might at first seem shortened by the change. But to sellers and purchasers, to all, in short, concerned in the use or interchange of the commodity, there is but one view of the advantage, *sua si bona norint.*

WE understand, that some of the large Life Assurance Offices have intimated to the Inclosure Commissioners their willingness to advance money to Landowners, for the purposes of the "Private Money Drainage Act, 1849," on reasonable terms. We hope shortly to learn that other parties have come forward in the same manner, and that that valuable Act is in full operation throughout the country generally. For an explanation of the provisions of the Act, we beg to refer our readers to our Paper of the 13th October last, p. 649, and would only further remark, that the early applicants were most successful in obtaining money under the public Drainage Act.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

LIST OF PRIZEMEN AT GENERAL EXAMINATION, CHRISTMAS, 1849.

Agriculture — 1, E. J. Overbury, of Liverpool; 2, V. Rice, of London.

Chemistry—1, E. J. Overbury and T. R. Luzmore, of Liverpool; 2, E. J. Lambert, of Clifton.

Natural History — 1, R. Holland, of Mobberly, Cheshire; 2, E. J. Lambert, of Clifton.

Veterinary Practice—1, S. V. Jones, of Brecon; 2, H. J. Lloyd, of Warwick.

Mathematics, &c.—1, T. R. Luzmore, of Liverpool; 2, E. J. Lambert, of Clifton.

Surveying and Engineering — 1, T. R. Luzmore, of Liverpool; 2, W. L. Smith, of London.

JOHN WILSON, Principal.

ON ARTIFICIAL MANURES, &c.

THE BOTLEY FARMERS' CLUB have, it seems, resolved *unanimously*, that where there is not sufficient dung for

the Wheat crop, it is more profitable to apply concentrated manures than to purchase dung, and that an equal amount of money expended in the purchase of concentrated manures will raise more Wheat over the natural produce of the land than the same amount expended in the purchase of oilcake, or corn, and converted into dung by feeding cattle. I think it must be acknowledged, that this is a remarkable decision, proceeding as it does from a body of practical farmers; for, generally speaking, they have been accustomed to place their whole reliance upon farm-yard manure, even where high farming is adopted, and though numerous individuals have had recourse to guano, yet collectively it may be said that concentrated manures have found little favour in their eyes. Now though the opinion of individuals, and their confident laying down of the law based only on that opinion, is of no value for the advancement of truth; yet, when an assembly of farmers, laying aside their ancient prejudices, proclaim their unanimous conviction of some new fact, their opinion is worth a great deal. All my experiments tend to corroborate the view taken by the Botley Club on this subject, by showing the real value of these concentrated manures, and suggesting thereby the probability, that sometimes they may be substituted with advantage for dung, or at least supply its place when more is wanted; and I have now further evidence to offer to the same effect. I do not mean to say that they have been attended with uniform success, and it would be unreasonable to expect it; for they are not like experiments conducted in a laboratory, where all the materials are entirely under your own control; but a few square rods or yards of soil will sometimes possess a composition so different from the adjacent land, as to perplex the investigation and make comparison in any single instance utterly useless. If the result in question is a failure, the more you multiply your experiments, the more it becomes evident whether such failure is to be admitted as a general rule, or whether it is only an accidental exception; and, therefore, I regret to observe, that accurate experiments upon these subjects have almost ceased to be recorded in your pages—it is the only way in which science and practice can work together usefully; for agricultural experiments, if they are accurately conducted, point out to the chemist the direction in which he should pursue his investigations; while, on the other hand, those investigations point out to the agriculturist what sort of experiments he may try with most probability of success. I, for instance, have been much encouraged to persevere in the employment of the ammoniacal manures by Professor Way's important discovery of the strong attraction of earth for ammonia, an attraction so strong that a solution of the salt will part with its ammonia in passing through a funnel filled with earth; for, if this be so, when more is added than is needed for present use, no amount of rain will wash it down into the drains; but the soil becomes a depository, in which is stored up all that the vegetation on the ground cannot appropriate to itself, and ready to yield up its treasure again to roots capable of extracting it. There is reason, however, to apprehend that any addition beyond a certain amount tends rather to check the action of the manure than to increase it, and therefore a small quantity added every year, is of more use than if the whole were applied at once, even though none were lost by evaporation, or volatilised by conversion into carbonate. Ammonia is so universally favourable to the development of leaf, that to Grass crops it is always beneficial, if it is not applied so strong as to be caustic; but this is a very common fault, and in one case, where the slops from the house were applied not sufficiently diluted, the produce was less than on that part which received none; the same thing happens more or less whenever ammonia is added more than sufficient for the requirements of vegetable action. Take, for instance, these experiments upon Grass.

	Weight of Hay per acre.			Profit per acre after deducting the expense.		
	tons.	cwt.	lbs.	£.	s.	d.
84 lbs. of Croll's sulphate of ammonia	2	5	80	1	16	6¾
Without manure	1	13	64			
56 lbs. of sulphate and 84 lbs. of Peruvian guano	3	0	0	0	19	5½
Without manure	2	10	106			
84 lbs. of sulphate and 1 cwt. of Peruvian guano	2	18	10	0	10	6¼
Without manure	2	9	58			
Or, take these upon Clover:						
75 lbs. of Croll's sulphate of ammonia	1	18	64	0	12	6¾
Without manure	1	12	69			
42 lbs of sulphate and 150 lbs. of guano	1	17	16	0	1	7¾
Without manure	1	12	16			
42 lbs. of sulphate and 150 lbs. of guano, again	1	17	80	0	0	7¼
Without manure	1	12	16			
56 lbs. of sulphate and 150 lbs. of guano	1	17	42	loss	3	5¾
Without manure	1	12	69			

In another field, the same quantity of sulphate, with 50 lbs. less of guano, gave a profit of *7s. 4d.*, which by the addition of ¼ cwt., was reduced in another part to *4s. 4d.*, and so, again, the increase of hay produced by watering the Grass with the drainage from the stables was diminished in this proportion.

	Weight of Hay. Tons.	Cwt.	lbs.
The unwatered part produced	1	9	85
With 400 gallons and 36 lbs. of sulphuric acid ...	1	16	26
With 440 gallons and 50 lbs. of the acid	1	15	13
With 420 gallons and 60 lbs. of the acid	1	11	8

Though the quantity of liquid was less in the last instance than in that which precedes it, yet the strength was greater, being from the horse stable instead of the cows; it appears therefore that when ammoniacal manures are applied beyond a certain amount, the excess above that amount is not only a waste of expense, as far as the profit of that year is concerned, but hinders the full effect of the more moderate dose, by poisoning some of the plants with more food than they can assimilate and digest; the exact proportion in which it should be administered it is not easy to ascertain, without repeated trials, for the same amount acts very irregularly, according to the difference of soils. Thus, for instance—

	Weight of Hay. tons.	cwt.	lbs.	Profit per Acre. £	s.	d.
100 lbs. sulphate of ammonia and 25 lbs. of guano increased the hay from	1	1	58	—		
To	1	12	96	1	9	5½
But when the natural produce was...	1	14	98	—		
The same quantity of manure increased it to	2	10	106	2	8	4

The compound nature of guano complicates the question considerably; for besides ammonia, it contains more than 80 per cent. of other salts, earthy and alkaline, the value of which was proved this year again by 35 lbs. of wood-ashes increasing the acreage of hay to the amount of 8 cwt.—a proof which I recommend to the attention of those who have yet to learn how great a benefactor wood is to agriculture—wood in its destruction, they will say—yes; but the wood must grow in order to be destroyed. Wheat being a stronger plant, seems to receive less injury from an excess of ammonia than Grass; but increase of foliage by no means insures an increase of seed, which of course in this case is the main point; the inequalities of the soil present some difficulties in appreciating the results; but still I think a comparison of the following trials is sufficient to show the inertness of manure when accumulated beyond a certain amount, as far as the formation of grain is concerned.

	Weight of Corn. Bushels.	Weight of Straw. truss.	lbs.
With 56 lbs. of sulphate of ammonia ...	45	106	24
Without it	43½	98	32
With 56 lbs. and 84 of guano	52½	124	16
Without either	52½	122	8
With double the ammonia and double the guano	45	111	4
Without either	45	98	32
With 3 cwt. of guano	45	101	4
Without it	43½	91	4
With 112 lbs. of sulphate and 72 of phosphate of potash ... ... }	45	98	32
Without either	48½	91	4

Now in all these cases it may be observed that although the benefit derived from the manure varied according to the variations in the quality of the soil, yet no increase of ammonia, though aided by other ingredients, increased the amount of grain beyond that produced by the smallest quantity; and where the produce was naturally greater, it did nothing but increase the straw; but it may be said that where the land is already in such a high state of cultivation, it is unreasonable to expect much improvement; but I will show that the same rule prevails in inferior soils, where the action of the manure is more visible, and its value can be measured by profit, the price of corn being estimated at 10*l.* per load, or 40*s.* a quarter. I will select four examples; in the two first, the unassisted produce of the soil, unassisted I mean by artificial manure, though from different localities, was the same, 38½ bushels; in the third it was 34 or 35 bushels; in the fourth it was 30 bushels.

	Profit. £	s.	d
42 lbs. of sulphate of ammonia, 56 of guano	0	5	0
56 lbs. of sulphate of ammonia, 150 of guano	0	4	1½
56 lbs. of sulphate of ammonia, 12 phosphate potash	2	18	7
56 lbs. of sulphate of ammonia, 100 of guano	1	18	10
86 lbs. of sulphate of ammonia, 100 of guano	0	3	10
56 lbs. of sulphate of ammonia	1	3	9
56 lbs. of sulphate of ammonia, 100 of guano	0	18	6
56 lbs. of sulphate of ammonia, 150 of guano	0	16	7½
42 lbs. of sulphate of ammonia, 84 of guano	2	2	0
42 lbs. of sulphate of ammonia, 125 of guano	1	5	2

Now these experiments tend to prove, that as a small quantity of beer is a nourishing drink for a labouring man, but too much is injurious to him, and any indulgence in it beyond a very limited moderation ceases to be beneficial—so it is in the application of that essential element of fertility, ammonia; a small quantity is almost always useful, but when certain limits are transgressed, either positive injury is inflicted by every further addition, or at least it is attended by little or no immediate benefit to the crop, and the profit is diminished in proportion to the increased expense. It is certainly some consolation to know that the surplus is not carried away into the drains by rain; but still experience has not yet shown what changes it may afterwards undergo; and, at all events, it is clear that the same amount distributed over successive years would yield a better return than it can do when applied all at once. But this is not all; the same experiments serve to expose the ignorance of the taunts with which the free-traders assail the agriculturists, not being aware that Wheat cannot be manufactured like calico; they seem to think that if you spare no expense in cramming the earth as full as it will hold with manure, every plant would be loaded with grain from the soil to the top of the ear. You might as well cover your fields with Californian sand and expect to reap gold. They know that there is no limit to the power of producing manufactures, though experience might have taught them that there is a limit to the profits of that production; but they have yet to learn that there is a limit to the powers of fertility; that every species of soil has its own maximum, beyond which no skill or expense short of madness can force them to rise; that the composition of its bulk, on which so much depends, is not within agricultural control; and that to require the worst to be made equal to the best is not less unreasonable than it would be to expect Soyer to make an excellent dish out of horse flesh by any application of condiments and sauces and culinary art. It is therefore a cruel and senseless mockery to tell the farmer who has wrought his land up to its highest capability, that he must repair the injuries inflicted upon him by theoretical legislation, and defeat the competition of the foreigner, with all his superior advantages, by increasing the produce of his soil. But to stimulate the inactive farmers, of whom there are still too many, to reach that maximum by improved cultivation, to show them what is possible on soils of similar quality, and to make them discontented with anything short of it, is another object of these experiments. Some methods of improvement, however, there are, which, being still matters of dispute and doubt, cannot be received into general practice till time and frequent experiments have proved their value. One of these is thin sowing, the expediency of which some of its advocates begin to doubt. My experiments have this time been upon the whole rather favourable to it, as the following table will show. In order that the results might not be attributed to any particular mode of cultivation, the seed was sown in three different ways—broadcast, dibbled, and dropped by hand in the lines formed by the presser, and in five different proportions, 4, 5, 6, 7, and 12 pecks.

Pecks per Acre.	Broadcast. Corn. bush.	Straw. truss.	lbs.	Dibbled. Corn. bush.	Straw. truss.	lbs.	Dropped. Corn. bush.	Straw. truss.	lbs.
4	40	120	0	40	105	20	30	107	28
5	35	98	32	40	102	8	40	115	20
6	37½	93	12	42½	111	4	45	125	20
7	40	112	8	40	120	0	40	102	8
12 in 2 instances	40	108	32	It was thought useless to try these in the same proportion.					
in a 3d	35	113	12						
in a 4th	33½	88	32						

From these experiments I infer—1, that though very thin sowing may sometimes answer, yet it is not safe; it cannot afford the loss of seed which animals and weather sometimes occasion; and 2d, that such thick sowing as 3 bushels may not only safely, but with advantage, be reduced to one-half that quantity; with advantage not only in the economy of seed, but also from the greater amount of produce. Further experiments will either confirm or rectify these conclusions. 2. Although it is impossible to change clay into sand, or chalk into either, yet it is not impossible to improve the texture of any stiff soil, like that which lies over our chalk (which, though not clay, has yet a sufficient mixture of alumine to make it sometimes very intractable), by burning or rather charring a portion of it. Gardeners, whose operations being on a small scale, and therefore attended with little risk, lead the way often in cultivation, like pilot balloons, which are sent up into the air to show the direction of its currents to those who are to peril their lives afterwards in a larger one; they begin to be aware of the utility of burnt soil and charcoal in the growth of their plants, there is reason therefore to expect the same good effect in the larger operations of husbandry. In strong clay soils it has been frequently practised with excellent effect; but not, so far as I know, on soils of less tenacity. My evidence upon this subject is not so full as I hope to make it hereafter, but the following facts encourage further trials. Two modes of burning were tried—in small heaps and in large heaps, and the results are instructive. The first was the most successful, not because it was the best, for I believe the contrary, but because it was the easiest; the difference to the eye was, that the ashes of the small heaps were black, in the other red. The real difference was, that the great draught of air occasioned by the combustion of the larger quantity of fuel supplied oxygen enough, not only to convert the black oxide of iron, which coloured the soil, into the peroxide, but also to convert the carbon into carbonic acid gas, most of which escaped, though some portion of it would be absorbed by the ashes, and become, so far, a source of fertility. The remedy is obvious—the soil should be heaped up more quickly, to check the rapidity of the combustion, but yet not so much as to extinguish the fire by precluding all access of air. The principle is the same as in burning charcoal, but the management is more difficult, because the material is not so capable of slow combustion; but under right management a much larger amount of soil would be roasted in proportion to the amount of fuel consumed. The crop of Swedish Turnips which grew on the burnt ground last year, without any farm-yard manure, was superior to that which received 14 loads per acre; but that perhaps is no more than might be expected from land in good condition, which would be better prepared for that particular crop by the effects of the operation; but the question was, whether the succeeding crops

would be the better for it too, and that is answered for one more year by these experiments:

Oats.	Quantity produced.		Weight of Straw.		Weight per Bushel.	
	bsh.	gals.	trus.	lbs.	lbs.	oz.
On soil manured with 14 loads of dung	75	0	110	0	39	6
On soil burnt in large heaps...	75	0	116	24	39	8
On soil manured with 14 loads of dung	80	0	115	20	39	12
On soil burnt in small heaps...	82	4	122	8	40	4

Thus it appears that in the production of corn, burning the soil is an equivalent, and more than an equivalent, to 14 loads of farm-yard manure, and increases both the weight of the grain and the bulk of the straw. It is not liable, therefore, to the objection which may be urged against ammonia alone, that, when applied to Wheat, it sometimes injures the weight when it increases the straw. The same conclusions receive further corroboration from the renewed experiments upon the cultivation of Wheat, year after year, in the same ground. On eight of the plots devoted to these experiments seven years ago, the produce of one-half, which was sown with good grain, weighed 68 lbs. 14 oz., and the straw 109 lbs. 6 oz.; of the other half, which was sown with bad, or tailing, Wheat, 63 lbs. 10 oz., and the straw, 103 lbs. 2 oz. This year, although none of them have received any manure during all that time, except a small quantity of two salts—phosphate of potash and carbonate of ammonia—and one quarter of them have had none at all of any sort, yet this year the produce in grain falls little short of that which the same ground bore at first, and in bulk of straw far surpasses it.

	Corn. lbs. oz.	Straw. lbs. cs.
The good seed produced	61 4	162 8
The bad produced	63 2	168 8

Nor is this due only to the energy of the artificial manures; for that portion which has had no manure at all during the whole seven years, except its own ashes, has had its weight of grain raised from 25 lbs. 4 oz. to 27 lbs. 14 oz., and of straw from 44 lbs. 8 oz. to 71 lbs. Now, it is possible that some portion of the ammonia sprinkled upon other parts of the experimental ground may have been volatilised, and transferred hither by the united agency of wind and rain; but since the effect has been most visible since the practice was adopted of burning the weeds and roots upon the soil in which they grew, it is reasonable to attribute it principally to the action of fire, and then that part would be most fertilised which, from the abundance of its vegetable matter, received the greatest proportion of ashes and of burning; for it is very remarkable, that the thin seed, which got no other manure, yielded a better return than the good seed, in the proportion of 15 to 13, and 7 lbs. more of straw. Of the three salts that I have named, the most efficient was the phosphate of potash; and I wish to call the attention of manufacturing chemists to the value of this salt in agriculture, because I had very great difficulty in procuring it at all in large quantities. It may sometimes fail, like any other manure, but it is generally successful when used in moderation; which, indeed, is no more than may reasonably be expected, when we consider that an average acre of Wheat contains 20 lbs. of phosphoric acid and 23 lbs. of potash. In my experiments, the largest profits stand to the account of phosphate of potash combined with small doses of ammonia—for instance,

8lbs. sulph.ammon. and 18lbs. phos.potash, gave 1*l.* 17*s.* 6*d.* profit.
26 „ ditto „ 12 „ ditto „ 2*l.* 18*s.* 7*d.* profit.

Where the quantities were greater, the profit was less: 36 lbs. sulph. ammon. and 36 lbs. phos. potash, gave 1*l.* 1*s.* 11*d.*

I have extended these observations to so great a length, that I must hasten to a conclusion, and, without entering into all the details of the other experiments, content myself with giving the general results of the four other salts tried. This was the order of success; 1, sulphate of soda; 2, muriate of ammonia; 3, phosphate of soda; 4, nitrate of potash. In all these cases, the produce was not much less than it was seven years ago; in the three first, 2 oz. of the solution succeeded better than 4 oz.; in the third, an anomalous case occurred, the seed was only steeped in the solution, and received no other dressing, and the plants were only hoed once; yet the produce was more than where it was afterwards watered with the solution, and hoed several times, but the advantage of hoeing was distinctly shown—it added 6 lbs. of corn to the crop which was watered with the solutions, and 8 lbs. to that of which the seed was only steeped. Different portions of each were hoed one, two, three, and four times; and those who have a superstitious preference for odd numbers will be glad to learn that they beat the even numbers in the proportion of 3 to 1. Lastly, for the encouragement of experimenters, I may add, that these numerous trials of artificial manures have been attended with no loss; but after balancing the success against the failures, calculation gives a profit of 8*s.* 4*d.* per acre over an extent of 35 acres. *L. Vernon Harcourt, West Dean House.*

ABOUT DRAINING.

Is there still a farmer who disbelieves in dainage on strong clays? Let him walk with me some such wet week as this, and his prejudices must vanish; if not they ought to do so. Well booted and umbrella'd, I delight in watching the operations of Nature (and of art), during her heaviest rains. It washes away prejudice by actual fact. It does happen that I have some straight water-courses freed from weeds, sedges, bushes, and other impediments. These form a strange contrast to the contorted sinuosities of the natural uncleansed brooks. In one case the impetuous flood gliding on rapidly but steadily, soon subsides; in the other venting its rage on one side, rebounding to the opposite bank, tearing up holes and throwing up hills, but scarcely advancing, whilst its rear, impatient of delay, revenges itself on the negligent farmer, by flooding a portion of the adjacent fields.

Well, then, having disposed of the main outfalls, let us discourse about feeders. But stop; if we cannot avoid having a crooked ditch, let us by all means keep it clean and open, and above all, notice that the bank or fence side is constantly growing into the ditch, whilst the brow is washed away. Let us therefore pare down the excrescence of the bank, which the matted roots are sure to sustain, and have an especial regard to diminish the convexity of the projecting curves, making the ditch rather deeper on that side, and so draw the stream as much as possible from the concave or opposite bank. But will 1-inch pipe drains run freely, placed 5 feet deep, in our poor, strong, yellow, unctuous, tenacious clays? Tenacious, indeed; for, when heavy rains fall on them, they look as smooth as a sheet of highly-glazed yellow Bath post, but if you tread on them, especially after frost and rain, it is a question which is the strongest, you or the bird-lime-like clay. *Entre nous*, it is an error to suppose that you can by drainage change these soils into black mellow humus, or alter their general character. It is not reasonable; for a 7-inch ploughing turns over 700 tons per acre, and our 20 tons of manure, once in three or four years, is a mere flavouring to such soils. Still, without drainage, it is ruinous to farm such land in wet seasons. Another great mistake is to suppose that, because this land is drained, no furrows or water-furrows are required. I have tried some on the flat, and suffered for it in the next spring, and in fact for two years, the difference in the friability of the surface being apparent for that period. Our furrows are not like those huge and absurd mounds in the midland counties. Our lands are 7 feet 2 inches wide, perfectly flat, and the furrow the depth of the ploughing. When continuous rains occur, or a hasty shower, which falls quicker than the earth can imbibe and filtrate it, it oozes or flows into the furrows very quietly, and is received at various intervals by cross water-furrows, which are deeper than the stetch-furrows. These cross or water-furrows intercept and conduct the water to the side ditches, or open ditch, before it accumulates. The volume and momentum which would in a large field accrue are thus broken and subdivided, so that the surface soil is not driven into the open ditches. There is no loss of land by these furrows on drained land, for at harvest they are scarcely perceptible. Much mischief has been done by laying cold tenacious soils on the flat.

With reference to the comparative merits of deep and shallow drainage, it is quite certain the more numerous your taps the quicker you will empty the cask, and the deeper you put them in the more liquor you will draw out. It is now a settled fact that deep drains will run longer and discharge much more water than shallow ones. The cause is obvious enough; 5 feet deep of earth will imbibe or receive much more water than half the depth, or 2 feet 6 inches, on the same principle that a cask 5 feet deep, when empty, would receive twice as much water as one only 30 inches deep. By the same rule, deeply drained land will not, after dry weather, discharge water so soon as shallow drained, and, indeed, will not run at all after the first few autumnal rains, provided those showers are only sufficient to moisten so deep a mass of earth; but when charged with water in winter, the deep drains begin running rather sooner than the shallow ones, and continue running much longer. I observe the water is more pure and clear from the deep than from the shallow drains. It is better filtered—a decided advantage to the farmer.

One heavy land field, drained 5 feet deep and 50 feet apart, at a cost of 32*s.* per acre, discharges its water very much more readily than it used to do. I attribute this to very deep cultivation. Where the proprietor drains it is best to err on the safe side, by draining more closely, but depth is most important.

We are all, I suppose, agreed that open ditches in strong clays do not under-drain the adjoining land. I knew of an open ditch that was filled up after putting pipes into it. It never before discharged water from the adjoining land, but it does now. The reason is obvious—the capillary power exerted at the sides of the open ditch was stronger than the force of gravity. I know of several heavy undrained farms thrown up and reduced 10*s.* per acre in value—a severe penalty for not expending 3*l.* per acre in drainage. *J. J. Mechi, Tiptree Hall, Dec.* 17.

Home Correspondence.

Holidays in Ireland.—I send you a list of the holidays of obligation observed by the Catholics of Ireland, and your readers may judge whether "the greater number happens at hay-making and harvest-time" or not. January 1st, January 6th, March 17th, March 25th, Ascension Day, occurring generally in May, Corpus Christi, in May or June, June 29th, August 15th, November 1st, and Christmas Day. I may also observe, that the people are not forbidden to do any necessary work on those days, which any one who has any knowledge of the country knows well; on the contrary, I have always seen the people willing to do such work as saving hay and securing corn, when bad weather was apprehended. *W. Whitaker.*

Wheat v. *Oats.*—At the price of Wheat, compared with its nutritious properties, I am of opinion that it is cheaper than Oats for the purpose of feeding cattle and horses; but I fancy I have somewhere seen (probably in your pages) that horses do not thrive upon Wheat. If I am not mistaken in this recollection, will you be so kind as to give the reason for this opinion, which I am not able to reconcile with the fact that bran is so good for horses. My idea is that a feed, composed of half Beans, half good sound Wheat (both crushed), would contain almost twice as much nutrition in it as the same weight of Oats; and if I am not prevented by your unfavourable opinion, I mean to act upon this idea in the keep of cart horses. *T. G.* [Wheat is certainly not a wholesome food for horses. It is apt to collect in the stomach and intestines, and cause indigestion and obstructions. This may possibly arise from having so large a per centage of gluten. It requires to be made into bread before it is wholesome food for man or beast. Even if wholesome, we doubt its economy. Wheat at 5*s.* per bushel of 60 lbs., is just 1*d.* per lb. Oats at 2*s.* 3*d.* per bushel of 36 lbs., or 18*s.* per quarter, is only ¾*d.* per lb. Beans are more nutritious than Wheat; and at 36*s.* per quarter are cheaper, though too much of this food will not agree with horses. See Prize Essay on the Management of Farm Horses, in the Journal of the Royal Agricultural Society of England. *W. C. S.*]

Qualification of Land Agents.—In the *Gazette* of Dec. 8, I observed an article under the above head. On the whole the remarks are judicious and not inapplicable, but in my opinion the writer has struck upon a sand-bank, which has proved fatal to many agriculturists as well as others, viz., that of attaching undue importance to theory, to the omission, or at least the neglect, of practice. He says, "A landed proprietor should insist upon his agents having gone through some regular course of study." Now, I assume that, notwithstanding a man having gone through the regular course of study here spoken of, he may still remain very ignorant of the business in hand, if to all his theoretical studies he has not added some degree of experience in the management and culture of land. This assertion is not an unfounded one, nor do I make it without a firm conviction of its truth. How often do we see those who have spent years in such study cutting a most lamentable figure when brought to put their theory into practice; they then experience that, however easy it may be to cultivate imaginary farms with paper and ink, the same assumes a very different aspect when they are brought into contact with the "stern reality." After many trials and disappointments, we are at last brought to see that six months' practice is worth more than two years of their so-called agricultural duties. Let it not be supposed that I look with contempt upon the assistance of science, far be it from me to do so or to deny the advantages our agriculture has derived from her researches, neither do I uphold the old or low system of farming, a system which is daily losing ground, before the gigantic and advancing strides of the "new views." But when I see men who have attained to a considerable degree of perfection in their business, by the experience of many years (land agent or farmer, as the case may be, for my remarks apply to either) entirely set aside by the agricultural students and fireside farmers of the present day, I cannot forbear to lift up my voice and opinion, however weak and humble they may be, in their behalf. *B. M.*

On Fatting Cattle.—Having spent my earlier years in a part of the kingdom where cattle-feeding was practised by most of the farmers for profit, and where, without doubt, the greater part of their rents, &c., were paid by it, even after sending them more than 500 miles to Smithfield-market, I have been a little surprised to see it stated by some of your correspondents that cattle-feeding does not pay. But, if you will allow me, I will assert that it may pay under ordinary circumstances; and although I do not produce a set of figures to prove this, I think I shall produce proof equally conclusive. In the parts to which I allude — the counties of Banff, Aberdeen, Kincardine, and Moray—it is a practice with some farmers, who may not have stock sufficient to consume all the Turnips that they grow, to let part of them to butchers or others, who send the beasts to consume them on the farm. The farmer generally lets the Turnips at from 8*l.* to 10*l.* per Scotch acre, and supplies house room and oat straw, and carries the Turnips. The cattle man, who pulls the Turnips and looks after them, is paid by their owner, and boarded in the farm house. I know farmers, also, who have a fancy for cattle feeding, who take Turnips in addition to their own on the same conditions; and that it does pay, there is not the shadow of a doubt; and in this case the somewhat common practice of making up the want of profit by the superiority of the dung cannot be resorted to, as the owner of the Turnips, not of the stock, has it, which he may set down against the straw used and the dressing of the Turnips; and then he is left with his 8*l.* or 10*l.* clear value for his Turnips. And this will also lead us to suppose that Turnip growing is not quite such a losing concern as some Dr. and Cr. accounts make it; for 7*l.* per imperial acre will go a good way to grow Turnips. I shall try to explain, at another time, a reason or two why cattle feeding does not pay with some. *G. S.*

Farm Labourers' Cottages.—The Royal English Agricultural Society has given to Mr. Goddard, Architect, Lincoln, the prize of 50*l.*, offered during last

year, for the best essay and plan on the arrangement and construction of labourers' cottages. A detailed statement accompanies the essay, containing the cost of every item, both in kind and amount. Whatever may be the professional merits of the latter part of Mr. Goddard's performance, practical experience will not acknowledge that any material improvement has been effected by the doings of the society, in the ground plan of the accommodation. The two cottages are joined under one roof, there is only "one" room on the ground floor, the scullery forms the other apartment, and has a window opening to the south front, and the door (only one), is placed in the north-east corner of the respective ends of the cottages. That quarter must ever be a cold exposure, and in the prize plan, a porch is not placed for the purpose of shelter. We think two apartments on the ground floor to be most essential to every improved accommodation, for the separation of age and sex, and for the use of different purposes. Mr. Goddard withholds any more room, in order to prevent the congregating of multitudes in one house, and consequently his ideas improve nothing beyond the old-fashioned pinfolds of 10 square feet, huddling together a whole family within that very limited dimension. No house ever can be clean that has only "one door," for every purpose of ingress and egress, the very name of scullery supposes a backward position, and a door to itself, by which to discharge the filth of its occupation. We think that on these two very primary points, the plans of Mr. Goddard are defective. We like the small area of back buildings, as being essential to every living accommodation —the three bed rooms on the second floor are a good arrangement, though the three doors open in an awkward jutting manner on the head of the stair. The cost of each cottage, 90*l.*, might give a better accommodation. *J. D.*

Cumberland one-horse Carts.— A correspondent, "L. V. R.," who has discovered what he considers an improved cart, is set upon with as much asperity by some as if he had seen a sea-serpent. The writer of this thinks he can improve on the account given. He has had made an unusually large cart for a horse from 17½ to 17¾ hands high; the wheels 4 feet 5 inches in diameter, very strong and well finished, but without side boards or name plate, for the cost of 8*l.* 11*s.* 6*d.*, in Cumberland; back and belly-band are excluded from this expense. *Alter.*

Manure Shed.—Your Paper of Dec. 29 asks for the measurement of my shed—the length is 30 feet, the width inside the wall 13½ feet, and the height from the ground to the beam, 8 feet; the wall round it may be of any height (2 or 3 feet), according to the situation, and the floor should be hollow in the middle and composed of gravel or broken stones, so as to continue smooth, and not cut up with wheels. A cask must be placed to receive the liquid produce of the houses, and a keg or small barrel cut in two makes a convenient implement when fixed on a long handle for emptying the cask into the manure. The shed being close to the cow-houses, the manure is of course always under cover; it never is in the slightest degree fire-fanged, which I suppose is owing to the exclusion of water; because, I have another dunghill which is equally well constructed for retaining its liquid contents, and better attended to, as to being regularly spread and trodden down by pigs, and by a wheelbarrow, but it is without a roof: the manure from it is generally equally good in quality, but there is often a layer of fire-fanged dung in it. This last dunghill, however, contains only horse-dung, the other one is a mixture of stable and cow-house manure, which may make the former more inclined to heat. I have often remarked that, after a rainy night, the barrowsful of manure that have not been spread, but lie in heaps, are in a violent state of fermentation; but the body of the manure is not so, from being pressed close together, as it is in cattle boxes, where it never heats. *H. W. Myddleton.*

Present Rents with Present Prices.—My own ideas of the capacity of land are so great; we have so little arrived at a just knowledge of the means of production; we have so much to learn, generally, in the higher grade of farming, that, speaking of the country at large, if landlords and tenants will co-operate in carrying out such an improved system as the case requires, there can be little room for despondency—more for hope—in case prices do not fall lower than they are at present. In taking this view of the case, we must look at the country at large. In many parts of it there are large tracts lying almost idle in poor Grass. These are kept as they are, either because they could not be broken up and properly cultivated without an expense which the tenant could not afford, or because he would want intelligence how to manage them when broken up. There is no doubt but these might pay an infinitely larger rent, if placed under a judicous course of husbandry, and would greatly benefit the tenant himself. If such a tenant is not equal to the undertaking, he should give way to one who is; but if every disposition is shown on his part to carry out the well-laid plans of his landlord, some allowances may be made, and some assistance afforded, in prosecuting the good work. In other parts, where the farming is of a better description, and where we cannot look to so great an amelioration of the soil, we can have only to depend on the improved practice which modern discoveries have introduced, and which, except with a few highly gifted individuals, have not been brought to that degree of perfection which they are capable of. We are as yet far from being acquainted with the maximum of production which the land is capable of. Take Wheat for instance. The usual distance in the rows is 12 inches apart, but in a late Number of your Journal the quantity of grain at 12 inches was 5 quarters, that at 6 inches was 6 quarters 7 bushels. The superior merits of high farming have only of late attracted peculiar notice; and there is little doubt but that if Mr. Huxtable had attended the meeting at Sturminster the other day, as was expected, he would have been able to show to the satisfaction of the company that a fair profit may be made with prices such as they are. If 40 bushels of Wheat are grown on an acre, there will not be much reason to complain of the present price. But in many cases not more than 20 bushels are grown; which shows that it is not so much high rents which do the mischief, as low farming. In looking to the future there appears to be more danger from prices falling still lower, than from any failure with them such as they are at present. We are now only at the commencement of the working of the new measure. There is no doubt much fresh land abroad will be brought into cultivation, solely with the view of pouring their produce into the English market. These lands, many of them, are of the richest kind, such as on the banks of the Ohio, and from the mass of emigration poured into them from Ireland and other parts, can afford to raise corn at a much cheaper rate than ourselves It may be said, there is the expense of the traffic; but ships are now bringing it over to Liverpool free of cost, in case the speculation is a bad one; if the reverse, a price is paid on the profit. The farmer has not probably had much reason to complain (thanks to a merciful Providence) during the present year. The crops have been abundant, and perhaps they were never secured before at a much less cost. The trial will be when a bad season comes. Our corn may be spoilt, that of other countries good and plentiful. In former times, increased prices made some amends for deficiency of produce. In this case, we shall have our own corn almost unsaleable, and less of it to sell at a reduced price, whilst our markets may be still more than ever inundated with foreign grain. This article should not be closed without a few remarks on what appeared in your Journal the other week, that Lancashire was famous for being the worst farmed county from London to Edinburgh. To any one travelling by railway, it must be allowed that such must appear to be the case, as you pass through a country which has not a vestige of decent farming in it. But there are other parts which are perhaps farmed just as well as most others in the kingdom, such as Speakes, Orrel, Sefton, &c. The Scotch farmers, too, who have settled in the Fylde, have brought their own good style along with them, and may be held up as a pattern to all England. If the worse parts are so bad, we may indulge the hope that, as the spirit of improvement is abroad, there may be a larger scope presented to them for surmounting the difficulties of the present times, and that they will not succumb under the depressing movements that seem to pervade the southern regions, but maintain present rents with present prices. *Law. Rawstorne.*

Scotch and English Farming.—I have read with pleasure the comparison made in your Paper of Dec. 15th, as to the practical merits of North and South-country farming. It is a subject that will tend to the advance of profitable farming, by bringing into notice the best and most economical methods of cultivation, and I fully agree with you that the success of the farmer depends more upon "rightly directing and applying" the physical force of the farm, than the aid already given to us by the discoveries of the chemist and geologist. But superior as the farming may be in the best cultivated districts of Scotland, as a south countryman, I will not grant that we are to look only to the north for the example to be followed in every instance—for there is always some peculiarity of management which may be suited to that particular place, or that may be adopted with some advantage elsewhere. Nor will many of your readers allow that the amount of labour employed upon a farm in Suffolk, as compared with a farm in Scotland, can be taken as a proof of the superior management of the latter—unless further comparison is made as to soil, the kind of management required, the kind and value of the produce, and the cost of production. And as an inducement for you to enter further into the subject, I beg to say a few words upon the following extracts from the article in question. "It is quite notorious what fallacious guides farm accounts have been in this respect, but if the total expenditure in any department is taken throughout the year, and made matter of comparison, there is less risk of being deceived. Let us take one example, which will readily show the economy of the Scotch system in one important item, that of horse-power. Raynbird, in the agriculture of Suffolk, states, that on a light land farm of 240 arable acres, 10 horses would be kept; the same number of horses in Scotland would only be required for 340 acres of land of the same description, farmed on the four-course shift, although the grain was all threshed by horse-power. This is not easily accounted for where the manual labour is also much greater. How far the employment of the gigantic waggon and the cumbrous tumbril, conjoined with small enclosures, may have an influence in furnishing these contrasts, it is not for us to determine." I believe the statistical account of the 240 acre farm is given at page 143, of the "Agriculture of Suffolk." Now instead of its being a farm of 240 acres, it is one of 300; there being 60 acres of pasture land, which requires in Suffolk some expenditure of horse labour, to keep it in condition, as well as during the hay harvest. The occasional application of heavy dressings of soil to the pasture, and other direct or indirect cartage, will of course increase the number of horses required to work the farm. And again the light arable land of Suffolk requires claying before the tenant can bring out its full capabilities; and this is not merely an occasional dressing, but it is a process that is continually going on upon the farm, and swallows up all that surplus horse-power that you imagine we may dispense with. The several crops grown upon the farm you have referred to are also stated in the "Agriculture of Suffolk," and I ask whether the growth of Mangold Wurzel and Carrots (crops that are removed from the land to the farm-yard), does not require some additional horse-power. And I think it is but fair, now that you have come to the conclusion that Scotch management is the best and most economical, that you should also give us some further data, upon which your opinion is founded; and until this is done, I fear your south-country readers will think that the "gigantic waggon, and the cumbrous tumbril" are not the only causes for the employment of an additional number of horses. My object is to obtain, and if possible to impart, information, and I am quite ready to grant that so far as regards the use of one-horse carts, and the arrangement of the barn machinery, that you are far before us, but have you not yet to avail yourselves of the use of the drill, which the Scotch farmers will ere long adopt more generally, though it may occasion them to employ an extra horse or two. *Hugh Raynbird, Laverstoke, Hants.* [On our farm, 240 acres are managed by seven horses. The rotation gives us 150 acres of grain crop, only 30 acres of Clover, and 60 acres of Swedes, Mangold Wurzel, and Carrots, *all* of which are carried home. At the same time we must acknowledge that our labour bill for manual labour is far greater than on the common Scotch farm. The quality of our land is indicated by the rent, which, with tithe and poor-rates, amounts to at least 50*s.* an acre.]

Maize, or Indian Corn.—I have no wish to occupy any space in your Paper in discussing whether Maize may be generally grown in England, or whether, if it may, the crop is likely to be profitable. The cultivation has lately had a fresh start, and those who make practical trials of what the plant can do here will be the best judges of such questions. In my former communication, which appeared in your Number of the 31st of last March, my principal object was to show Mr. Keene, and the public, that in much of what that gentleman asserted last spring, he was in error. That he was in error has since been demonstrated to Mr. Keene, though he will not see it, but replies thus: "I cannot consent to make it a personal question of Cobbett *v.* Keene, or Keene *v.* Cobbett." A just remark perhaps, that is, from anybody but Mr. Keene, he having, in the language I before quoted, originally made the matter so much that which he now says it ought not to be. But, to my business in hand, which you will perceive is a proper sequel to the remarks I before addressed to you. In the first place, you have yourself, in the *Gardeners' Chronicle* of Nov. 10, confirmed my statement that Mr. Keene's name "40-day" is nothing more than old name, a translation of the French *Quarantain.* The very same name was long ago used by the Italians, whose *Mélica*, or *Méliga Quarantina* may be found in print in Mr. Loudon's *Gardeners' Magazine* (vol. v., p. 106, date 1829), where it is translated "40-day." Secondly, Mr. Keene having, when before the Agricultural Society, and in his "Facts for Farmers," asserted that his hybrid was much more dwarf and more early than the corn before tried in England, I have, in order to obtain the best proof, this year grown all his three varieties on the same land (borders of Lancashire and Cheshire), with the older sort, called Cobbett corn. The result is, that Mr. Keene's hybrid shows itself to be taller than the old kind, by about one-third, considerably more backward in ripening, and far less approaching to perfection in filling the ear with grain. Mr. Keene's is both a dwarf and a very early kind, as compared with many others, but it is manifestly a larger and later plant than the old *Quarantain*, 40-day, or Cobbett corn, taller, stouter in the stem, stronger in the root, and putting out the ears at a point much higher from the ground. This is the conclusion I draw, not, however, without taking the precaution to cause the same varieties to be grown, in the same way, by other persons in the same neighbourhood. I have sent specimens of each of the crops for the inspection of the Farmers' Club at Botley (before whom Mr. Keene recently lectured), and the same specimens have since been laid before the Agricultural Society in London. In your Number of the 10th of November, you observe, that "ripe specimens of 40-day Maize, and of Cobbett's corn, were exhibited on Tuesday last, to the Horticultural Society, by Mr. Charlwood, the eminent seedsman in Covent-garden." Now, to whichever variety the name "40-day" may rightly apply, permit me to say that Mr. Charlwood has, in fact, had no "Cobbett's corn" to exhibit. I have seen what he had at his own shop. That which he has considered as being "Cobbett's corn," is certainly excellent of its kind, but it is the real *maïs à poulet*, or chicken-corn; and I purchased some of it from him, in order to send it with other specimens of chicken-corn, to the Farmers' Club and the Society, to show that Mr. Keene, first representing the "Cobbett corn," as a thing 15 feet high, had been equally wrong when he afterwards confounded it with the chicken-corn, the most dwarf of the tribe. Very near to the shop in which Mr. Keene's corn is now sold, in Covent-garden market, there is

another shop where you may see corn which has been grown by a farmer at Reigate. This latter is the real "Cobbett corn." *James P. Cobbett, Manchester, Dec.* 17, 1849.

Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND, *Jan.* 3.—The Secretary laid on the table the draft of the instructions for the guidance and direction of the Instructors in their different districts, and the course the different local bodies should pursue, to secure due attention to their duties; as they felt that the success of the measure depended entirely on local co-operation and assistance, without which the efforts of the Instructors would be comparatively useless. The following are extracts from the document referred to:—"The object of sending out the Practical Instructors being to communicate information to the working farmers, the Instructor, under the direction of the local officer to whom he is accredited, shall devote his time and attention exclusively to the instruction and improvement of that class, and shall encourage and stimulate them to habits of industry and exertion at all times in the year; reminding them that every season has its own appropriate work to be done on the farm; he must also strongly impress upon them the advantages of an improved system of husbandry in all its branches. The Instructor will be expected, as far as practicable, personally to superintend the several operations on the different farms in his district, from time to time; and his exertions in this respect will be judged by the improved appearance of the land and the crops under his management." The following are the leading subjects to which the Instructor should direct the attention of the farming classes:—1. The necessity of turning up and digging the tillage land deeply and well in winter, in order to expose it to the effects of the frosts, and to prepare it for cultivation in spring. 2. The advantage of removing surface and other water, levelling all unnecessary banks and ditches, and spreading their contents, either in compost or otherwise, upon the land. 3. The profit to be derived from the preparation of manures of every description, by collecting weeds, scouring ditches, and accumulating bog mould, sand, sea-weed, or dung in heaps, and in proper positions, for easy distribution in the spring. 4. The necessity of house-feeding stock of all kinds, for the purpose of saving their manure, and collecting it in proper dung-pits and convenient places, on the principle that all fertilising substances should be again restored to the land, to prevent it from being exhausted by over-cropping. 5. The benefit arising from the adoption of a proper rotation of crops, suited to the different soils, and the observance of the Golden Rule, that no two grain or white crops should ever succeed each other, without an intervening green crop between them. 6. The benefit to be derived from the cultivation of green crops generally, such as Turnips, Carrots, Potatoes, Parsnips, Mangold, Cabbages, Peas, Beans, Clover, Rye-grass, &c., so as not to depend exclusively on any one green crop, but to put down as great a variety of manured crops as possible. 7. The nature and importance of the culture of Flax, and modes of preparing it. 8. The manufacture of butter, and mode of saving it, for the London or home market; and, above all things, the necessity of strict care and cleanliness in making it, upon which its value chiefly depends. *Edward Bullen, Secretary, Society's Rooms,* 41, *Upper Sackville-street, Dublin.*

GLOUCESTERSHIRE AGRICULTURAL SOCIETY.—At the late annual meeting of this Society, Mr. HEWITT DAVIS said—

An advantage attended such meetings as these in the opening it gave to agriculturists to learn from each other what to be doing in these times. Unfortunately their situation was now so embarrassing that it became a matter of necessity to take every opportunity of introducing improvement. The times were adverse to the agriculturists, the prospect before them was doubtful, and the future had no bright hopes. But as there were many in England who had all the property they possessed at stake in the soil, it would not do to despair; and he was happy to tell the meeting that he did not think the agriculturists need despair. For low as prices were, they had been as low before, and they had shown their ability to farm with them, and when they did not possess the assistance which they now had to meet the times. In addressing those who were occupying farmers he must say that he saw they were under great difficulty. In passing through the country he had seen much land which was not farmed as it ought to be. But then he knew no men could farm properly when their land was smothered with trees, or its vegetation retarded by stagnant water. In these and other points the landlords must assist the tenants. The removal of trees was one ready way in which the landlords could help in the improvement which was necessary to the existence of the farmer. But they could do more. Let the landlords put the land in a fit state, and let them give their tenants leases, that their children might have the benefit of improvement after their fathers. Draining was one way of improving; and there was no doubt that the produce of arable land might be increased three-fourths by draining it. That increase, moreover, was all profit—it was more than all profit; for this reason, that undrained land, while the produce was small, was not only difficult, but more expensive to cultivate. The gentlemen present knew very well that with undrained land horses very often stood idle, as it was no use attempting to work it while wet. Besides waiting, they had to roll and harrow and tear the clods to pieces; whereas if the water had been drained from the land much of that labour might be spared; and the farmer would be enabled to introduce the cultivation of a number of plants which the land in an undrained state was unfitted for. The foundation of profit in farming now was right and improved cultivation. But a great deal of land was unfit for cultivation, from the want of draining. He mentioned draining particularly, because it presented the readiest means by which landlords could improve farms for the benefit of their tenants. (A voice—"And their own.") A few weeks ago, in Norfolk, he saw much in their practice which might be useful to him at home. He saw them cultivating land which was naturally poor, and yet raising good crops. He saw stock, some of it brought from this part of the island fed on roots, and by high feeding, taken to market in six months. So much was the cattle improved, that the Norfolk farmers reaped as much in six months as the breeders benefited in a much longer period. It had always been his opinion, that the breeder of cattle should combine the finishing. The London market was principally supplied from Norfolk; and he thought, with the large towns in the west, the breeder there would find it advantageous to fatten the stock he raised, and not sell an animal for 16*l.* to the Norfolk farmer, who in six months would sell it again for 25*l.* The oilcake used in fattening enables the eastern farmer to cultivate a poor soil; and if this was advantageous in a poor soil, it would be even more so in a good soil. The farmers might rely on it, that nothing but their own exertions would take them through times to come; and that whatever reduction the landlords might make in their rents, that alone would not meet the times.—Mr. HOLLAND, of Evesham, deeply felt, in common with all present, the sad winter that was in prospect for the labourer; and he was quite sure that the coming distress of the labourers would touch more deeply and tenderly their feelings, even than it would touch their pockets. But he knew this, that in every great change that took place—and therefore in that which was taking place—the man of the least intellect was he who suffered most. And it appeared to be one of the laws of civilisation—one of the conditions of the advance of the country in intelligence—that those who were lowest in society must suffer in the change. The landlord, who to a certain extent could exert a control over those who employed labourers, as well as over those whom he employed, having the advantage of education, ought to be the most prompt in intellect on these points. These, he was certain, would endeavour to alleviate the condition of the labourer; and although the prospects of pauperism was great, he knew also that where there was good farming, pauperism fell away at the very sight of it. Amongst those reports, the printing of which cost the tax payers of this country so many thousands, without benefit to anybody—amongst those reports he had met with a curious instance of the benefit of good farming in preventing pauperism. It was of a man who went into a particular parish, having purchased a farm in it. He found on taking possession, that the whole of the labourers in the parish were taken into employ man by man, but that most of them were on the rates, and that in fact the farmers were allowed a part of the rates to pay the labourers. This person did not like men so degraded, he did not like these particular men, so he called into the parish 30 additional labourers. There was immediately an outcry amongst the farmers; they declared that the parish was already overburdened with pauperism; they could not get on with things as they were, and yet the new comer was about to increase pauperism. "What," cried they, "shall we do?" This person persisted; he employed all the labourers he had taken on, for he possessed capital, and farmed with judgment in proportion. The labourers on the rates, too, were taken off the rates by his employment, and actually in this very parish—he could name the parish if he could refer to the report, but he could not remember at this moment—the very men who cried out against a superabundance of labourers in the parish were now obliged to import additional labourers. Now if this could be done in one parish, why not in all parishes? But there were certain periods when distress fell on this large interest through the act of Providence; but when distress also arose from want of capital, nothing in the shape of improvement could be made in agriculture, nothing could be done to benefit the position of the labourer without adequate capital being brought into that branch of industry. And, therefore, he suggested, that if Mr. Fulljames had given his 10*l.* as a premium to any gentleman who should produce an animal that could carry the farmer not merely across the country, but through this period of agricultural distress, and land him safely on the other side (laughter), he believed that Mr. Fulljames would not be asked to give it to the general fund. What sort of animal must that be? Why Mr. Long and Mr. Beach said it was the landlord. Now he was willing to do his duty as a landlord, but certainly he was not willing to be the sort of animal which the tenants required. (Laughter.) His duty as a landlord was very simple and plain; it was to make the most of the raw material which belonged to him. He maintained, that if a man had the disposition of any raw material, whether it be capital, manufactured goods, or land, his duty was plain; it was to do what everybody else would do. He would be a very foolish fellow if he did not in as fair a way as possible make the most of that raw material. (Hear.) Now the tenant who worked the soil, in position was something like the manufacturer, as Mr. Beach had very properly told them. Then the question was, were the interests of the producer of the raw material at variance with the interests of the manufacturer of the raw material? For himself, he said they were not; that is, if they went the right way to work; but he contended that they had not done right up to that time. As for the landlord, he said, "I must have game—lots of game; the tenant must not interfere with it. On the other hand, I must have votes at elections. At any rate, I will not say so, because it is contrary to the law of the land. I will not say, then, I will have votes, but I will not give my tenant a long lease or tenure, so that he will lose the capital he has put in the ground, if he is turned off for voting against my interests." Now these matters were considered in farm affairs, they ought to be deferred, for they had nothing to do with the raw material. Well, then came the question, what was to be done with the raw material? The landlord could not take a large estate into his own hands and cultivate it; the landlord, in truth, was more dependent on the tenant than the tenant was on the landlord (hear), because the tenant could always get another landlord, while the landlord would not like to lose a good tenant. (Hear.) Now, it was the interest of the landlord to throw away all care for game and politics, and to get the best tenant he could, and thus get the best price for his land. Now, the meeting might suppose that to get the best price he would put up the land to the best bidder; but no, he would do no such thing. The highest bidder might not be the best man—he might be a man of straw. But if the landlord was determined to take as his tenant only a man of capital, then he was sure that competition would not raise the price of land unduly high, because men of capital would not give more for the rent of the land than would allow a fair return on their capital. Then they had an opportunity of ascertaining what was a fair rent for the land, while there was a capital check against the rent being too high. Now, if the landlord would throw aside all ideas except that of good cultivation—if he were determined simply to have good tenants, and determined to work the land as it ought to be worked—there they had a good competition as to the price of the land, and also a protection against its being more than it ought to be. Then having fixed on the landlord what he ought to do, the next thing to be considered was what the tenant ought to require. If the tenant was a man of capital, he knew what to do in farming, and he hoped none of them would take a farm without capital, and out of the love of farming. The tenant ought never to invest his property in the cultivation of the soil until he had security in the shape of a good long tenure. It was all very well to talk of tenant rights; and those rights were good if the tenant had no lease. If he understood tenant right properly, it was this: if a tenant expended money in the cultivation of the land, and got notice to quit before the capital was exhausted, then he got a return from the landlord for the unexhausted capital on the land. Well and good. Now, in the first instance, he, as a landlord, always liked to try a man to whom he contemplated to grant a lease, because in granting a long lease the landlord made the tenant master of the soil, in a sense of the word. He granted leases for 20 years, and therefore he was never in a hurry to make a bargain with a man, even if he be a man large capital. There, then, tenant right came in very well. In four years he had an opportunity of ascertaining the skill of his tenant; and if they did not like each other, a mutual separation might take place, the capital sunk in the soil might be recovered, and the landlord would have an opportunity of getting another tenant. This showed if he was right, and he could not be wrong, as it was clear—it showed that the landlord and tenant were "in the same boat." He had, indeed, heard it said, "Very true, but the landlord is sitting and the tenant is pulling." (Laughter.) It might be so, as it often was; but it would not be so if the landlord and tenant had a proper agreement. There came the rub. It was all very well to speak in this way. But if things were as they had been, then all that Mr. Beach had said must come home to their hearts. But the agriculturists were in a different case now—they were in a crisis. He spoke now a word at which, according to the rules of the society, he must stop. But nothing of the kind had happened before. They had been working with different expectations, under a series of fluctuations—not knowing their bargains—not liking their bargains—feeling the want of capital—feeling their capital was without security; and the consequence was, that the laws under which this occurred having fallen, this had taken away the present system, and the agriculturists were in a crisis. How were they to get over that crisis? Not by the sacrifice of the tenant, nor by the sacrifice of the landlord. He knew not how other landlords would do, but, for himself, he would make much sacrifice to keep tenants who did their duty to the land, cultivated it properly, spent their capital, and were moved by the spirit of improvement. But, at the same time, he felt that it was his duty to get rid of a man who put his hands in his pockets, and did nothing but cry out against the times, determined to have a reduction of his rent from his landlord—not that it was in his bargain, but simply on account of the hardness of the times. A bargain was a bargain. He gave a tenant 14 years' good or bad times; he never made a reduction; he had not been asked for it, and if he had he should have laughed at the application. The tenants never gave him a higher rent than they had bargained for in good times, and he did not take lower in bad times. Now, if the agriculturists would take care to have such bargains, their future position would be different, and the landlords, if they had tenants who had the means of farming well, by adequate capital, the landlords would be very foolish if they did not give the tenants an ample tenure and full play to their skill and energy.—Mr. BEACH, of Redmarley, said: With regard to what had fallen from Mr. Holland in speaking of the labouring classes, he must say that he did not feel so confident as that gentleman. His remarks were scarcely to the purpose; for he believed there were many parts of the country in which the land was farmed as well as it could be. In his own parish, for instance; and there he was convinced an additional labourer could not be profitably employed on any of the farms. He believed that if all the labourers were employed that could be profitably, there would still be a superabundance of labourers. And then, with regard to draining, it did not always produce greater crops. He had proved it; he had drained and undrained land, lying side by side, and he got as much, by care to the water-courses, from one as he did from the other. ("No, no.") It was wet land; but he would not say it was the case with all land. He was quite sure of this, too—that a great excess of manure would not secure a great crop, even of roots; and he could point out an example of this, even at the present time. Lord Bathurst, who was a good farmer, had a crop of Swedes, and some of them, grown without manure, were as good, if not superior, to those grown on the other side of the hedge, with the best of manure. It was the same with corn. He was quite sure that there was a certain point beyond which they could not put the producing powers of the land; and the more land was forced, the more was it subject to worm and failure. With regard to the tenant, it was the duty of the landlord, tenant, and labourer, to work together. He thought that the social condition of the labourer was not like what it ought to be; the tenant must now descend in his class, for the sake of the labourer, quite as much as the landlord must descend in his class to look after the interests of the tenant. He believed the time was coming, if not come, when they must have a better educated class of labourers, and the labourers now demanded from the farmers that social intercourse which would be beneficial not only to themselves, but to the whole agricultural body. He hoped that henceforth all classes of agriculturists would work together, for it would benefit and advance the interests of the country.—Mr. HOLLAND said he was glad to hear Mr. Beach say he hoped the time would come when there would be a better race of agricultural labourers; for it was time they should have a new race of labourers. There was one thing distressing to those who wished to improve the condition of the labourer—it was their bad situation which prevented improvement. Farmers now seldom received their labourers under their own roofs; and the result was that though the labourer went on very well in his father's house as a boy, yet when he grew up, when he became a labourer, he became one in the way. He ought to sleep in another bed, and he got one. He got a lodging in the village by paying so much a week; but what was this lodging? It was a bed only, and perhaps with two or three other persons sleeping in the same room. Nothing more. What, then, became of the labourers after their work was done? Pass through a village between 8 and 9 o'clock in the evening, and see if they were not loitering in the street, or collected in some bye-place in masses, because they had no roof over their heads, and concocting mischief, or they were in the public-houses, because they found there a good fire and company, and something to employ their minds, which would be employed either for good or evil. The consequence of the want of a home, which the labourers felt, was that adults were in as bad a school as they were 30 years ago. How could it be remedied? The agriculturists could not go to any large expense at present, but still they could remedy this state of things in some manner very inexpensively. There was a schoolroom in almost every parish; and if the landlords and tenants would join in putting in the room a few books, a fire, and an intelligent man to conduct it, which might be done every evening, at a small cost, it would be extremely useful. He believed it, because he had seen it in different places where it had been attempted, and a large amount of good had been done, at a small cost. The man whom they had sent to school as a boy, to learn to read and write, would have an opportunity, at the cost of a few pence a week, of keeping up that knowledge, and of getting a better insight into agriculture; and a man would be so employed, that when he tried it—men being so much under the influence of habit—he would find himself unfitted for the public-house. He would not propose this in public if he thought it was an experiment; but he knew, as a fact, that it had been carried out at a small expense, with great advantage; and, therefore, he thanked Mr. Beach for having given him an opportunity of saying so much. *Abridged from the Gloucester Journal.*

Reviews.

The Stud, for Practical Purposes and Practical Men. By Harry Hieover. Longman, Brown, Green, and Longmans.

WE can recommend to our readers the perusal of this little book. They will find it to contain much useful information, conveyed in an amusing style. Its object does not seem to be so much to specify the good points of an animal, which an intending purchaser should look for, as to enumerate and describe such imperfections as when it is wanted for a given purpose or kind of

employment, may be tolerated, provided it be otherwise of the proper "stamp."

In speaking of broken knees the author gives this advice, "I would advise a buyer not to reject a good horse with good action, if he wants one more for use than show, because he has marked knees. With broken knees and good action the horse may be and most probably would be perfectly safe and pleasant to ride; with bad action and no broken knees he would still more probably be neither safe to ride or even drive." It is to indicate that sort of horse which, without having any *very* imposimg appearance, may nevertheless be called, as he calls it, "A *pretty* good sort for most purposes," that Harry Hieover has written the work. And a very good idea of what he means is conveyed by the figure in the frontispiece, for our author is as skilful in the use of the pencil as in that of the pen. Perhaps more so, indeed; for it is not everyone who will admire the characteristic prolixity and talkativeness of his style, however its peculiarities may ultimately be rendered agreeable by habit. You have in this book the conversation of an intelligent and "chatty" companion, on a subject regarding which he is an undoubted authority.

TABLE, showing the Consumption of Food and the Increase of Animal per week, for each 100 lbs. Live Weight, as recorded by various observers.

Calendar of Operations.

JANUARY.

Few Farm, *Jan.* 5.—The stock of manure increases as the straw disappears. Beasts tied up or in boxes, consuming hay or chaff, Turnips, and Linseed cake, at 8*l.* per ton, meal or compound, produce the best and the greatest quantity of manure; this is carted from time to time to a large heap forming in the future Turnip field; last week we cleared the stable yard, partly on to the same heap, and the remainder near a tank, to be well soaked by liquid manure; the daily sollings from a stalled stable, from a shed of 4 or 5 stalled cows, and the pigsties are also mixed together, in square heaps, in the yard or field, 5 or 6 feet high, and twice or thrice that measure in length and breadth; these are well sluiced by all the disposable liquid, and in all cases covered in the yard with road mortar, and in the field with soil cast from a trench dug deep on the sides. These heaps are formed in the field at some distance from the fence, on any ridge or hill, so that when distributed over the piece, a spit may be taken from under the heap, which would otherwise be too rich; and it makes a better dressing than half the manure so called. It is customary with some to cart their muck into a road or corner near its destination, time after time, at a considerable waste of its most valuable contents, as seen by the rank growth of Thistles and Nettles hard by, as well as by the black colour of the bed, too strong to grow anything. Some farmers have a plan of accommodating their town friends with straw, receiving the manure made in the stable in return; if the dung-heap was managed carefully this would be a fair bargain, but the litter of nine stables out of ten at least is cast into a great bulk and overheated before removal, so that it is not of so much use for land as the straw alone would have been, if cut into chaff, instead of being carted to the town, and brought back inert and valueless; if not convenient to preserve in a thin layer, or kept moistened with animalised fluid, it should, if intended for any useful purpose, be removed at short intervals, or as soon as a cart-load or so had accumulated. When manure from a variety of animals is mixed together, there is not much danger of its being "fire-fanged;" but if there is a tendency to heat to a dry mould, it may be easily repressed by the aid of the indispeneable tank, or a few barrowsful of road mortar, which should always be at hand for that purpose; if road scrapings are not to be procured easily, the boasted compost may be turned to account, taking care that it be not too foul with seeds and live roots of weeds, of which hedge bottoms are generally composed. Another resource for adding to the efficacy of manure, and mixing with it, is the clean clay, sand or marl, excavated in deepening an outfall, or removing a bank, observing to put any large quantity of such materials on land having a subsoil of a different character, as gravel or clay on a field lying over limestone, marl, or chalk; or sand on clay, &c.; by which means the fertility may be very greatly increased. Caution is, however, required, as a person heavily clayed some land at Deeping, at a considerable expense, and spoiled his field, the clay being of a very hungry nature, and moderate productiveness was only recovered after a lapse of several years, by deep cultivation, and at a disproportionate cost. "Claying" is carried on extensively in the Fens, by deep trenches being opened at intervals, and the clay found at depths varying from 3 feet to 7 or 8, is cast out on each side; when this operation is performed properly, it is of surprising benefit, making the light, fuzzy, black soil of a solid texture, and capable of sustaining heavy crops of fine grain. Last week I took advantage of the frost to cart a large quantity of clay, taken from a dike, a distance of two miles, upon a low place in Borofen. *J. W., Peterborough.*

Notices to Correspondents.

Arsenic: *A Correspondent* enquires as to the quantity and mode of application of arsenic as a pickle for Wheat seed. I have used nothing else for the last 4 or 5 years, and during that period have almost entirely escaped "smut," which previously I had in abundance. Its cost is very trifling, and after all that has been said against it, on the score of poultry and game, it is in my experience absolutely safe. Besides, its use is particularly cleanly. I prefer it upon comparison, and in the order, to sulphate of copper, brine and lime, and chamber-lye. I allow 2 oz. of arsenic to a bushel of Wheat. If purposing to begin drilling on Tuesday morning, prepare a bag (3 bushels) on Monday evening. Dissolve 6 oz. of arsenic in a quart or two of boiling water; pour this into a watering-can, containing a gallon of soft water, and stirring it up briskly every minute or two (or the arsenic may settle); rain the mixture gradually over the Wheat, lying meanwhile thinly on a stone floor; turn backwards and forwards five or six times with a shovel, till every corn is well wetted, and then leave for the night in a close heap on the floor. The first thing in the morning prepare another bag in the same manner, and this quantity (6 bushels), at 6 or 7 pecks to the acre, will suffice for a day's drilling. Should rain delay the drilling, spread thinly, the Wheat will take no harm. I use no line. My drill is a 3-rowed bowl drill, and the best I am acquainted with for the small farmer. Price (without a manure hopper), 5*l.*; maker, Hemming, Dunnington, 7 miles from Evesham. I trust the above account may prove sufficiently intelligible. In practice the plan is highly satisfactory. *J. B., I. N.* [Many thanks.]

Coloured Yolks: *Philanax.* In answer to "Philanax's" inquiry, I beg to state that a fowl of mine laid about eight eggs of the same description, and I ascertained that she had been kicked, and the yolks in the egg-bag injured thereby—a practice not at all uncommon among servants when the poultry annoy them by continually being about the kitchen door. *Nomen fictitium.*

Emigration: *Falcon.* It is in type.

Ewes on Turnips: *E T W.* There is, and ever will be, a great risk in putting breeding ewes on Turnips. The amount of the danger depends entirely on the wetness of the autumn and winter, and therefore in districts liable to a great fall of rain, the risk is greater than in drier localities, a less quantity of moisture being taken into the system. Where pasturage is very short, the best plan is to take care that the lambs fall very early; horned ewes will lamb many weeks before Christmas, and forward Down ewes soon after. The Turnips may, therefore, be reserved till after this period, or they may be pulled and given sparingly on the pastures, or the ewes may follow after other sheep on Turnips, taking care, however, that they are only so folded for a certain portion of the 24 hours. *W C S.*

Mummy Wheat: *J G.* Did you apply for any. Give us your *experience* of any fraud on the part of the advertiser, and we will publish it.

Oilcake: *W B.* Can any one state his *experience* of the superiority of English oilcake to foreign.

Pigeons: *A Constant Reader* asks the name of the best practical book on pigeons.

Rats: *J G N.* See a shilling book by H. D. Richardson—M'Glashan, Dublin.

Water: *N.* If they will drink it they may have it; but it is better to slake their thirst by giving them Turnips enough.

Markets.

COVENT GARDEN, Jan. 12.

Notwithstanding the severity of the weather the supply of Vegetables has been pretty well kept up. Fruit, too, is for the most part sufficient for the demand. Hothouse Grapes and Pine-apples are good for the season, Filberts and Walnuts are abundant, and Chestnuts plentiful. Oranges and Lemons are abundant, and there are some Seville Oranges in the market, but they are very dear and not good. Table Pears are scarce. Amongst Vegetables, Turnips are good and plentiful; Carrots the same. Cauliflowers and Broccoli are rather scarce and dear. Potatoes have not altered since our last account. Lettuces and other salading are plentiful. No alteration in the price of Mushrooms. Some Asparagus, Seakale, and Rhubarb may be obtained. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Chrysanthemums, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

FRUITS.

Pine-apples, per lb., 5s to 8s	Oranges, per 100, 5s to 12s
Grapes, hothouse, p. lb., 3s to 6s	Almonds, per peck, 6s
— Portugal, per lb., 9d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 2s to 4s	Walnuts, p. 100, 1s 6d to 2s
— per half sieve, 8s to 12s	— p. bush., 16s to 24s
Apples, kitchen, p. bsh., 2s to 4s	Filberts, per 100 lbs., 60s to 65s
Lemons, per doz., 1s to 2s	Nuts, Bar., p. bush., 20s to 27s
— per 100, 6s to 12s	— Brazil, p. bsh., 12s to 16s
Oranges, per doz., 9d to 1s 6d	Kent Cobs, 60s to 65s p. 100 lbs.

VEGETABLES.

Seakale, per punnet, 2s to 3s	Spinach p. sieve, 2s to 3s
Asparagus, per bundle, 4s to 6s	Onions, p. bushel, 3s to 4s
Rhubarb, p. bundle, 1s 6d to 2s	— Spanish, p. doz., 1s 6d to 4s
Cabbages, p. doz., 6d to 9d	Shallots, per lb., 4d to 8d
Cauliflowers, p. doz., 6s to 9s	Garlic, per lb., 4d to 8d
Broccoli, p. doz. bundl., 18s to 24s	Lettuce, Cab., p. sc., 4d to 9d
Greens, per doz., 2s 6d to 3s	— Cos, do., 6d to 1s
Brussels Sprouts, p. hf. sieve, 1s 6d to 2s	Endive, per score, 1s 6d to 2s
Sorrel, p. hf. sieve, 6d to 9d	Mushrooms, p. pot., 1s to 1s 3d
Potatoes, per ton, 60s to 100s	Small Salads, per punnet, 2d to 3d
— per cwt., 3s to 6s	Watercress, p. 12 bun., 4d to 6d
— per bush., 2s to 3s	Fennel, per bunch, 2d to 3d
Turnips, p. doz. bun., 1s 6d to 2s 6d	Savory, per bunch, 2d to 3d
Red Beet, per doz., 1s to 2s	Thyme, per bunch, 2d to 3d
Horse Radish, p. bdl., 2s to 4s	Parsley, p. doz. bun., 3s to 4s
Cucumbers, each, 3s to 3s 6d	— Roots, p. bdle., 1s to 1s
Leeks, per bunch, 2d	Marjoram, per bunch, 2d
Celery, p. bundle, 8d to 1s 3d	Mint, per bunch, 2d
Radishes, p. 12 hands, 1s to 2s	Basil, per bunch, 2d
Carrots, per bun., 4d to 6d

Old Clover	80 85			

HOPS.—Friday, Jan. 11.

Messrs. Pattenden and Smith report that there is a little more demand for all kinds of Hops with colour and quality.

SMITHFIELD, Monday, Jan. 7.

The number of Beasts is not so large, but the demand being very small, trade is slow. The best qualities are pretty freely purchased at late rates. There are many more Sheep than on Monday last, still the supply cannot be called excessive; the choicest Downs are selling briskly, but other kinds meet with a dull trade. There are very few Calves, and veal is consequently dearer. From Holland and Germany we have 86 Beasts; from Spain, 48; from Scotland, 60; from Norfolk and Suffolk, 1200; and 1000 from Leicester and Northampton.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	4	0 to 4	2	
Best Short-horns	3	8 — 3	10	
2d quality Beasts	2	8 — 3	4	
Best Downs and Half-breds	4	0 — 4	4	
Ditto Shorn	...	...	...	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	6 to 3	10	
Ditto Shorn	...	...	...	
Ewes & 2d quality	3	0 — 3	4	
Ditto Shorn	...	...	...	
Lambs	...	...	...	...
Calves	...	...	3	8 — 4 0
Pigs	...	...	3	4 — 4 4

Beasts, 3070; Sheep and Lambs, 21,630; Calves, 34; Pigs, 206.

Friday, Jan. 11.

The number of Beasts is not large, but the demand is smaller. Trade is very slow at a reduction of fully 2d. per 8 lbs. The supply of Sheep is small, about, however, as usual at this time of year. Buyers are very scarce, and a clearance cannot be effected at lower rates. We have more Calves; they meet with a slow sale at 4d. per 8 lbs. lower. From Holland and Germany there are 141 Beasts, 340 Sheep, and 121 Calves; from Scotland, 140 Beasts; and 125 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	10 to 4	0	Best Long-wools	3	6 to 3 8
Best Short-horns	3	6 — 3	8	Ditto Shorn	...	... — ...
2d quality Beasts	2	6 — 3	2	Ewes & 2d quality	2	10 — 3 2
Best Downs and Half-breds	4	0 — 4	2	Ditto Shorn	...	... ...
Ditto Shorn	...	... —	...	Lambs	...	... ...
				Calves	...	... ... 3 6 — 4 2
				Pigs	...	... ... 3 4 — 4 4

Beasts, 693; Sheep and Lambs, 3560; Calves, 225; Pigs, 220.

POTATOES.—Southwark, Jan. 7.

The Committee report that the arrivals since our last report have been moderate, which, with cold weather, have enabled salesmen to clear out most of the heavy arrivals the preceding week without storing. The supply of the best Yorkshire Regents is moderate, consequently they make a high price. The following are this day's quotations:—Yorkshire Regents, 70s. to 120s. per ton; Wisbeach do., 60s. to 70s.; Scotch do., 60s. to 70s.; Scotch cups, 50s. to 60s.; French whites, 65s. to 70s.; Rhenish and Belgian do., 60s. to 65s.

MARK LANE.

Monday, Jan. 7.—Although the supply of English Wheat by land carriage samples was moderate this morning, it met a slow sale at the prices of this day se'nnight, and several stands were not cleared at a late hour. Owing to a large arrival of Flour, millers abstained from purchasing foreign, and the trade was exceedingly limited at late rates.—Barley, Beans, and Peas were each a heavy sale, but we do not alter our quotations.—Business in Oats was quite of a retail character; Scotch were the turn cheaper.

Friday, Jan. 11.—The arrivals of grain during the week have been moderate, and this morning's market being badly attended, business in all articles was very limited. A portion of the English Wheat left over from Monday remained unsold at a late hour, that day's rates being unobtainable. Foreign is nominal at our quotations, neither do we observe any alteration in the value of spring corn.—Indian Corn is neglected, floating cargoes being purchasable at a trifling reduction.—The firmness we had to report on the 4th inst. has been succeeded by great languor throughout the English markets for all descriptions of grain. Business has been very limited, and a decline of 1s. per qr. submitted to in many instances. In New York, on the 26th Dec., the prices of Flour were unaltered, and shipments confined to Canadian.

Arrivals this week.

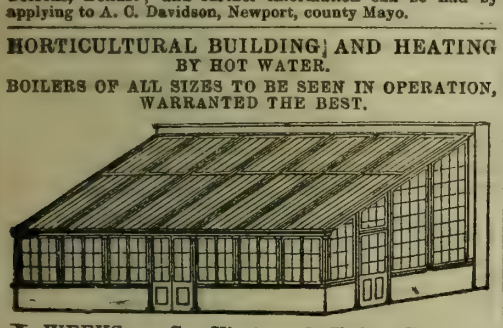
Liverpool, Tuesday, Jan. 8.—The week's imports of Wheat, Flour, Oats, and Oatmeal from Ireland are to a fair extent. The improved tone in our trade observed on Friday was not supported to-day, and the business transacted was limited. Wheat, Flour, Beans, and Indian Corn were the turn lower. Oats were fully as dear. Barley and Peas unaltered.



FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, January 21, 1850, at 2 o'clock precisely, about 1700 tons of damaged PERUVIAN GUANO, in Warehouse, ex sundry ships, by order of Messrs. Anthony Gibbs and Sons, the Importers.—Catalogues and further particulars in due time from Messrs. J. A. RUCKER and BANCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

TO BE LET, a good ARABLE FARM, of 700 acres, in Hampshire, with immediate Possession. It is within three miles of a railway station, and at an easy distance from Basingstoke, Andover, and Newbury Markets. Rent moderate, tithe and rates very low. For particulars, apply by letter (stating the experience and capital of the applicant), to X. Y. Z., care of George Lamb, Esq., Basingstoke, Hants.

PARTNERSHIP.—To FARMERS.—The Advertiser, who has been settled in the West of Ireland for nearly two years, on a farm of about 800 acres arable land, a good Barley soil, and about 7000 acres mountain pasture (which affords good grazing), is anxious to meet with a suitable PARTNER, having a ready-money capital of not less than 1500*l.* or 2000*l.* The farm is held on lease of three lives, or 31 years, under an improving and popular landlord at a yearly rent of 480*l.* The poor-rates on the farm have never exceeded 4*5.* per annum, payable by the tenant; and from measures now in progress in the district, is likely to be reduced to half that amount. A sum of upwards of 3000*l.* has been expended by the advertiser in draining, fencing, and other permanent improvements, including farm-buildings and cattle-sheds. The people are exceedingly peaceable and well disposed. Labourers' wages from 6*d.* to 8*d.* per day, depending on the season. The farm being close to the sea, grain can be delivered in a neighbouring market town at 1*s.* 6*d.* per ton, and in Glasgow, Liverpool, or Gloucester, at from 8*s.* to 12*s.* a ton. There is also a large quantity of seaweed available for manure, and limestone can be had on the premises at 1*s.* per ton, and an abundant supply of fuel. The quantity of land under tillage during the past year was about 500 acres.—References can be made to Messrs. King, Melville, and Co., corn-factors, London; Messrs. J. and C. Sturge, merchants, Birmingham and Gloucester; Messrs. Richardson, Brothers, and Co., Liverpool; Messrs. John M'Call and Co., merchants, Glasgow; Messrs. Redpath, Browne, and Co., Edinburgh; Messrs. Davidson and Torrens, Belfast; and further information can be had by applying to A. C. Davidson, Newport, county Mayo.

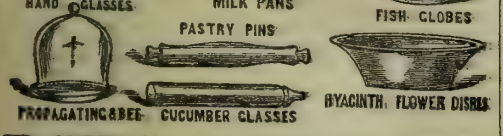
HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 130 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.
J. WEEKS and Co., King's-road, Chelsea.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.
Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.



GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 18, Leicester-square, London.

GLASS FOR CONSERVATORIES AND HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅜ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s* 6*d.* each. Wasp Traps.—Lists may be had on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
London, January 12.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

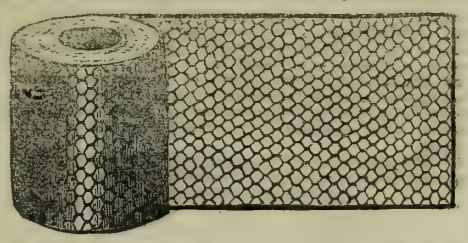
IMPROVED FOUR-HORSE PORTABLE STEAM-ENGINES AND BOLTING OR THRESHING MACHINES.

FREEMAN ROE AND HANSON, Southwark Iron Works, and 70, Strand, beg to call attention to their Steam-Engines and Threshing Machines, which are more economical in fuel, for the quantity of work done, than any before the public. They may be seen any day at their works, Sumner-street, Southwark Bridge-road.—Water-rams for raising Water. Deep Well Pumps; Baths; Hot-water Apparatus; Fountains. Towns supplied with Gas or Water.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower Stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS on improved and economical principles.

Parties waited on in Town and Country, and Drawings and Estimates free. Work for the Trade as usual.
Ward's Cases, or Domestic Greenhouses.



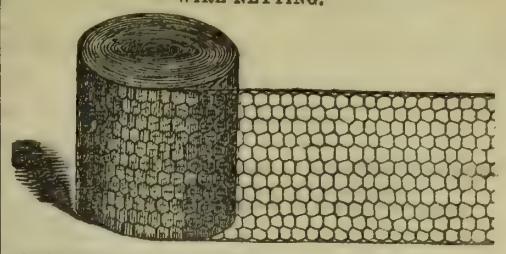
HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY, and Make the Animal look Better than when Paying 12*s.* and 14*s.* per Week.—Consider the enormous saving in these hard times—times of cheapness.—Apply personally or by letter at MARY WEDLAKE and Co's, 118, Fenchurch-street, Oat-bruising and Chaff-machine Manufactory, established upwards of 40 years.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

DRAINAGE OF ESTATES.

ALFRED TUCKETT, having had considerable experience in Draining Land, more particularly on heavy wet clays, and being a manufacturer of very superior Drain Pipes and Tiles, offers his services as CONTRACTOR FOR THE DRAINAGE OF ESTATES. All contracts undertaken by A. TUCKETT will have his own personal superintendence, and from his thorough knowledge of such work, he feels confident that he can execute it to any extent, and at such a moderate cost, that the interest will be cheerfully paid by tenants.
Warmley, near Bristol.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWOPENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard	30 inches wide	7½*d.* per yard
18 " "	4½*d.* "	36 " "	9*d.* "
14 " "	6*d.* "	48 " "	1*s.* "

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

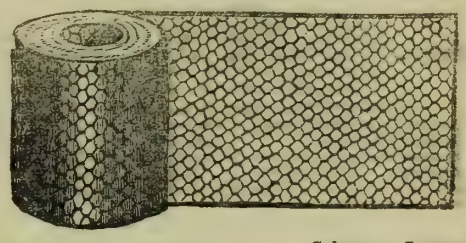
CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c., 22, PARLIAMENT-STREET, WESTMINSTER, LONDON; CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL; 128, HIGH-STREET, EDINBURGH; and 32, ST. ENOCH-SQUARE, GLASGOW, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	.. 5 0 0
Do. of 100 yards, 30 ins. wide	..	.. 6 5 0
Do. of 100 yards, 36 ins. wide	..	.. 7 10 0



If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.
Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.—Direct to JOHN LEGG, Cheltenham.

DIETETIC COCOA.

HOMŒOPATHIC PATIENTS, DYSPEPTICS, and Persons of Delicate Constitutions, are strongly recommended to use TAYLOR BROTHERS' DIETETIC COCOA, as being very superior to any preparation of the Cocoa Nut hitherto introduced. This article is manufactured on a peculiar principle, by which the oily portions of the nut are neutralised, at the same time its flavour, purity, and nutritious properties are maintained. It is an essential article of diet for those under Homœopathic Treatment, agrees with the most delicate digestive organs, is agreeable and soothing to the nervous system, and proves at the same time both invigorating and refreshing.

Sold wholesale by TAYLOR Brothers, at their Mills, Spitalfields, London, and retail, in 1 lb., ½ lb., and ¼ lb. tin-foil packets, at 1*s.* 4*d.* per lb., by most respectable Grocers and Tea-dealers in the kingdom; of whom also may be had TAYLOR Brothers' original SOLUBLE COCOA (only one-third the price of Coffee), the consumption of which article exceeds ONE MILLION POUNDS per annum—a fact which has induced many parties to manufacture spurious imitations, which, although somewhat resembling the appearance, are totally devoid of the essential and peculiar properties of the original and only genuine article. To guard against these counterfeits, TAYLOR Brothers recommend the purchase of their article in packets only which bear their name, with directions for use. Sold by all Grocers and Tea-dealers.

NEW PERIODICAL.

In Weekly Numbers, price Sixpence, each Number illustrated with a beautifully coloured Plate,

THE GARDENERS' MAGAZINE OF BOTANY,

HORTICULTURE, FLORICULTURE, AND NATURAL SCIENCE.

CONDUCTED BY

THOMAS MOORE, F.B.S., Curator of the Botanic Garden, Chelsea, and WILLIAM P. AYRES, C.M.H.S., Blackheath, Kent

WHAT IS CALLED FREE TRADE
ON
BRITISH AGRICULTURE,

and the CLASSES DEPENDENT UPON IT, as well as on the GENERAL PROSPERITY of the EMPIRE.

By DAVID LOW, Esq., F.R.S.E.,
Professor of Agriculture in the University of Edinburgh.

WILLIAM BLACKWOOD and SONS, Edinburgh and London.

LONDON COMMITTEE FOR REPEAL OF THE ADVERTISEMENT DUTY.

Offices, 16, Salisbury-street, Strand, London.

COMMITTEE.

Chairman—PETER BORTHWICK, Esq., Morning Post.

- G. F. Smith, Esq, Daily News
- R. Souter, Esq, Morning Advertiser
- J. Francis, Esq., Athenæum
- D. Pratt, Esq., Patriot and the Banner
- James Ponsford, Esq., Railway Times
- J. P. Pittman, Esq., County Chronicle
- E. Miall, Esq., Nonconformist
- J. Matthews, Esq, Gardeners' Chronicle
- John Cassell, Esq., Standard of Freedom
- H. Ingram, Esq, Illustrated News
- F. G. Tomlins, Esq., Jerrold's News
- J. Smith, Esq., Commercial Daily List.

Treasurer—William R. Spicer, Esq., New Bridge-street.

During the late session of Parliament several Meetings of the Committee were held for the purpose of considering the best means of effecting the abolition of the Advertisement and Paper Duties. After an interview with the Chancellor of the Exchequer on the subject, the Committee, upon mature deliberation, resolved to confine the present effort exclusively to the abolition of the Advertisement Tax, believing that to include the Paper Duty would endanger the success of both measures, while a reasonable hope exists that an energetic effort for the repeal of the Advertisement Duty alone will, during the coming session of Parliament, be attended with success—a result that would enable the Committee to concentrate its energies for effecting the future removal of the remaining impost.

The injurious effects of the Advertisement Duty upon trade and labour seeking a market through newspaper publicity are so disproportionate to the amount of revenue derivable from the impost—about 150,000*l.* per annum—that a wise Government would gladly forego so inconsiderable a source of income in consideration of the national benefits arising from its abolition. To enforce this view of the subject on the attention of the Government will be an especial object of the Committee.

The almost unanimous combination of the metropolitan press for the abolition of the advertisement duty will, when assisted by the powerful aid of its provincial contemporaries, offer an agency so efficient for the end sought to be attained, that success can scarcely fail to repay an earnest and well-organised effort.

The Committee have reason to anticipate that a moderate subscription from such of the provincial journals as are in favour of the movement will, with the amount subscribed by the metropolitan press, be sufficient to cover the expenses attendant on the prosecution of the proposed object. Such subscriptions are therefore solicited by the Committee, to be made payable from the editor or proprietor of the subscribing journal to the Honorary Secretary, by Post-office order, receivable at Charing-cross, London.

All resolutions and documents of importance emanating from the Committee will be forwarded to the editors of newspapers favourable to the movement, in order to effect that unity of action so necessary in extended operations to ensure success.

*** The proprietors of the provincial journals are respectfully requested to give publicity to this advertisement.

By order of the Committee,

January, 1850. THOMAS M'ENTEER, Hon. Secretary.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box. CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

COLE'S SUPERB DWARF RED CELERY.

WM. PORT AYRES begs to inform his friends and the public that he can supply the above SEED of his own growth, in sealed packets, with "Directions for Cultivation," at 1*s.* each. This Celery may also be had genuine of the following Seedsmen, &c.:

- Warner, Cornhill

MYATT'S LINNÆUS RHUBARB.

J. MYATT AND SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1*s.* 6*d.*; ditto, Mitchell's Royal Albert, 1*s.* 6*d.*; Victoria, 9*d.* The usual Trade allowance.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford.—Jan. 19.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall, and are warranted double, and of which large and choice roots are selected at 4*s.* per dozen. Also, expected, about the end of January, a choice collection of Orange, Lemon, Citron, and Shaddock Trees, together with Catalonian, Azorian, and Arabian Jessamine plants, any of which may be bespoke.—N.B. Orders by post punctually attended to.

CLERODENDRON BETHUNEANUM.

HUGH LOW AND Co. have much pleasure in offering the above-named most beautiful plant. It was introduced by them from Borneo, and is figured and described by Sir Wm. J. Hooker in the December Number of the Botanical Magazine. Strong established plants, 63*s.* each. A Catalogue of their general collection, stamped, and free by post; also a list of Vegetable and Flower Seeds, containing the best and most approved varieties, may be had on application.
Clapton Nursery, London, Jan. 12.

NEW DARK FUCHSIA, "SIR JOHN FALSTAFF."

C. TURNER intends sending out this approved noble variety in spring. For price, &c., see Catalogue, which will be ready in January.—Royal Nursery, Slough.

FOR SALE, Two Millions of SEEDLING THORNS, at 10*d.* and 2*s.* 6*d.* per 1000, or the lot for 160*l.* Samples sent on application to W. H. CHRISTOPHER, Tadcaster.

CHEAP! CHEAP!! CHEAP!!!

CHARLES DALY AND SON beg to refer their friends and the public, who should be in want of cheap Thorn Quick, cheap Irish Yews, cheap Shrubs, cheap Forest Trees, and cheap Early Seed Potatoes at 5*s.* per bushel, to their Advertisement in the *Gardeners' Chronicle* of the 27th of October, and 3d and 10th of November last. Their Catalogue of Garden and Farming Seeds sent free by post, containing a good many of their own growing, which will be seen by their Advertisement.
They will also feel much obliged by their customers paying their last year's account, as they have no wish to put them to expense.—Coleraine, Ireland, Jan. 17.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2 feet, is 3 weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5*s.* per quart.
BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetar's, and 20 to 24 per stem. 2*s.* per quart.
BURBIGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s.* per quart.
The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.
Catalogues can be furnished on application, and every article connected with the trade supplied on terms to defy competition. Garden Tools, Nets, Mats, Mushroom Spawn, and Potatoes saved from selected stocks at moderate prices.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.

No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a noblemau's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz. Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pints Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. ... £3 3 0
No. 2, two-thirds of the above ... 2 2 0
No. 3, one-third ditto ... 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden ... 0 12 6
The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.
*** Cole's Superb Dwarf Red Celery, 1*s.* per packet.

AMERICAN PLANTS.

GEORGE BAKER begs to inform the gentry and public he has published a NEW CATALOGUE of his AMERICAN AND CONIFEROUS PLANTS, &c., and may be had on application.—Windlesham Nursery, Bagshot, Surrey.

DAHLIAS.

CHARLES TURNER has much pleasure in offering the following beautiful new DAHLIAS, plants of which will be ready in May next.
QUEEN OF THE ISLES (Skynner).—White, distinctly tipped with deep crimson, very striking and beautiful; the petals being smooth and well arranged. It was exhibited at Cambridge and Norwich, 12 blooms on each occasion, and received the highest award and commendation. Warranted the finest Dahlia ever offered by C. TURNER. 3 to 4 feet—10*s.* 6*d.*
MRS. SELDON (Turner).—Bright pure yellow, good petal, flower very circular and full size, extra fine. It was awarded a first-class Certificate at Birmingham for six blooms; the only place exhibited at, the stock being short. 5 feet—10*s.* 6*d.*
THAMES BANK HERO (Robinson).—Deep crimson, full size and constant, good form. 4 feet—10*s.* 6*d.*
SERAPH (Fellows.)—Bright novel orange, compact, fine form, a very constant flower for exhibition. Received first class Certificate at Norwich. 3 feet—10*s.* 6*d.*
DUKE OF CAMBRIDGE (Fellows).—Silvery lilac, very constant, and good habit. 3 feet—7*s.* 6*d.*
QUEEN OF LILACS (Turner).—Pale lilac, full size, fine form, and noble show flower. 4 feet—7*s.* 6*d.*
UNIQUE (Turner).—Fancy, dull red with white tip, a fine form. 2 to 3 feet—7*s.* 6*d.*
MRS. LABOUCHERE (Turner).—Fancy, scarlet, white tip, a sweet variety; being very bright, constant, and not more than 18 inches high. 7*s.* 6*d.*
PURITY (Turner).—The finest white raised, when caught very beautiful, but being uncertain will not be charged for. Purchasers of the others may have plants gratis.
A Descriptive Catalogue ready in January, comprising all the novelties.—Royal Nursery, Slough.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to offer the following new PEARS, which will be found faithfully to answer the description given of each, they having been tried and proved these last five years:
BEURRE ST. HELIER.—Ripens February and March; large, brown, melting, first quality; trees vigorous. Will do well as a pyramid or on a wall; all the trees are not less than two years old; fine strong, on Quince stocks, 10*s.* 6*d.*
BEURRE DELAVAL.—Ripens November and December; fine waxy colour, size of a large Crassane, melting, excellent; pyramid or north-west wall will suit it well. Most of the trees are in a bearing state; stock limited. 10*s.* 6*d.*
GABOURELLE'S SEEDLING.—Round kitchen fruit, the greatest bearer of Pear trees. Ripens December and January; well adapted for orchards, for which the trees are principally trained, and are very vigorous; from 6*s.* to 7*s.* 6*d.*
R. L. regrets that the following should have been omitted in the printing of his Descriptive Catalogue, but they will be found excellent and melting, *viz.*, LANGELIER'S BEURRE and BEURRE LEON DE CLERC. Those who may have received them, may be assured they are of first-rate quality; so is GROSSE CALEBASH. Having a large stock of superior grown trees, on Quince stocks, all grown and proved by R. L., he has been induced to reduce his price as follows, if the selection is left to him; none but the best melting sorts will be sent, and he will be responsible for their accuracy. Baking or kitchen Pear, is desirable, as a melting sort, being so useful for a family.
24 trees of best melting, strong and healthy, one of each ... 36*s.*
24 do., one of each, from 3 to 4 years old, both Quince and own stock ... 48*s.*
24 do., bearing trees ... 60*s.*
50 do., large, not less than 4 or 5 years old ... 70*s.*
50 do., larger, well grown and fine ... 90*s.*
50 do., very large ... 125*s.*
The trade supplied with any quantity at per 100 or per 1000.
R. L. will supply from 200 sorts and upwards, only one of each, first quality, at 10*l.* per 100; many will be in a bearing state.
Application to be made to Messrs. PIPER, 23, Paternoster-row, London, for the Descriptive Catalogue. Fine Camellia stocks for grafting or planting in shrubberies, where they do well, from 40*s.* to 50*s.* per 100; also a superb collection, all strong and healthy, of which a Catalogue will be published separately, as well as Vines, of which R. L. possesses an extensive and select collection, also proved by him. A remittance or reference from unknown correspondents.

GARDENERS' BENEVOLENT INSTITUTION.—At a General Meeting of the Subscribers to this Institution, held on Wednesday last, 16th inst., at the London Coffee-house, Ludgate-hill, for the purpose of electing TWO PENSIONERS on the Funds of this Charity, the following was the result of the Ballot:

Name.	Residence.	Applic.	Age.	Votes.
EDW. MARSHALL	London	8th	70	115
MARY BROWNE	Do.	6th	84	483
JOHN SKEATES	Brixton	6th	70	20
THOMAS MILLS	Dulwich	5th	72	220
JOHN APPLEBY	Clapham	4th	57	71
ROBERT DUNCAN	Highgate	4th	70	414
JAMES BATTEY	Chelsea	3d	66	76
EDWARD BEACH	Quedgley, Gloucester	3d	75	169
JOHN COCKS	Brixton	3d	63	159
RICH. RUDLAND	Sutton-at-Hone, Dartford	3d	77	76
JOHN SHEPHERD	Clapham	3d	71	389
WILLIAM BROWN	Andover	2d	71	7
RICE EVANS	Stone, Staffordshire	2d	71	22
JOHN HURDEN	Bath	2d	65	9
CORN. ROBINSON	Greenwich	2d	70	55
JOHN SNOW	Farnborough	2d	65	81
THOS. FITZGERALD	Fulham	1st	64	76
JOHN HOPKINS	Nuneaton, Warwickshire	1st	63	9
HENRY SCHNEIDER	Colerne, Wiltshire	1st	84	54

The Meeting then declared Mary Browne, of London, and Robert Duncan, of Highgate, as having the greatest number of Votes, duly elected Pensioners of this Charity.
EDW. R. CUTLER, Secretary,
January 19. 97, Farringdon-street.

BASS AND BROWN'S SEED AND PLANT LIST, stamped to go free by post. Copies forwarded to any address. — The above comprises their General Descriptive priced Spring Catalogue, in which will be found a rich assortment of the newest and best articles that can be procured.
PART 1 contains Lists of new and choice FLOWER AND VEGETABLE SEEDS. The Flower Seeds are in five divisions, Hardy, Half-hardy, and Tender Annuals; and Hardy and Greenhouse Perennials; descriptive of colours, heights, prices, &c.; prefaced by a page of useful Remarks on Sowing and Raising Seeds, with allusions to such as require peculiar care. The Vegetable List contains the time of sowing each description of Seed, giving heights of Peas, and a variety of other useful information.
PART 2. ROOTS, FRUITS, AND BULBS, consisting chiefly of a selection from their Autumn Catalogue of such as are required for spring planting.
Part 3. A descriptive priced List of Geraniums, Fuchsias, Dahlias, Petunias, Verbenas, Chrysanthemums, Cinerarias, Achimenes, Gloxinias, Azalea indica, Stove and Greenhouse Plants, and a variety of Bedding and other Miscellaneous Plants.
PART 4. NEW PLANTS OF 1850, to be sent out in the Spring, consisting of Petunias, Fuchsias, Verbenas, Dahlias, &c.
A separate List of Agricultural Seeds.
Seed and Horticultural Establishment, Sudbury, Suffolk.

SAMUEL FINNEY AND CO.'S NEW CATALOGUE OF SEEDS will be ready in a few days, and forwarded gratis on the receipt of two penny stamps for postage. In forming our Collections of Seeds we have taken special care to include all the select and most approved kinds, and such as we can confidently recommend.
Of VEGETABLE SEEDS, our Collections contain a full supply of all that is requisite for the largest establishment, and the kinds and quantities for each collection are stated. No. 1, 2*l.* 10*s.*; No. 2, 1*l.* 10*s.*; No. 3, 1*l.*; and No. 4, 12*s.* 6*d.*
Of FLOWER SEEDS, we have included all the most choice and showy kinds, particularly those we know to succeed well in the north, and a full list of all the best kinds of German Seeds, imported direct in sealed packets, with prices.
A Collection of 100 packets of the best hardy and half-hardy kinds for ... 15*s.* 0*d.*
Ditto of 50 ditto ditto ditto ... 8 0
Ditto of 25 ditto ditto ditto ... 5 0
We particularly recommend this Catalogue to residents in the north, as they will be enabled to purchase to advantage. All orders delivered free of carriage at any of the railway stations between Newcastle and York, Berwick and Carlisle, and by steam-boat to London, Hull, Whitby, Leith, Dundee, and Aberdeen. Railway and water communication to all parts of the kingdom.
SAMUEL FINNEY and Co., Gateshead, near Newcastle-on-Tyne.

PLANTING SEASON.

ALFRED BALSTON begs to inform planters he has still a large proportion of his Nursery Stock to dispose of, which, in consequence of having relinquished the trade, he offers at very reduced prices. The Stock comprises every variety of ORNAMENTAL, FRUIT, and FOREST TREES, and all the best kind of SHRUBS in cultivation, no expence having been spared in the collection, and from the light nature of the soil in which it has grown, the plants have all a mass of fibrous root, which causes them to grow most luxuriantly after being transplanted.
A.B. particularly recommends the following: Common Laurel, 9 inches to 1 foot, 15*s.*; 1 to 2 feet, 30*s.*; 2 to 4 feet, 40*s.*; 4 to 6 feet, 80*s.* per 1000. Portugal Laurels, 1 to 2 feet, 10*s.* per 100. Rhododendron ponticum, 1 to 2 feet, 30*s.*; 3 to 4 feet, 60*s.*; 4 to 5 feet, 100*s.* per 100. Ghent Azaleas of all the finest kinds, specimen plants, 2*s.* 6*d.* each; smaller ditto, 6*s.* per dozen. Rhododendron campanulatum, caucasicum, catawbiensis, &c., 100*s.* per 100. Standard Roses of all the finest sorts, 12*s.* per dozen. A large stock of Evergreen Oak in pots and transplanted; also common Oak, Elm, Beech, Birch, Berberis, Hornbeam, Privet, &c.
Orders must be accompanied by remittances. Orders amounting to 5*l* delivered free.—Poole Nursery, Dorset.

POLMAISE HEATING.

J. LEWIS'S IMPROVED POLMAISE STOVES are delivered to the Railways in London, with Plans for fixing. For a Greenhouse: 20 feet by 12, 6*l.* 10*s.*; 30 feet by 14, 8*l.* 10*s.*; 60 feet by 18, 10*l.* 10*s.* Stoves for Churches, Schools, and Halls, according to size.
Hothouse Works, Stamford-hill, Middlesex.

WILLIAM MASTERS, Exotic Nursery, Canterbury, having the largest and most diversified stock of NURSERY PLANTS in the country, and by long experience being expert in determining the characteristics of various sites of ground, so as to plan and plant them most desirably, offers his assistance to gentlemen requiring the aid of a Landscape Gardener, or wanting Nursery Plants at the most economical prices. Planning and Planting by contract, if required. Communications to the above address will receive immediate attention.

GARDEN SEEDS of a superior quality may be had in Collections of 1*l.*, 2*l.* or 3*l.* worth, containing a supply for the whole year, upon application to the Subscriber. Also, a large Collection of the best FLOWER SEEDS, in assortments of 25 kinds for 6*s.*; 50 for 10*s.*; 100 for 18*s.* Larger quantities in proportion. Orders amounting to 2*l.* and upwards delivered to any station on the South Eastern Railway.

WILLIAM MASTERS, Exotic Nursery, Canterbury.

NEW VERBENA, TURNER'S "MRS. MILLS."—The following opinion of the above is from Glenny's Garden Almanack: "This variety was exhibited at the Shacklewell Dahlia and Seedling Show, and at Birmingham, where it was awarded First Class Certificates. It is unquestionably the best formed of all we have seen in cultivation; the petals nearly touch each other at the outer edge, and the outline, though not perfect, is nearer to it than any we have seen; it is one of the colours that come near to blue." It is a beautiful pot plant, and equally desirable for bedding, being of close habit, free flowering, and fine foliage. Plants in spring, 5*s.*

Royal Nursery, Slough.

BASS AND BROWN'S GENERAL SPRING CATALOGUE, for 1850, of SEEDS AND PLANTS, will be supplied free by post on application.

In their Catalogue will be found a rich assortment of the newest and best articles which can be procured, and contains the usual descriptive and useful information, both of seeds and plants, provided in their previous annual Spring Catalogues.

CHOICE VEGETABLE SEEDS.

Complete Collections of the best and newest sorts, in proportionate quantities of each, for large and small gardens, at per collection, 1*l.*, 2*l.*, and 3*l.* If any sorts are not required, enlarged quantities of others will be sent.

A Collection may be had of good sorts for a small garden, for 10*s.* 6*d.*

CATALOGUES OF ROOTS free by post, on application, comprising our superb new Ranunculuses, Gladioluses, &c.

☞ *The Branch Railway being now open to Sudbury, and the Eastern Union continued through to Norwich, we shall now deliver goods carriage free to London, Norwich, or any station on the line. With goods amounting to not less than 40s., plants or seeds presented gratis.*

Post-office orders payable to either BASS and BROWN or STEPHEN BROWN. Remittances requested from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

TO FLORISTS AND OTHERS.

TO BE DISPOSED OF, on reasonable terms, the Lease, Stock, &c., of a FLORIST AND SEED BUSINESS, situate 5 miles from the City, and in one of the best neighbourhoods round London. The greater portion of the premises are newly erected, and comprise a Dwelling-house, commanding Show-house, and Seed-shop, with Stove and five Plant-houses, Pits, &c., the whole of which are heated by Hot Water, on the most approved principle. The Glass may be either taken at a valuation with the stock or at a rental.—For further particulars, apply to Mr. D. A. RAMSEY, Auctioneer, &c., Brompton Nursery, Brompton, Middlesex.

Now ready,

AYRES' AND MOORE'S CULTURAL AND DESCRIPTIVE SEED LABELS.

OPINIONS OF THE PRESS.

"One of the most ingenious and useful contrivances of the day; one which every seed vendor in Great Britain, of whatever class, should make up his mind to adopt."—Gardeners' Journal, December 22, 1849.

"Particularly useful, and therefore deserving of general patronage. * * * We recommend purchasers to obtain their seeds packed in these useful envelopes."—Cottage Gardener, December 22, 1849.

"A series of seed labels, or seed papers, for all the popular biennial and perennial flower seeds—for general use. * * * We strongly advise seedsmen to use these instructive seed papers, which must come into general use as soon as they become known, either with vendors or the purchasers of seeds."—Horticultural Magazine, January, 1850.

"The value of information of this kind to amateurs cannot be over-estimated, and we anticipate every seedsman in the kingdom will avail himself of their use."—Durham Advertiser.

"As these Descriptive and Cultural Labels cost very little more than the paper, *the purchaser can insist upon having them*; they will then speedily become general."—Liverpool Standard.

Published wholesale by D. M. AIRD, 170, Fleet-street, London, from whom specimens and lists may be obtained.

COLE'S SUPERB DWARF RED CELERY.

WM. PORT AYRES begs to inform his friends and the public that he can supply the above SEED of his own growth, in sealed packets, with "Directions for Cultivation," at 1*s.* each. This Celery may also be had genuine of the following Seedsmen, &c.:

AYRES' SUPERB LATE WHITE CELERY.—This is a small and very excellent Celery, remarkable for standing very late in the Spring without running to seed. It is of first-rate quality, and is very strongly recommended. The supply of Seed this season is limited. 2*s.* per packet, post free.

DANESBURY PARK GREEN FLESH MELON. This Melon is recommended as being superior in every respect to the Beechwood, very hardy, a first-rate bearer, and of very superior flavour. 2*s.* 6*d.* per packet, post free Should any purchaser be disappointed in this Melon, W. P. A. will return the purchase-money, so confident is he of its superiority. —The usual discount to the trade.

PATRICK'S SUPERIOR FRAME CUCUMBER. W. P. A. has been fortunate in securing a few seeds of this old but first-rate Cucumber. It can be confidently recommended as being one of the very best in cultivation, suitable alike for POTS and FRAME FORCING, and quite at home upon the open ridge. It is very hardy and prolific, very dark, slightly ribbed, with black spine; length, 12 to 20 inches. Packets, post free, 2*s.* 6*d.*

SNOW'S SUPERB WINTER WHITE BROCCOLI.—A few pounds of this superb Broccoli has been received direct from Mr. Snow, and therefore it can be warranted genuine. The seed will be sent out *neat* as received from Mr. S., so that its vegetative power may be depended upon as being at the least 75 per cent. Packets, post free, 2*s.* 6*d.* each.

MISCELLANEOUS SEEDS.—The following can be recommended as being of first-rate quality:

BROCCOLI.

	Per packet—*s.*	*d.*
Elsden's superb Winter White	2	0
This variety is not so handsome as Mr. Snow's, but is more hardy, as it stands the generality of winters uninjured.		
Elsden's April White Mammoth	1	0
A large and excellent late kind.		
Hammond's true White Cape	2	6
A genuine stock of this first-rate autumn Broccoli.		
Walcheren, true Dwarf	2	6
Miller's Dwarf	1	0
Very late, and being small, may be planted at 1 foot apart. Recommended for amateurs.		
Wilcove, true	1	0
Green Cape, true	1	6
From a first-rate stock.		
New Hearting Borecole	1	0
Buda Kale, true	1	0
Brussels Sprouts, true Dwarf	1	0

	Per packet—*s.*	*d.*
Paragon Cabbage	1	0
Walcheren Cauliflower	2	6
Berkshire Green Cos Lettuce	1	0
Ayres' Giant Curled Parsley	0	6
Dwarf Drumhead Savoy, true	1	0
True Ridge Cucumber.	1	6
	Per quart.	
Hair's Dwarf Green Mammoth Knight's Marrow Pea	5	0
The finest Pea known.		
Isherwood's Railway	1	6
The earliest Pea known.		
Bishop's New Long-podded Dwarf	1	6
A first-rate kind.		
Burbidge's Eclipse	1	6
Very dwarf.		
Auvergne, true	1	0
Fairbeard's Surprise, and Champion of England Peas, each	1	6
British Queen, Thurston's Reliance, and Knight's Pea	2	0

*** W. P. A. begs to direct attention to his *priced* Catalogue of Vegetable Seeds, from which purchasers may make their *own selection, cheaper than at the cheapest of the cheap advertising houses.* All Seeds from this establishment will be sent out with printed labels, bearing full cultural directions. A select collection of Stove and Greenhouse Plants, Heaths, Azaleas, Pelargoniums, and Florists' flowers generally, at moderate prices. A remittance indispensable from unknown correspondents. Post-office orders on Greenwich payable to

WILLIAM PORT AYRES, Brooklands Nursery, and No. 4, Tranquil Place, Blackheath, Kent.

COLE'S SUPERB SOLID RED CELERY.—This fine Celery has given such entire satisfaction, not only for the great size to which it attains, but for its unequalled crispness and exquisite nut-like flavour, that it needs no further recommendation. Seed may be had genuine from the grower, WILLIAM COLE, Dartford, Kent, in sealed packets, 1*s.* 6*d.* each, or the amount in postage stamps; also of Messrs. J. and J. FRAZER, Leyton, Essex; Mr. BUNYARD, Maidstone, Kent; Mr. CRIPPS, Tunbridge Wells, Kent; Mr. DENYER, 82, Grace-church-street, London; Mr. TILEY, 16, Pulteney-bridge, Bath; Mr. FRANCIS, Hertford; Mr. MILNER, Bradford, Yorkshire; Messrs. J. and J. FAIRBAIRN, Clapham, near London; Messrs. GARAWAY, MAYES, and Co., Bristol; and of Mr. SMITH, Westerham, Kent; Mr. FONTEY, Nurseryman, Plymouth; and Mr. IVERY, Nurseryman, Peckham, Surrey.

*** A liberal allowance to the trade.

W. COLE further states, in justice to himself and agents, that his entire stock of seed saved in 1849 is in his possession and that of his agents, from whom it may be had new and genuine, bearing his name and address printed on the envelope.

"BROMHAM HALL" GREEN FLESH MELON, Is the finest flavoured in the World.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior Melon called "BROMHAM HALL" GREEN FLESH MELON, respectfully invites the attention of the public generally, to the superiority of this over all other Melons ever yet sent out. It was forwarded to the Editor of the *Gardeners' Chronicle*, July 22d, 1848, for his judgment, and he was of decided opinion that the Bromham Hall Melon was the finest flavoured fruit he had ever tasted. It was exhibited at the Chiswick Exhibition, July 11, 1849, where it was awarded by the judges the Silver Knightian Medal for the best flavoured green flesh Melon. It was again sent to Dr. LINDLEY, August 11th, 1849: "We have received your Bromham Hall Melon, it was much over ripe, nevertheless it was by far the best flavoured Melon we ever tasted." It was again exhibited at the Horticultural Society's Rooms, Regent-street, September 4th, 1849, and was again pronounced by the judges to be the best flavoured Melon they ever tasted, and was awarded the Banksian Medal. The fruit is very handsome—it is round shaped, hollow crown, beautifully netted, thin skin, flesh very firm and solid, melting flavour, very free setter, and abundant bearer. Weight, from 3 lbs. to 4½ lbs. It has been found to do well during the summer, without bottom heat. It may be as easily grown by an amateur in a frame as the common Vegetable Marrow. There is a great advantage in it for the fruiterer, as it will retain its fine flavour for a considerable time after being cut. Sold in packets of 6 seeds, 2*s.* 6*d.*; larger do. of 15 seeds, 5*s.* Also the following fine varieties can be highly recommended all true:

	s.	*d.*	
Queen Melon	1	6	per packet.
Bowood Green Flesh	1	0	"
Beechwood do.	1	0	"
Windsor prize do., 1*s.*; Emperor	1	0	"
Fleming's Trentham Hybrid	1	0	"
Duncan Green Flesh do. improved	1	0	"
Hampton-court Green Flesh	1	0	"
Egyptian do. do. improved	1	0	"
First prize Cucumber, Victory of Bath	2	0	"
Gordon's White Spine	1	6	"

These two Cucumbers are unequalled for their superiority for exhibition, having been thoroughly proved to the satisfaction of hundreds of growers. They will be found to grow as well out of doors on a ridge, or against a wall, during the summer months, as a common ridge Cucumber; also equally as productive. Length, from 20 to 26 inches.

N.B. It is with regret we state that numerous parties have been disappointed by purchasing an inferior variety under the name of Victory of Bath. E. T. begs to say it has proved not to be the true variety sent out by him.

Lord Keynon's Favourite (winter Cucumber), a very scarce variety. It is the best for winter cultivation ever yet grown; it is very hardy, and free setter, and never shanks off; fruit very handsome. Length, about 14 inches. 2*s.* 6*d.* per packet. A packet of each of the three varieties, 5*s.*; if preferred, also a packet of the Bromham Hall Melon will be included with the three Cucumbers for 7*s.*—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or 1*d.* postage stamps.

GLASS FOR CONSERVATORIES,

JAMES PHILLIPS AND Co. have the pleasure to hand their New List of Prices of GLASS for Cash.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

RENDLE'S DESCRIPTIVE CATALOGUE OF SEEDS can still be obtained GRATIS, on receipt of two penny stamps, to pay the postage.

OPINIONS OF THE PRESS.

Dr. LINDLEY, in the *Gardeners' Chronicle*, Dec. 22, 1849, says, "*This contains lists of good vegetables, with useful notes appended to the names of many of the sorts. . . . It is a well-arranged Catalogue, and will be found of service to all purchasers of Seeds.*"

The Editor of "The Midland Florist," for January, 1850, says, "*We have just received the General Catalogue of Garden, Agricultural, and Flower Seeds, sold by William E. Rendle and Co., Plymouth, which, from its excellence, well merits something more than a passing notice, and happy shall we be from time to time (with Messrs. Rendle's permission) to extract some of its valuable information for the benefit of our readers. . . . The Flower Seed List is peculiarly comprehensive, and gives to each variety its scientific name, hardihood, time of duration, colour, height, and time of flowering. Our readers will thus see that, from its immense utility, we can scarcely say too much in its recommendation; and we are sure that the name of the eminent firm will be a sufficient guarantee that every article they send out will not only be true to name, but also of the best possible quality.*"

Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

HOME GROWN SEEDS.

SUTTON'S NEW PRICED CATALOGUE OF HOME GROWN SEEDS, being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL, and FLOWER SEEDS, with prices affixed to each article, will, it is presumed, be found the most useful and convenient of any yet presented to the public.

All purchasers of Seeds would do well to peruse this Catalogue, as the low prices therein quoted will enable them to effect a great saving in their expenditure. It will be sent gratis on the receipt of a penny stamp, for postage.

MESSRS. SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS are now in course of delivery at the undermentioned prices. No. 1, 2*l.* 2*s.*; No. 2, 1*l.* 1*s.*; and No. 3, 12*s.* 6*d.*—Reading Seed Warehouse, Reading, Berks.

DARTFORD NURSERY, DARTFORD, KENT.

J. D. PARKS offers to the public some fine Standard Full-trained PEACHES, 2 years moved, and finely rooted, good melting sorts, at very low prices. Also large Limes, Poplars, Planes, Horse Chestnuts, Thorns (various), Acer macrophylla, Spruce, Larch, Silver and Scotch Firs, some of them 20 feet high, at very reduced prices, to clear the ground. Also, Hornbeam, some tall, and some bushy; Weeping Ash, &c.

A highly improved SEEDLING SCARLET GERANIUM, raised from the old Globe, or Compactum, that being a pale scarlet, and the seedling very bright. Price 5*s.*, for strong plants in March. They have been shown to a London nurseryman, who has ordered two plants.

J. D. P. is also the author of a pamphlet on "The Treatment of a Deranged Spine or Back," price 1*s.*, which can be sent anywhere by post, with a 2*d.* stamp. J. D. P. also undertakes the cure of deranged spine.

STRONG THORNS AND FOREST TREES.

ISAAC DAVIS, Larkfield Nursery, Wavertree, near Liverpool, having to clear off this year a portion of his Nursery Stock, consisting of 100,000 strong transplanted Thorns, a few thousands of Oak, Ash, Elm, Scotch Fir, &c., &c., from 3 to 5 feet, he would be glad to sell them very cheap.—Jan. 19.

SEEDLING RANUNCULUS ROOTS.—Selected show varieties, containing edged, spotted, striped, mottled, and beautiful self colours, of 12 years' selection, and which have gained upwards of 40 first prizes, are now offered in one mixture, for the first time, at 21*s.* per 100.

SAMUEL WALTERS, Hilperton, Trowbridge, Wilts.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes ...	8*s.*	Early Manleys	7*s.*
*Early Round Frame ...	8*s.*	Early Cockneys	7*s.*
Early Ash-leaved Kidney	8*s.*	Fox's Seedling	7*s.*
Second Early Potatoes for Winter and Spring use:			
American Native Potatoes	5*s.*	Kentish Pink Kidney ...	4*s.*
York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

IF our readers will take the trouble to refer back to our volume for 1848, p. 254, they will observe an article entitled the "Florist and the Rose-maggot;" requesting our particular attention to the history of this destructive insect, with reference to the observations then recently published in the "Florist," and extracted thence into our columns of the same year, p. 191, announcing the discovery, in little cylindrical burrows in the dead snags of Rose bushes, of the winter-quarters of a small, black-headed maggot, which was there asserted to be the young state of the Rose-maggot applied, by the way, to the larvæ of any of the numerous small species of moths which burrow into the Rose-bud and eat out its heart). In a subsequent page (299) a woodcut is given of a Rose-snag cut open, showing a number of cells, each of which is said to have been the birthplace of these destructive larvæ.

Since the publication of these several notices our attention has been directed to this subject, and the result of our examinations renders it necessary for us to advise the gardener not to cut off the dead ends of these snags; since, although in a very few instances, we have met with the little black-headed maggot in question, yet in the majority of cases we have found that the burrows are inhabited, and, in fact, formed by a different insect, whose economy is in the highest degree singular, and which deserves the protection of the gardener, from the benefit which it confers upon him, by destroying great numbers of his enemies, the plant-lice. But this is not the whole of the result of our examinations, for we have thereby picked up some facts in regard to the natural history of four or five other species of insects inhabiting the same situation, the economy of which has hitherto remained unknown, or has baffled the researches of entomologists; so that we may safely affirm that these Rose-snags offer a mine of interesting observation to any person disposed to regard such investigations in their proper light.

CEMONUS UNICOLOR magnified, and of the natural size, carrying an aphis in its mouth, together with a Rose-snag cut open, showing a provisioned cell, a cell with the full grown larva, and one with the insect in its cocoon.

In the present article we shall confine ourselves to the species which, from its curious economy, may be aptly termed the APHIS SEXTON of the Rose-snags. On the 20th of June, 1848, whilst looking over some standard Roses, to examine the state of the dead ends, which had been cut off obliquely, we observed a little glossy black fly, full of activity, alight on the top of one of the twigs, and as suddenly creep into one of the little circular burrows which we had observed formed in the soft pithy part of the twig. Our attention was immediately roused, not only by the action of the insect itself, but also from the fact that it carried some small green object in its mouth. It soon flew out of the hole, and after patiently watching the stem we saw it again approach, but more carefully, in consequence of our being so close to its burrow. We had, therefore, an opportunity of observing that its load was a green aphis, which it at length took into its hole, as it had done with the former.

This observation let us into the whole secret of the manufacture of the burrows, the insect by which, and the object for which, they were made. Our little black fly was one of the small burrowing wood wasps, and it made these holes for the purpose of fitting up a cell for the abode of its progeny, still unborn, the food of which when hatched was to consist of the store of aphides which it was then engaged in burying. Such is the course of proceeding of many species of sand and wood wasps, whose economy has been often observed and is well known; but this species presented several circumstances worthy of notice. The aphis was carried by the wasp in its jaws, whereas many of the allied species make use either of their fore, middle, or hind legs to clasp their prey, but here it is so weak and so light in weight that the wasp is able to carry it without the assistance of its legs. Several aphides are thus deposited in the little oval cell previously formed at the bottom of the burrow, together with an egg, and then a covering is fixed over the whole; another cell is then filled, which is of course nearer to the top of the twig than the first, and so on several cells are thus successively formed and filled. It is important to notice that the imprisoned aphides are not killed by the parent wasp (in which case they would become putrid), but that the young larvæ, when hatched, have a store of *fresh* food; they do not, however, keep their victims long in suspense, as they are quickly hatched and are very voracious; indeed, by the end of July or August they have attained their full size and entirely consumed their stock of food, which the parent fly has the instinct to apportion to their entire wants; but what is sufficiently curious, although they are full grown at this early period (when the heat of the weather is sufficient to cause them quickly to undergo their transformations), yet they remain unchanged as larvæ, all through the winter, in the shape of small yellow footless grubs, enclosed in a shining silken kind of case, becoming pupæ in the spring, and assuming the perfect winged state about the end of May. We have reared the same insect in burrows formed in the pith of Elder sticks stuck in our garden; and Mr. F. SMITH states that it also burrows into bramble sticks, depositing small green caterpillars in its cells.

This wasp, which belongs to the Hymenopterous family of Crabronids, is named, from its uniform black colour, Cemonus unicolor. It varies from rather less than a quarter to more than a third of an inch in length; it is slightly covered with fine silvery down on the head and thorax, and has the abdomen glossy, finely punctured, and affixed to the thorax by a curved footstalk scarcely longer than the remainder of the first segment. The male differs from the female in having more of the silvery down on the face. It is one of our commonest of insects. *J. O. W.*

ONCE upon a time the great object of the English Gardener was to make what he called a COLLECTION of plants. If he had a greenhouse he would have a collection of Heaths, or Pelargoniums, or Mesembryanthemums, or Aloes; if the master of a stove it was in that case his ambition to get together a collection of Passion-flowers, or Ferns, or Ixoras, or something of the sort. If confined to an acre of ground he would have a collection of Apples, or Pears, or Gooseberries; the owner of a few rods of land would be content with a collection of Peas, or Lettuces, or Potatoes. In any case, a collection was the great end to be attained. In forming these collections men did not consider whether the plants were useful or useless, handsome or ugly, different or identical; all they wanted was a long list of names; and a proud man was he who could say that he reckoned a larger collection of Gooseberries, or Apples, or Potatoes, than his neighbour. The addition of a "seedling" or two, of his own raising, elevated him to the summit of horticultural happiness. *Felix ter et amplius!*

We have heard of one gentlemen who numbered 1200 Roses in his list, among which were about 350 wild Briars, some of which had a little hair on their leaves, and some had none, some had double teeth, some had single, one sort had ovate hips and another oval, and so on. There exists we believe to this day a collection of Pæonies formed upon the same enlightened principle; and we have no doubt that similar collections of Daffodils, Michaelmas Daisies, or Catmints, may be found in some sequestered garden.

This harmless folly, like many other crotchets, destitute of all elements of longevity, could scarcely exist, one would think, in this utilitarian age. We are therefore witnessing at the present day collections giving way to selections; "hard pruning" applied in all directions to those old bushes of barren half dead wood; and a few select plants, thoroughly well grown, replacing the empty pots and moribund sticks which invariably characterised the collections of our worthy forefathers and their ancient sons as long as they remained among us. It is therefore not a little curious to find a race of worthy men still unconscious of the change in public feeling, and continuing to publish interminable lists of this and that, as if the rage for collections was as fresh as ever.

Some recent lists of nurserymen and seedsmen afford amusing examples of this. One grower of Roses offers 607 sorts of that flower; another, 850; a Potato-saleman's catalogue has 160 sorts; a Dahlia-grower's 3 or 400; a Geranium-grower's, as many; a seedsman invites attention to his 38 sorts of Cabbage and 61 sorts of Peas!

Can extravagance go further than this? Should any one be surprised at the murmurs which are just beginning to make themselves heard on the part of buyers, or that a host of Rose-lovers should already have arrayed itself on the side of our correspondent "Crito?" Do the gentlemen who offer these wares to the public seriously think there is common sense in thus bewildering their customers? that the names under which their "sorts" are sold indicate real differences of quality? The idea is absurd. Sixty sorts of Peas! Why, there is not a dozen really worth growing; the rest are little more than fudge. We should be curious to know how many sorts of these Peas are provided from one bag of Charltons, bought of one of the great London seedmerchants. It would be worth while for an idle man to get a complete set of such Peas, to raise them, compare them, and report the result for the public good.

In this respect buyers are greatly in want of such

a guide as the French possess in their invaluable "Bon Jardinier." There we find the whole number of Peas, reputed as distinguishable, to amount to 34, and of these many are distinctly shown to be of no importance. Perhaps we may make it our own business to put an end to the absurdity belonging to English vegetable seed-lists.

It should always be borne in mind that, to render a variety worth permanent cultivation, it should possess some peculiar quality in which it distinctly excels all other varieties previously known. To distinguish it merely because it is "a seedling," as some do, is sheer anility. Those who are every year bringing forward what they call novelties are bound to show that they have been proved by competent judges to be not only different from, but better than anything previously known; and if buyers were wise, they would refuse to purchase in the absence of satisfactory evidence as to this point.

What is true of mere varieties, such as those of common kitchen garden plants, is equally true of the species belonging to classes holding a more aristocratical position in vegetable society. The possessor of a park admires the magnificence of the Conifers which he sees in the possession of his country neighbour. Let him set about forming a collection of Conifers, and what does he get? many magnificent kinds, some of very inferior beauty, and many of no interest whatever. The latter ruin the appearance of the others, and the effect which was looked for is marred. Take, for instance, a very good list of Conifers now before us; who is there that would wish to become possessor of such Pines as those called *monophylla, tortuosa, pungens, mitis, inops, Banksiana*, the tag-rag and bobtail of the race? In this, as in all cases, a selection is admirable, a collection an absurdity. So with Orchids, now much and deservedly the fashion. In that glorious order are found species of the most brilliant colours, the most exquisite perfume, and the strangest forms—each class admirable in its peculiar way. But the cultivator who proceeds to fill his house with these plants will be much deceived if he imagines such qualities to be universal, or even usual, in the race. About 2000 species are known to us, with a legion of varieties, and certainly there cannot be more than one-sixth of that number which will repay the grower for his trouble. In the great genera of Epidendrum, Catasetum, Dendrobium, Oncidium, Pleurothallis, Stelis, Oberonia, and Maxillaria, are to be found swarms of species which would be thrown out of a bit of rock-work in a flower garden, if they could be cultivated there. He then who spends his coin in making a collection of Orchids, will be inevitably disappointed; he alone who forms a good selection will be rewarded.

We need not say that these remarks are made with reference to horticulture, and not to botanical researches. The cultivator has one object in view, the botanist another; and it will often happen that the qualities which interest the one in the highest degree are precisely those which the other disregards. But such botanists are not buyers of live plants; their herbaria are their gardens, and very satisfactory ones too. It is therefore clearly the interest of nurserymen and seedsmen to take off their botanical spectacles, and to look at what they sell with the same eyes as their customers. They will cultivate that only which is worth cultivating; they will catalogue those things only which a buyer ought to buy; all the rest they will relinquish to the student of the "Curiosities of Horticulture." If they will do that, we shall soon see the lists of plants and seeds cut down to reasonable dimensions, and they will no longer be, as many of them now are, mere mazes, in which one could not find his way even with the clue of an ARIADNE.

CHEVREUL'S SCHEMES OF FLOWERS FOR MAY.

1, White Candytuft, red Tulip or double Lychnis (Lychnis sylvestris), white Candytuft, red Tulip or double Lychnis, &c. 2, White Candytuft, red Tulip or double Lychnis, yellow Alyssum; then again white Candytuft, and so on. 3, Blue Iris, white Iris, blue Iris, white Iris, &c. 4, White Iris, Oriental Poppy (Papaver orientale), white Iris, Oriental Poppy, &c. 5, White Iris, Oriental Poppy, blue Iris, Oriental Poppy, then repeat. 6, Red Valerian, white Valerian, red Valerian, white Valerian, &c. 7, White Valerian, Oriental Poppy, white Valerian, Oriental Poppy, &c. 8, Red Valerian, blue Iris, red Valerian, blue Iris, &c. 9, Red Pæony, white Pæony, red Pæony, white Pæony, &c. 10, Oriental Poppies alternating with Gueldres Roses produce a good effect. 11, Gueldres Roses, Flax, Gueldres Roses, Flax, &c. 12, Blood-red China Rose (Rosa semperflorens), pink China Rose, blood-red ditto, pink ditto, &c. 13, Pink China Rose, white ditto, pink di to, white ditto, &c. 14, White China Rose, pink ditto, white ditto, red ditto, and so on, beginning again. 15, Red China Rose, pink ditto, white ditto, red ditto, pink ditto, white ditto, &c. 16, Pink China Rose, red ditto, pink ditto, white ditto, pink ditto, red ditto, pink ditto, white ditto, &c.

A very good border can be made by alternating groups of pink China Roses, or of Cinnamon Roses, with, 1, groups of Laurustinus (Viburnum tinus); or 2, groups of yellow Jasmine. The groups should be 1 yard apart. The same Roses may alternate with common Laurels (Cerasus Lauro-cerasus); in this case the groups should be from 1 to 2 yards apart, and the Roses should be placed in threes, so as to form an equilateral triangle. The following arrangements also look well: 1, Common Lilac, white Lilac, common Lilac, white Lilac, &c. 2, Common Lilac, Laburnum, common Lilac, Laburnum, &c. 3, Laburnum, common Lilac, white Lilac, common Lilac, Laburnum, common Lilac, white Lilac, common Lilac, &c. 4, Laburnum, common Lilac, Syringa, common Lilac, then repeat. 5, Persian Lilac, Spiræa hypericifolia or ulmifolia, Persian Lilac, Spiræa, &c. 6, Persian Lilac, Kerria japonica, Persian Lilac, Kerria japonica, &c. Although the Kerria flowers a little earlier than the Persian Lilac, this arrangement answers very well. 7, White Lilac, Judas Tree (Cercis siliquastrum), white Lilac, Judas Tree, &c. 8, White Lilac, pink Tartarian Honeysuckle, white Lilac, pink Tartarian, &c. 9, Italian May (Spiræa hypericifolia), yellow Jasmine, Italian May, yellow Jasmine, &c. 10, Perfumed Cherry (Prunus Mahaleb), Judas Tree, Perfumed Cherry, Judas Tree, &c. When the Judas Tree is in flower, the perfumed Cherry is not; the last arrangement is, however, recommended for the contrast produced by the flowers of the first with the foliage of the second. 11, Perfumed Cherry, Laburnum, perfumed Cherry, Laburnum, &c. 12, Perfumed Cherry, Laburnum, perfumed Cherry, Judas Tree, then repeat in the same order. 13, Gueldres Rose, Bladder Senna, Gueldres Rose, Bladder Senna, &c. 14, Gueldres Rose, Judas Tree, Gueldres Rose, Judas Tree, &c. 15, Judas Tree, Laburnum, Judas Tree, Laburnum, &c. 16, Judas Tree, red Dogwood (Cornus sanguinea), Judas Tree, Dogwood, &c. 17, Syringa, Bladder Senna or Scorpion Senna, Syringa, Sennas, &c. 18, Tartarian Honeysuckle, Spiræa ulmifolia, Honeysuckle, Spiræa, &c. Borders of Anemones, sown thickly, are usually in flower this month.

ROSES.

SPECIMEN PLANTS, SHRUBS, STANDARDS AND FANCY STANDARDS, WITH SEVERAL VARIETIES.

SPECIMEN Roses may be planted in conspicuous and appropriate situations, although it is bad taste to sprinkle them all over an establishment. They should be very few in number, and very handsome in growth. Of the specimens best adapted there is a choice of three. They may be—1, bushes or shrubs; 2, standards of particular kinds; 3, standards with several varieties budded on the same stock. The first may be pruned and trained to attain almost any size by beginning with them young; a dwarf or rather a Rose on its own roots should be selected with half-a-dozen good branches; these may be cut back to 1 foot in length, if strong, or cut back to a single eye if weak, because strong growth to start with is absolutely necessary. With half-a-dozen strong shoots cut back to a foot in length, whether they are obtained at once ready to plant or waited for a year, you have a good foundation for a fine shrub; let these be restrained by hooked sticks stuck into the ground to hold them at equal distances round the plant, and spreading out, with the ends within 6 inches of the ground. Let these make their growth one season with the exception of any shoot that may seem in the way, and at the next pruning time cut out all weak branches, and remove all shoots that come up fresh from the root, because to be handsome the bush must grow without being choked by suckers. All the shoots should be shortened to various lengths from one to four eyes, according as they help to form a good shrub or otherwise, and any that are in the way may be cut clean out altogether.

The after treatment of this kind of specimen is as simple as that of a Currant or Gooseberry bush, but in all pruning of Roses it is necessary that the shoots should be cut as close to the eye as possible without injuring it, and all shoots removed altogether should be cut as close to the stem from which it grew as it is possible; all snags are dangerous, and shoots not cut back close to the eye are apt to die back past the eye. The shrub once attaining a sufficient size and strength will live for years, and continue in perfection in a sort of wild growth without any sort of care. The principal object to be attained is a plant calculated for the purpose. After a certain number of years the Rose will do without pruning, and yet be a splendid object, for it will prune itself, or at least those shoots which really require removing will die back, and you will merely have to cut away the dead wood.

The tree Rose for a specimen should be selected thus; first it should be on a strong healthy stock, perfectly straight; secondly, the bud must have been placed on a strong shoot, and pretty close to the stock; thirdly, it should be of the particular sort calculated to form a handsome head; fourth, it should have a healthy, undamaged root. This may be planted in the usual way, and with the necessary care. The growth of a standard tree, if not attended to at first, will never be right, and cannot be made handsome. The hints already given about pruning may be sufficient; but the object should be to get the head as large across as the height from the ground to the underpart, and as thick from the bottom of the head to the top, or two-thirds its diameter; therefore in the pruning of standards we ought to leave the end bud under the branch, that the lower branches may always incline downwards; and these end shoots being left two eyes long every time the trees are pruned, soon attain the desired size; but occasionally we are able to leave three or four eyes instead of two, when any portion of the tree wants filling out.

As the standards advance to a large size, and the head gets almost uncontrollable, the tree happens to require less of our assistance. It assumes an imposing appearance, and the increase of the head is much slower. Before the head calls for all the strength of Nature to supply its wants, the shoots grow long and strong, but then the tree has to support a large head, and there are a thousand shoots instead of a dozen; the shoots do not grow more inches than they at first did feet, so that, if the tree be left to itself, it very soon suits its growth to its situation. We have seen trees carefully pruned for 10 or 12 years, and then left to themselves, continue to be splendid specimens for years afterwards.

The third kind of specimens are whimsical perhaps, but curious and interesting for all that. To get these in good, handsome condition, and healthy, we must begin with a remarkably strong Briar, and, instead of cutting off the forked head, we should retain as many branches as we can; say we have three good branches spreading out a foot each way when the Briar is planted. Let it have all the necessary care of a good valuable Rose, as to the pruning of the root, the application of the dung, and the planting and stake; all of which we should have done on the spot where it is to remain. Rub all the shoots from the stock except those on the forked branches, and allow about three branches to remain and grow on each of these three forked branches. In selecting the three to be retained, have an eye to the object, which is to place a bud upon each of the whole nine, and therefore let those that remain be in the best position to support the independent growth of their own head. In July insert a bud in each of these nine shoots, which are the only shoots allowed to grow. Let the buds be put in as close to the heel of the shoot as possible, and on the upper side. All the buds should be different Roses, but all of one habit—of the slow-growing, ever-blooming sorts; if some were more vigorous than others, there would be no uniformity of growth, and it would all be confusion.

In pruning these, the principal point to be attended to is to cut them where they are crowded, to remove superfluous wood, and not to attend to the shape of the individual sort, but to their general growth, so as to form one head among them all. The small Roses are the best for this kind of specimen, and the colours should be contrasted as well as the choice will allow; such a head, when in bloom, is a very beautiful object, and with a strong Briar it is attained in one season partially, but in two perfectly, although it continues to improve for many years. The stock, and particularly the forked branches of it, must be constantly watched, to see that it does not shoot; for if it did, and was unnoticed, it would steal its way up among the branches, and pretty nearly choke up the head before it would be discovered, and all that time the various budded varieties would suffer, if some were not altogether destroyed; so that it is impossible to be too watchful.

As to the places in which specimen plants should be located, much depends on the form of the beds and clumps about the lawn, or the disposition of the paths. Specimens are planted with advantage near a clump, but not too close, and if opposite to a recess or inward curve, so much the better, but there should be 10 or 12 feet between the specimen and the clump, and in all cases they should be within a few feet of the path; but this is purely a matter of taste, as well as the form and disposition of clumps, the shape of a lawn, or the direction of the road. In some cases a few specimen plants of Roses add greatly to the effect, but until they have attained a considerable size they look poor and unmeaning, yet it is better to grow them where they are to remain than to remove them large, for however they may escape immediate danger they perhaps never attain that vigour which alone can secure healthy growth.

Crito.

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

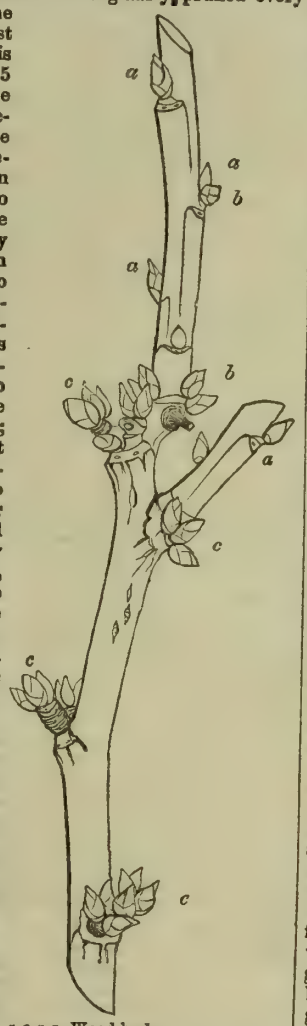
(*Continued from p.* 21.)

DIRECTING our course along the north side of the lake, the vegetation is continually changing, and fresh objects of interest are constantly presenting themselves. The sides of the irregular Grassy path are clothed with huge blocks of rock, interspersed with interesting and valuable plants. There are occasionally to be met with masses of Berberis trifoliata, B. buxifolia, B. empetrifolia, B. rotundifolia, Ilex latifolia, Cotoneaster microphylla in large bunches, Arbutus tomentosa, 4 feet high and the same across, Mahonia glumacea, and fine plants of Juniperus tetragona, J. mexicana, and occasionally immense shaggy tufts of Juniperus tamariscifolia, hanging into the water. As we travelled along, beautiful specimens of the following were constantly occurring: Juniperus gossainthania, J. Bedfordiana, J. pendula (from China), J. lycia, J. Bermudiana, J. oxycedrus, J. phœnicea, J. squamata, J. excelsa, J. nana, J. sibirica, J. communis pendula, J. virginiana pendula, J. Sabina variegata, large bunches of Genista triquetra, G. germanica, G. actinacantha, G. multiflora, G. juncea, also profusely disposed large groups of the common and variegated Rosemary, white and common Lavender, &c. Behind these, among the high irregular rocky mounds, are grand plants of the yellow-berried Holly; some of the rocks were partially covered with variegated Ivy. We here saw a Juniper [illegible] the name of which is un-

known, from Candia, 12 feet high; and a Cupressus thurifera, 15 feet in height, planted on dry hills.

Leaving this, we take an inland curve, planted with Deodars, Hemlock Spruce, Picea Webbiana, Pinus Cembra, P. Laricio, P. Banksiana in the background; and nearer the walk are numbers of Juniperus excelsa, J. virginiana, Lavender, Southernwood, white-flowering Lavender, Giant Rhubarb, Abies Menziesii, Juniperus sinensis, J. thurifera, J. phœnicea, Yews, &c. Another walk branches off inland, from the back of the great rock, planted with Deodar, Pinus Lambertiana, P. Sabiniana, P. macrocarpa, &c.

One of the most difficult points to manage in ornamental water is the concealment of its terminations. This is very successfully accomplished at the eastern end of this lake, where the visitor is of necessity imperceptibly led into a root-house in a recess, bounded by a Portugal Laurel hedge and margined with Irish Yews, where an opening gives an extended view of the lake, with its islands, and the castle and church tower emerging from the plantations. This arrangement completely screens the head of the lake; sluices are placed here, by which about 20 acres of ornamental shrubbery, surrounding the lake, can readily be flooded in dry weather; near this is an engine-house which supplies the castle with water; the latter is partially concealed, and is otherwise rendered an ornamental feature. Matters of this kind, which are frequently objects that betray bad arrangement or that baffle the skill of the artist, are here made to serve ornamental purposes.



In passing along the south side of the lake, new features are continually presented, both by the nature of the scene on the opposite shore and the entirely new description of plants so frequently introduced. On leaving the head of the lake we pass through plantations whose sides are lined with Juniperus sinensis, 12 feet high, with a front line of Thuja Warreana, 10 feet high, we again come suddenly upon a grand assemblage of Juniperus sinensis, 12 feet high, exclusively on raised banks jutting forward in defile, the surface being covered with Lavender Cotton. Behind these are immense rocks, intermixed with Quercus Ilex, Q. coccifera, the Apulco Pine, Juniperus torulosa, and groups of various kinds of Broom. Retiring from this we come, as if by an accidental pass, upon a huge pile of rock, with an apparently natural circular opening, giving an extensive view of the water, with the bridge half a mile in the distance. Enormous columnar rocks of great height surround this, amongst which we noticed abundance of Abies Clanbrasiliana and A. pygmæa; pyramidal Cedars in groups, Juniperus pendula of China, Picea Hudsoni, Callitris triquetra, Juniperus Bermudiana, various Ruscus and Tamarisks. We proceeded unto an elevated position, where a seat is placed, and a kind of isometrical view of the lake is presented, the church and castle at the same time being entirely hid. The view here almost baffles description; an immense expanse of water, swarming with water fowl, is exposed, as well as the bold sinuosities of the margin, with an inconceivable amount of artificial rock naturally disposed and planted with thousands of the most valuable plants that could be obtained. When we contemplate, for a moment, that this is entirely a work of art, and consider the tens of thousands of tons of rocks all brought from a great distance, employed in its formation, we are left to conclude that it has not only no rival as a work of art, but there is nothing at all approaching it, in any garden in this country. We are now reaching the position from which we started, and, turning to the left, we come upon some Maltese crosses, 25 feet high, constructed of enormous rocky masses, surrounded with rocky hills, planted with large Abies Clanbrasiliana, Savin, and Lavender Cotton; near by are some cylindrical Cedars of Lebanon, the ground amongst them being strewed with Juniperus prostrata. We observed also a fine plant of the silver Juniperus Bermudiana, Thuja filiformis, 6 feet high, and a dwarf variety of Abies canadensis.

It may not be uninstructive to cast a retrospective glance at the scene we have just reviewed. Some writers have contended that rocks in garden scenery are only admissible when the nature of the country presents precipitate and abrupt undulations, with projecting rocky strata. If this be so, it follows that this attractive and highly decorative style must be limited to such places as Nature has indicated by cliffs and precipices; but we entirely dissent from such an opinion. Others, again, consider that if rocks are admitted into garden scenery where the surface is level, nothing must be attempted beyond a mere ridge, as an appropriate situation for Alpine plants; but we look upon this view of the subject in the same light as the former. We have here an example which subverts all such reasoning. Again, as regards ornamental water, it has been stated that its introduction is only justifiable where the mansion is placed on an elevated position so as to command a view of it in the lowest ground presented to the eye. Now it is true that the lowest position is the most natural one for water; but where all situations are alike, and no choice afforded, as in this case, is water, the grandest feature in ornamental gardening, next to trees, to be discarded, merely because certain objections exist as to its site? We think not; difficulties such as these are what master-minds in the art can and do overcome. It is by accomplishing such feats, in defiance of natural obstacles, and in opposition to existing prejudices likewise, which have been set down as defined principles, that these rules and theoretical injunctions have been exposed. We look upon the lake at Elvaston, with its majestic rocky and woody embellishments, as the result of ideas conceived upon the most enlarged views, and with the most enlightened and comprehensive anticipations of what the result would be; and it is only individuals of inflexible purpose who would have undertaken such a gigantic task as the work here described must have been; for it is entirely an artificial creation, under the greatest possible disadvantages, and without the smallest natural inducement or existing capability for such a state of things. *R. G.*

(To be continued.)

PRUNING.—THE CURRANT TREE.

Under every mode of training, the red Currant, and also the white, require to be regularly pruned every year. In rearing the young plants, the first thing to be aimed at is a clear stem, about 5 inches in length, free from suckers. In preparing the cutting, care should be taken to remove all the buds on the portion intended to be inserted in the ground, otherwise many of them would form suckers, injurious to the plants, and troublesome to displace effectually. In some cases cuttings can be obtained long enough to afford at once the proper length of stem; but when such cannot be had, when the cutting is altogether too short, or proves so after the necessary removal of the imperfectly formed wood at top, then three buds above the surface of the ground will be sufficient. These will generally produce three shoots, all of which may be allowed to grow during the first summer after the cutting has been planted, in order to assist in forming roots. Supposing the plant is intended for the open ground, and that it is to be trained in the usual way, open in the centre; then in autumn, after the leaves have fallen, two out of the three shoots which the plant has made should be cut off, and the third, selected as the most eligible for a stem, should be shortened, so that the third bud below the cut may be 5 inches above the ground. Three shoots will generally be produced the following summer. In autumn the plants will require to be planted out where they are to remain, and at the same time the shoots should be cut back to about 4 inches, taking care to cut above buds pointing outwards. We have now a stem 5 inches high, and three branches diverging from it, each of them shortened to about 4 inches. Two shoots should be encouraged from each of these three, so that in autumn the plant will have six shoots, corresponding with the ultimate number of branches necessary. All other shoots must be spurred to within an inch of their bases. The six shoots selected for leaders should be cut back so as to leave them from 4 to 6 inches long; and, like those of the former season, they should be cut to buds pointing outwards. At every future winter pruning the terminal shoots of the six branches should be shortened to between 4 and 6 inches long, according to their strength. When the branches nearly attain the intended height, the terminals may be shortened to two or three buds. With regard to the lateral shoots, they must all be cut to within an inch of the old wood at every winter pruning.

a a a a, Wood buds.
b b, Fruit buds.
c c c, Clusters termed fruit spurs; they consist chiefly of fruit buds, but amongst them there are generally some wood buds which produce small shoots.

Some recommend summer pruning. In moderation it may be advantageously performed. When the plants are luxuriant, and shoots are likely to overcrowd the centre, the tops of such shoots may be cut off in June. But it must be observed that if no shoots were allowed to grow excepting those necessary to be retained at the winter pruning, the plants would in consequence be less vigorous in the following season; for the more leaves the more roots, and the greater the quantity of the latter the more abundant will be the supply of nourishment.

Instead of the open bush-form, Currants may be grown with a single upright stem; and in this way they occupy very little space, and yet produce good bunches of fruit, which are not liable to be spoiled by wet.

When Currants are intended to be trained against a wall, they should be planted 3 feet apart, and a strong shoot trained upright for a stem. This should be shortened to 6 inches, and the two uppermost shoots trained horizontally right and left. From these, four upright shoots should be trained, so that the distance between them may be 9 inches. In order that these may not run up without being sufficiently furnished with fruit spurs, they should be shortened to 6 inches, and every year, at the winter pruning, the upright terminal shoots of the branches should be shortened according to their strength, shorter if weak, and if strong they should not be left longer than is consistent with their breaking into spurs not more than 6 inches apart. The laterals may have their points cut off annually in June, and cut nearly close to the old wood at every winter pruning. Various other modes of training may be adopted, but the same principles of pruning are generally applicable, namely, the shortening of the leading shoots and spurring in the laterals as above directed. The red and white Currants may be grafted on each other with good effect, as regards contrast of colours. *R. T.*

VILLA AND SUBURBAN GARDENING.

The permanent system to be pursued with respect to the pruning of the Vine has, by extensive practice, been made pretty clear. We will begin with pruning for early forcing.

Experience has proved that Vines intended for an early crop must not be cut in so closely as those which are destined to come in later, and with little heat beyond what the sun and glass afford. We shall presume that the Vines to be operated upon have now arrived at a full bearing state. If they have to produce an early crop, we should recommend the spurs to be cut back only to the second or third eye, not closer, as it has been found that when subjected to a high temperature at an early period, those eyes a little in advance of the main stem always break kindlier than those at the axle of the spur. It must be observed, however, that this system of pruning, except great attention has been paid in obtaining a succession of young shoots from the base of the old spur is apt to induce large gnarly snags, as unsightly as they are unproductive. To guard against these, early attention must be paid to securing shoots from the bottom of the spur. These latter will be called into existence by early attention being paid to stopping the spurs which are to produce the fruit. Thus checking the sap in that direction, and preventing the production of useless foliage, the bottom eyes are sure to push; hence one only must be permitted to grow, and it must be stopped as has been recommended for the fruit-bearing spurs.

In pruning for late crops, the spurs should be cut close back to the main stem, leaving only the buds at the very base. If the Vines are in vigorous growth, as they should be, these buds will push with great strength, and show a profusion of bunches, which should be attended to in their earlier stages of development, selecting the most vigorous, and retaining only one, unless you mean to destroy and weaken your Vines for future bearing. Amateurs, aye, and gardeners too, who ought to know better, run into this error, forgetting that it is the last ounce that breaks the horse's back. Vines overworked in their earlier stages of growth never or rarely recover satisfactorily. In my next I shall conclude my remarks on the Vine; they shall chiefly relate to temperature. *Pharo.*

DISEASES OF PLANTS.

(*Continued from page* 21.)

Genus X.; *one species.* Rent (*Screpolo*).—By the term *Rent* I mean a splitting or bursting which takes place suddenly, either by the force of excessive heat, which tears the vessels as it distends them, or by the severity of cold when the air rapidly draws off the caloric from the plant. These rents are usually exactly in the direction of the fibres, or diverge little from it, as at the moment of bursting it is in that direction that the least resistance is offered. When these rents and fissures happen in winter, it is generally at the time of the severest frosts, and they are frequently accompanied by a loud explosion, which is heard over the country. Under nothern exposures, travellers have often heard such noises like the reports of fire-arms.

The same phenomenon happens in summer also, but the thing is less frequent and does not carry with it the same prejudicial consequences that it does in winter, when the rents are followed by necrosis, and are, moreover, neglected. Sometimes these fissures will close naturally. If they remain open, then every means must be adopted to close them, for it is better, in the case of the trees thus injured, that they should show a permanent scar of an old wound than to run the risk of the fissures not closing at all, and offering a harbour for insects and wet which may facilitate internal disorganisation. Some have proposed ligatures for such cases; but this treatment is of use rather for those fissures which are occasioned by some external mechanical violence, than for those which are caused by the excess or by the sudden withdrawal of caloric. I should prefer making incisions in autumn or in spring in the callosities adjoining the fissures, when if the strata of bark have preserved their organisation and the proper degree of stimulus for a prosperous vegetation, the wounds will shortly heal of themselves. The violence with which the imprisoned heat escapes suddenly is perhaps the cause of the noise which accompanies the bursting.

To this genus, it seems to me, may be referred many diseases said to affect trees in particular ways. Some have observed Olive-trees to have their whole outside

so split up that the wood remains bare and the bark separates from it. In the same kind of tree at other times the epidermis and cellular tissue will be slit, whilst the strata of bark and parenchyma will remain entire. These are but different degrees of the above described malady. Nor do I know of any variations except in their effects and consequences which are much more fatal in proportion as the plants are delicate. For example, it is not all the trees of a wood, although struck by the *rents* so as to have their woody tissues split, that will die. But in the instance of the Olive it is different; in the first of the two above-mentioned cases, the death of the portion affected is inevitable. In the second case it will escape entirely, or only perish very late. When the fair season returns and the sap rises, the growth of the substance of the tree will either close the fissures entirely, or excrescences will form, which, although they may ultimately destroy or much injure the branch, will nevertheless support it for a long time. These *rents* will kill a great many autumn-made layers. I have at this moment under my eyes practical instances in confirmation of what I have asserted.

THE FIRST SIGHT OF TREES.

"THE Officer (from St. Kilda) in his Embassy, in *July* last (1696), Travelled so far as to Land on the Continent next to *Sky*, and it was a long Journy for a Native of *St. Kilda* so to do, for scarce any of the Inhabitants ever had the opportunity of Travelling so great a way into the World.

"They observed many wonderful things in the course of their Travels; but they have a Notion that *Mack-Leod's* Family is Equivalent to that of an Imperial Court, and believe the King to be only Superior to him: They say his Lady wore such a strange *Lowland* Dress, that it was impossible for them to describe it; they admired Glass Windows hugely, and a Looking-Glass to them was a prodigy; they were amazed when they saw Cloth Hangings put upon a thick Wall of Stone and Lime, and condemn'd it as a thing very Vain and Superfluous.

"One of the things they wondred most at, was the growth of Trees; they thought the Beauty of the Leaves and Branches admirable, and how they grew to such a height above Plants, was far above their Conception: One of them marvelling at it, told me, That the Trees pulled him back as he Travelled through the Woods; They resolved once to carry some few of them on their Backs to their Boats, and so take them to *St. Kilda*, but upon second thoughts, the length of the Journy, being through the greatest part of the Isle of *Sky*, deterr'd them from this undertaking."—*A late Voyage to St. Kilda, by M. Martin, Gent.*

Home Correspondence.

Continuous Blooming Roses.—I have cultivated a considerable number of Roses for the last 10 or 12 years, and find no Rose which so well merits this appellation, as the Gloire de Rosaméne. On the south front of a house, it yields flowers for a nosegay 8 months out of the 12. Twice during the last five years I have noted this fact; in the one instance the last blossoms were gathered January 4, and the first fresh ones May the 4th, in the other (a mild winter) the last blossoms were January 17, and first fresh, May 17. I did not take accurate note of other years, but its ordinary habit is as above. This winter its blossoms have ceased only with the last frost. I may further add that its late flowers are not miserable half-rotten buds, but fair fragrant flowers, such as adorn a bouquet. The crimson China growing near it does not come into bloom till three weeks or a month later, and ceases a full month earlier; in fact, its flowers are worthless after autumn once sets in. The Gloire de Rosaméne is a semi-double crimson Rose, of very brilliant colour, and fragrant, and a strong grower, about 10 feet high on its own roots. It is called a Bourbon, but has nothing in common with Bourbon Roses, and no doubt owes its origin to some very different and peculiar parentage. It looks almost like a cross between the crimson China and our common Dog-rose, and I am surprised that no attempt has been made to breed from it, as it seeds freely. None of the new Roses show any signs of affinity with it, but I can confidently recommend it as the earliest and the latest hardy Roses which we possess. It does very well as a standard, but does not flower so early; and its proper place is a south wall, to grow up around windows. Being rather naked below, it should be clothed with something else, for which purpose nothing is better than the crimson China. The Gloire de Rosaméne is an old Rose, introduced some 15 or 20 years ago, and may be procured of any nurseryman. *J. R. S. O.* [It is a great ornament of the trellis at Dropmore.]

Spotted Ranunculuses.—The following are six excellent spotted varieties on yellow grounds. Dido, Flaminius, Alexis, Festus, Meander, and Indicator. Can any of your readers furnish a list of half a dozen first-rate spotted ones on white grounds? *X. X.*

Apprentice Fees.—I have frequently seen discussions in your columns which appear to me to need some firm, but not unkind touch, to place the matters discussed in a just and reasonable point of view. The question, whether gardeners are justified in taking apprentice fees from their workmen, is one which can have but one solution, and which is handled in a manner really injurious to the useful class of men who are concerned in it. I will first give my, and I am confident the only, solution to this question. The employer is the only person who can guarantee effectiveness and permanency to the probation and instruction of an apprentice. "A gentleman" neither considers himself entitled to the profit arising from his gardener's skill in teaching, nor could profit by it, although his servant's time and skill are his by purchase, without becoming a tradesman. The gardener or nurseryman by trade, therefore, is the only person who can legally, or ought in good faith to receive, or permit to be received, on his grounds a money-bound learner. Presently we shall have our kitchen maids apprenticed to our cooks—our professional cooks, forsooth! Having given you my solution of the knot, I proceed to the manner in which it is too common to speak and write of gardeners. This lies in making a very useful class of labourers look upon themselves and their calling in an erroneous light, calling their business a profession, and raising Messrs. Blue-apron and Green-apron into a false estimation of their position, and leading them to be discontented with their situation in life. The sensible and expert husbandman, the ingenious and clever artisan, the weaver, the smith, and the wright, bring to their businesses as much mind and labour as the gardener who should even raise Pines, Melons, and Cucumbers, and miscall and misspell a few names of exotic plants, and have as much claim to the position of professional men. An ancient author gives a very true account of the injurious tendency of calling things by any but their right names; the free translation of it would run thus, "It is a thing most pernicious to lose the right terms for matters discussed, or in the business and intercourse of the world." We will see how this affects the case in hand. We have only to look to the third paragraph of the discussion of apprentice fees in last week's *Chronicle*, to see it exemplified in the mention of "the comparatively low salaries" received by gardeners. Why, professional gentlemen certainly should have, at least, 400*l.* or 500*l.* a-year, I must own, though very many in the church, the navy, and the army, not to mention law and physic, have nothing of the sort. And compared with these, the blue-aproned and green-aproned professors are shamefully under-paid. Thus our modest professors, who simply wish 60*l.*, or 70*l.*—nay, 80*l.* a-year, house and garden, and certain implied privileges—implied on their sides, but followed by ejection when discovered on their masters. This demand deprives hundreds of gentlemen of gardeners, and hundreds of gardeners of places, and is considerably more than is expected by men of the highest education, and of the real and dignified professions. Here is a matter of disappointment and discontent arising from the miscalling a trade or business, and that even when practised by a hired menial, a profession. Another source of discontent, not so solid, but perhaps more mortifying, is the expectation of being held in great estimation, and being made of great importance by their masters. I remember in your columns, perhaps a year ago, some gardener expressing himself in some such words as these about masters: "Oh! they don't think of our pro—fessi—on (drawl it out sonorously), but only of the gardener, my servant." Now, really this would be laughable, except that we see in it matter of regret, that these useful labourers for our amusement and luxury should be pained by a chimera of their own, or their false friends' creation. The objects of these harmless people's study and labour are so lovely and so delightful that no person of education and feeling can behold them without ecstacy, nor partake of the fruits of their care and labour without exquisite satisfaction. But the ecstacy and the satisfaction belong to the objects themselves, and not to the hands of honest hardness, which have (by well digging, dunging, potting, &c.) for hire supplied them; though, as long as they keep their humble place, and are respectfully thankful for the means of livelihood vouchsafed them, they may enjoy a slight reflection of the pleasure their faithful industry procures to their employers. The gardens at Kew, and even many noblemen's gardens, may require an army of gardeners of all grades of proficiency, and these will need organisation and discipline, but no one of the heads or managers of these, or any other gardens, is professional as a gardener. At least, we must concede professional dignity to the *artistes* who dress my lady's lovely hair, and decorate her lovelier foot, when we bring ourselves to the bestowal of it upon the graduates in green aprons. But we must correct ourselves. We are not the fountain of honour. We have no right to bestow dignities, though the people are becoming amazingly sovereign in this particular instance. Every cobbler now-a-days is a "reverend, if he 'spounds and 'splains Skripter (to write phonetically), arter wurk a-nights and a-Sundays." Every man who has a dirty boy under him in a hoy is a captain; every man who wears an apron, even of leather, is a "gemman;" and every one who has a Sunday cloth coat is a squire. What has not King Hudson to answer for on this head. How many esquires did he most unscrupulously and unrighteously create. What ruins has he spread abroad over the best suits of artisans and shopkeepers, who could only, decked out in them, call at the post-offices for their squireships' letters! My worthy friends, ye gardeners! keep and be contented with your position. When in business for yourselves ye are tradesmen, and must be satisfied with the fair profits arising from, and the consideration belonging to your trade. When you take the wages of an individual, or a body corporate, you are servants, though, if honest and trustworthy, most commonly favourite servants. That is the state of life in which it has pleased your Maker to place you, and your indulged discontent would be rightly, though impiously, addressed to Him—not to those whose tastes and wealth afford you scope for the exercise of your humble talent, and means of an honest and ample livelihood. *Elpidophorus, Hull.* [This letter requires more notice than we can give it to-day. Another week will produce our views of the writer's arguments.]

A simple and efficacious way of Smoking Glass houses with Tobacco to kill Green-fly.—I have used garden-pots for this purpose for these 10 years. The *modus operandi* is to put a quantity of coke, coal, or short pieces of wood made red hot in the bottom of the pot, and then on these the tobacco paper. That which I use is picked into small pieces before it is put on the hot cinders. The pot is then placed where it is wanted, and the embers blown with a pair of bellows, whose nose is introduced through a hole in the side of the pot near its bottom. Many a time have I lost my dinner, when, being upon 12*s.* a week, I could ill afford it, through the use of these same bellows, and my object now is to introduce to you a plan by which such dire disasters may be prevented, and that is by the use of a porridge pot (in Scotch vernacular)—a tar kettle or plumber's pot (in English). I punch out three holes in its bottom, 1 inch in diameter, and these afford means for a current of air to pass through the fuel. Such an apparatus is easily obtainable, and being cast-iron will last and answer the purpose perfectly for very many years. *James Cuthill, Florist, Camberwell.*

The proper time and best way of Felling Larch Timber.—In No. 51, p. 807, of your last year's volume, "A. B." asks the opinion of some of your correspondents as to this matter. I conceive that the best way would be to chop or saw away at the root (at the same place as the root would be sawn off if the tree were grubbed up), whilst the tree is standing, all the bark and sap-wood, and then let the tree remain standing until late in the next autumn. As the tree will be naturally much enlarged close to the ground, a saw might be entered horizontally all round to the depth of the sap-wood, and then, from the height of 6 inches or more, being chopped down perpendicularly, will remove all the sap-wood there without injuring the stick of timber. I am of opinion that the crude fluid in the alburnum and stem is not sap, nor scarcely resinous, and I think, in spring, the tree thus treated would put out leaf and convert some of that crude fluid into resin, and perhaps deposit some thus converted in the alburnum, and much improve its quality as timber. Certainly timber thus treated would become seasoned, dry, and fit for use sooner than when felled in any other way. If "A. B." has a dozen or so of trees, all of a size, let him serve a third part of them as I suggest; let him fell a third part now, and the other third part at Midsummer, and I doubt not but that the plan suggested by me will be found the best. *J. C. X.* [These *opinions* are not what we and the public want; we require facts and experience, if there be any.]

Tortrix angustiora (see p. 20).—The fact communicated by "Ruricola" relative to the discovery of the larva of this moth in the month of January in a web attached to the withered calyx of a Pear, is interesting, as proving that that species passes the winter in the larva state, ready to commence its attacks upon the young buds and leaves as soon as they are developed in the spring. I say young buds and leaves, because I think no one reading "Ruricola's" account will come to the conclusion that this insect feeds upon the Pear itself, or that it is naturally injurious to that fruit. The nature of the large brown patch is not described, and we doubt whether this was a bruise or a part eaten away by the larva, or merely a dark web spun by the insect. I cannot but think that this was merely an accidental adoption of winter quarters by the caterpillar, which has been mistaken by "Ruricola" (as was also the case with the Odymerus nest in the bee-hive, described by him in this work, 1848, pp. 452, 472) as the natural feeding place of the insect. Were such really the case, the habits of the insect must have been long ago observed, but such a situation, even as a hybernaculum, is contrary to the ordinary economy of insect life. If the Pear were left in its natural state it would fall during the winter, and the larva would find itself in the spring on the ground, surrounded by a mass of rotting vegetable matter, instead of upon the tree in the midst of its real food—the young leaves and buds. Instead however of the economy of this insect being hitherto unknown, as stated by "Ruricola," I beg to refer him to Loudon's "Gardeners' Magazine," vol. 14, where he will find that 12 years ago I published a detailed account of its habits and of the great injury which its larva commits in the spring upon the young buds and leaves of the Apricot. Mr. W. Wing also informs me that he has reared this moth from caterpillars found feeding upon the Whitethorn in the New-road, Paddington, which statement is confirmed by "Ruricola's" having captured the moths on the palings of the Regent's-park, adjoining the New-road. It thus seems that the moth is indiscriminate in its attacks on the foliage of various trees. I may take this opportunity of mentioning that the species of Smynthurus found upon Potatoes and described in this work (1848, p. 764), by Mr. Hardy, under the name of P. Caulastinus, and copied into the "Annals of Natural History" for 1848, has been subsequently published by Mr. Curtis in the Journal of the Royal Agricultural Society (July, 1849, p. 76), as a new species under the name of S. Solani. *J. O. Westwood.*

Rats v. Rabbits.—As a sort of consolation to the gentleman who stated his wrongs concerning the rats in his aviary so pathetically last week, I offer you this state

ment of my own grievances. I have for some time been a great rabbit fancier, and have had a nice outhouse fitted up for their reception, with exercise yard and everything which could conduce to their comfort; but in spite of all this, and although I have had my hutches mounted on tressels with projecting ends, and traps set all over the place, not one rabbit have I been able to rear but five. I have eight does and two bucks, so you may judge of the extent of my sorrows. Nay, so determined have my enemies been to effect the downfall of my establishment, that they have actually bored one of their accursed holes through the floor of one of my hutches at least 15 inches from the ground, and which was placed on tressels, so that no rat "of mortal growth" could possibly climb through the bars. If this says nothing for their honesty, its says a great deal for their perseverance and power of standing upon nothing. Could you, or any of your readers, give me a cure for this nuisance? *A Rabbit Fancier.*

To banish and drive away Rats.—It may be done by stuffing their holes after the following manner, which will banish them away so that they will not return while taste or smell remains. Take one pound of common tar, half an ounce of pearlash, and as much oil of vitriol as will ferment a handful of common salt; mix them all together, spread the mixture thick on brown paper, and lay a piece in the bottom of the holes for them to walk on, then stuff some into the holes and fill them up with lime. Or another way: Get a paper bag full of human hair from a barber's shop and stuff the rat holes with it, they will never appear there again. *W. E., Newcastle-upon-Tyne.*—Rats will prey on plants as well as on birds; an army of these cunning animals visited the greenhouses here last spring, and destroyed many valuable plants; they were not particular in what they attacked; one night, to my surprise, they gnawed off several Coniferous plants. Night after night they visited me, but no clue could be obtained as to their entrance. I found, however, at last, that they had worked their way down to the foundation, and came up by the flue. I set traps in their runs, but Mr. Rat was too cunning for me. He turned another way. I tried the ferret and dogs, but if we killed four, 20 came in search of them. I then began to think my plants were all doomed to be destroyed. I next tried phosphorus pills, but in vain; after that I chopped up fresh beef and seasoned it well with arsenic, and laid it in their runs, but all to no purpose. I recollected that, when a boy, these gentlemen worked their way into my rabbit boxes, and devoured six rabbits in one night, of which nearly all were eaten. The idea therefore occurred to me that rabbit flesh would form a good bait. I procured a young one, and chopped it very small; I then worked white arsenic well into it, and laid it on tiles near their runs over night. In the morning all was gone. I tried this the second night, but after taking such a hearty meal on the first occasion they were unable to finish my second lot; for two or three days afterwards we saw several in a declining state, and they ultimately vacated the premises. *W. Culverwell, Thorpe, Perrow.*

Birds.—As a set-off to "A. A." and his murderous gardener, I may say that since I came to my present residence, about two years ago, I have never had a single bird destroyed. This may be thought the opposite extreme, and perhaps it is; but I find there is plenty for them and for me. I have no doubt they amply repay me, by freeing my garden of innumerable insects and larvæ. As to slugs and caterpillars, such a thing is hardly to be seen. I would not allow my gardener to deprive me of the pleasure of hearing these sweet songsters, and of observing the curious habits of my feathered friends, even if it did cost a few dishes of fruit in the season. I suppose "A. A.'s" gardener would shoot the crows, magpies, and blackbirds, which are now busy in the Grass-field before my windows, doing no harm, I am sure, but probably much good. Surely he can have but little taste for the pleasures of the country, who can thus deprive himself of one of its greatest charms! *C. W.* P.S. My place is not very large, but large enough to harbour a great variety of birds—about 8 acres, one-half of which is gardens, shrubberies, and pleasure-ground.

Amount of Rain which fell at St. Breoke, Wadebridge, during the year 1849, as measured by Howard's rain-gauge:

	Inches.	Wet Days.		Inches.	Wet Days.
January	3.66	24	August	3.50	22
February	2.02	16	September	6.75	13

July	4.02	15			

Henry H. Treby, Jan. 10.

Mr. Cole's Celery.—I see that "Cole's superb solid red Celery" is rather liberally advertised. Will Mr. Cole favour the public by pointing out the difference between it and a sort annually distributed by the Horticultural Society under the name of Celeri Violet. I have cultivated both, and could not perceive the smallest difference between them. *W.*

Societies.

Horticultural, *January* 15.—J. J. Blandy, Esq., in the chair. In consequence of the severity of the weather, very few subjects were exhibited on this occasion.—Messrs. Jackson, of Kingston, sent an unnamed white-flowered Odontoglossum, apparently O. maxillare; and a new, rather pretty, though not very showy, Chorozema, called flavum, was contributed by Mr. Henderson, of the Wellington-road Nursery, St. John's-wood.—Of fruit, Mr. Davis, of Oak-hill, East Barnet, sent three dishes of West's St. Peter's Grape, well-coloured, plump, and finely bloomed, for which a Certificate of Merit was awarded; and, along with them, two bunches of Muscat of Alexandria.—An interesting collection of Pears and Apples (10 of the former and 50 of the latter) was exhibited by Messrs. Paul, of Cheshunt. Among these were some new good-looking kinds; but, as they were not cut up, we cannot state what their qualities might be.—Various garden labels were exhibited. The most novel were some made of what was called metallised gutta percha, the invention of a Mr. Little, of Lockhall, Bath. These were formed apparently by stamping the face of the label so as to press *it* down and raise the *name* up, together with a raised border round it. They were neat enough to look at, but being generally brown they were, perhaps, not so conspicuous a little way off as might have been desirable. They will, however, no doubt prove useful, provided they can be made cheaply and to stand the weather. Another kind was Mr. Morrell's zinc-backed labels, which are now pretty well known. Their advantages consist in their cheapness and legibility when written on either with ink or a soft pencil. And, finally, Dr. Lindley drew attention to a specimen of the old-fashioned stamped leaden label, which, after all, is one of the most lasting, and when the face is nicely painted, so as to leave the sunk letters black, it looks both neat and legible.

Linnean, *Jan.* 15.—The President in the chair. R. C. Gunn, Esq., J. Millingen, Esq., of Van Diemen's Land, Dr. Grindrod, of Manchester, J. D. Jones, Esq., of Hackney, and C. M. Talbot, Esq., M.P., were elected Fellows. Several works were presented by the Messrs. Reeve, in addition to previous gifts of the more valuable works published by their house. J. Curtis, Esq., read a paper on a new species of saw-fly. After some general remarks on the habits of the saw-flies, more particularly the food and habits of the larvæ, which are sometimes parasitical and sometimes form galls, the author described a new species which had just been observed and sent him by Viscount Goderich, F.L.S. He had observed the larvæ in 1846 on some plants of Solomon's Seal, and sent them to the author, but nothing came of them. In subsequent years the larvæ appeared on the same plants, and from these perfect insects were obtained. They turned out to be a new species of Selandria, which the author proposed to name after their discoverer S. Robinsoni. The larvæ were about three-quarters of an inch in length, and formed their cocoons in the earth. The author made some remarks on the structure of the wings of the saw-flies as means of specific distinction. The paper was illustrated by drawings. The Assistant Secretary read a continuation of Mr. Huxley's researches on the anatomy of certain families of the Medusæ.

Microscopical, *Jan.* 16.—The President in the chair. Mr. Woodhouse and the Rev. S. Brown were elected Fellows. Mr. J. S. Lister and Mr. Jos. Gratton were appointed auditors for the ensuing annual meeting. A paper was read by P. H. Gosse, Esq., on the Architectural Instinct of Melicerta ringens, a species of fresh-water Rotifer. After referring to the habits of various animals in building habitations, the author described minutely the well-known case of Melicerta ringens. This case consists of a mass of pellets, which are held together by a glutinous secretion, and in the midst of which the animal resides. The author described beneath the disk of the animal a small rotatory apparatus whose function had not hitherto been discovered, and which he had been able to observe was employed by the animal for the purpose of forming the pellets of which the case was built up. The case had been supposed by Ehrenberg to have been formed by pellets from the alimentary canal, but this was evidently an error. The Chairman announced that the annual meeting and *soirée* of the Society would be held on February 13.

Royal Horticultural of Ireland.—We observe in the *Dublin Advocate* a report of the late annual meeting of this Society, on which occasion it was officially stated that the past year had been a successful one; that in the more useful departments of horticulture increasing competition had taken place; that the number of subscribing members had increased, and that the sum outstanding as arrears was inconsiderable. *To meet the objections so frequently urged against the exclusive character of the Society, the council proposed that a selection from among the nurserymen who had lately joined the Society should be added to that body.* Mr. George Roe congratulated the Society on the fact that the opposition with which they had hitherto had to contend had given way, *and on the demand so long and strenuously made for the introduction of practical men on the council having at last been agreed to, which he conceived would add to the usefulness of the Society.* [Here, then, we have at last a distinct avowal that the complaints which we and others have so often made on behalf of Irish gardeners against this Society were well founded, and that tardy justice is to be rendered to the labourers in the Hibernian Vineyard.]

Reviews.

Species Algarum. Auctore F. T. Kützing, Leipzic, Brockhaus. 1849. Pp. vi. and 922. 8vo.

The number of described Algæ is now so immense that we have reason to be thankful to any one who will undertake to collect together the scattered members. We therefore gladly give our tribute of praise to this author, to whom we are indebted for many beautiful figures and curious observations. We must, however, protest against the careless way in which the labour has in many instances been accomplished, and the ultra views of the necessity of giving to every form specific organic importance; views which, in the present instance, not only disunite species which are all but identical in structure, but absolutely cause different states of the same species to appear in different genera.

We cannot but consider this spirit as extremely detrimental to science; it is bad enough in such genera as Salix, Rubus, &c., where we have the power of comparing many forms at the same glance; but with microscopic bodies the difficulty becomes enormous, even with the help of authentic specimens—so enormous, indeed, as to make it almost matter of impossibility to ascertain the identity of specimens from different localities, and at last results in making every specimen a distinct species.

It would be quite out of place in our journal to enter into details, and we are far from wishing to detract from the real utility of a work which, in the present state of science, is indispensable to every algologist who wishes at all to be *au courant;* our desire is simply to reprobate the love of making species and genera, which, after all, is but a very subordinate part of science; and except it be conducted on very sound principles, and with extreme caution, will lead to no ultimate fame. Experience will soon show the real worth of catalogues prepared in such a spirit, and, when they have served their temporary purpose, they will be thrown aside as unsatisfactory and nearly useless.

Kützing's claims to a high rank amongst algologists are so well established by his "Phycologia Universalis," notwithstanding all its faults, but more especially by his work on Diatomaceæ, which is far the best on the subject, that we are very unwilling that he should impair them by hasty or ill-digested volumes like that before us.

Miscellaneous.

An Inquiry into the Action of Gypsum as a Manure, by M. Caillat.—In the first part of his inquiry into the way in which gypsum acts when employed as a manure, M. Caillat has endeavoured to show that the method of calcination usually resorted to, for the purpose of obtaining the inorganic parts of plants, gives inaccurate results. The weight of the ash does not represent the mineral parts; in consequence of the high temperature to which a plant is exposed when calcined, there is a loss in the quantity of nearly all its inorganic components, and the sulphates especially are, to a great extent, either decomposed or destroyed. M. Caillat, by treating plants, such as Lucerne, Clover, and Saintfoin, with diluted pure nitric acid, succeeded in eliminating nearly the whole of the mineral matters present; so much so, indeed, that when the pulp was afterwards washed and burnt, not more than one-fifth per cent. of ash was left. This small residue consisted of silica and a small quantity of peroxide of iron, both of which are insoluble in the acid employed. This method of proceeding always gave more mineral matter than could be obtained by calcining an equal quantity of the same plants; and it has been thus ascertained that there exists in many vegetables, especially in the leguminous plants used as fodder, much more sulphuric acid than has been hitherto supposed. M. Caillat has ascertained that the loss of sulphuric acid in the process of calcination arises from a partial decomposition of the sulphate of lime; when, for example, he mixed a known weight of pure burnt sulphate of lime with Wheat starch in the form of paste, and calcined the whole, the residuary ash did not yield as much sulphuric acid as the sulphate of lime used contained. He also found, by another direct experiment, that sulphate of lime converted into sulphuret of calcium by the action of organic matter at a high temperature, became, in part, converted into carbonate of lime, under the influence of the oxygen in the air; this oxygen burning at the same time both the sulphur of the sulphuret and a part of the interposed carbon, forms sulphurous acid, which is given off, and carbonic acid, of which a certain portion remains combined with the lime, and thus helps to displace the sulphur. In a future memoir, M. Caillat proposes to examine and compare the mineral substances contained in leguminous plants growing on soils of like nature, but some of which have and others have not been manured with gypsum; and he expects to show that it is probable that gypsum naturally finds its way into the crops which it occasions to grow so quickly. By the above method of treating plants with nitric acid, the silica, which lies in the tissue of the epidermis, was isolated as completely as possible; it was perfectly white. By examining siliceous pellicles taken from some Grasses which, as is well known, contain a great quantity of silica in their epidermis, "I found," says M. Caillat, "that this silica, moulded in the cells of the skin, is very curiously disposed. It exists in little plates, from one to two hundredths of a

millimetre broad, according to the plant, packed side by side, but whose edges are not smooth, but indented very regularly, and thus articulated laterally. This organisation of the silica, which has not, so far as I am aware, been yet remarked, seems to me to be worthy of the attention of physiologists." *Comptes Rendus, Aug.*, 1849. [Compare this statement with Lindley's "Introduction to Botany," Plate I., fig. 6.]

Calendar of Operations.

(For the ensuing week.)

[In consequence of certain inquiries that have reached us in regard to the Calendar, we think it right to state that it is written for the Midland Counties, and that those who live to the South or North of these, must vary their practice accordingly.]

GENERAL REMARKS.

Let advantage be taken of frosty weather to do any heavy work upon the walks or borders, such as carting or wheeling compost or manure on to the ground. In determining what kind of material to use for the improvement of the soil, let due consideration be given to its present quality and condition, and to the particular requirements of the plants, whether vegetables or flowers, which are to be grown upon it during the coming season. A piece of ground which has received nothing for years except the ordinary dressings of dung, decayed leaves, &c., becomes effete, from the want of some ingredients which those manures only slightly contain, or of which they are altogether deficient. In such cases, something should be applied to restore the soil to its natural vigour. A dressing of fresh pasture soil will generally effect this purpose; but as this is not always convenient, burnt clay or charred refuse of any kind forms an excellent substitute; they are also valuable for their mechanical action on the texture of the soil. If this be repeated once in four years the result will be satisfactory; and in the kitchen garden, with the help of liquid manure in summer, an excellent crop of almost any vegetable will be produced. If the land is stiff, sifted coal ashes will be found an excellent mechanical agent in ameliorating its condition, and it likewise possesses the sponge-like property of absorbing any liquid or gaseous matters which may present themselves, giving them off again more gradually as the plants require them.

PLANT DEPARTMENT.

Orchids.—These should be carefully watched at this season, as many of them will be starting into growth. As soon as this is perceived in any plant, it should be repotted or supplied with a larger block or basket if necessary. In shifting Stanhopeas or other Orchids which send their flower-stems through the soil, very shallow wire baskets should be used without potsherds, charcoal, or other impenetrable material. I find them succeed admirably in lumps of fibry peat, from which the soil has been shaken out, mixed with rough, flaky leaf-mould, and plenty of clean sand, which is necessary to keep the leaf-mould and peat from becoming too spongy. The surface of the soil and the inside of the basket should be lined with sphagnum, which protects the roots from sudden gleams of sunshine, prevents the soil from falling out, and, by its powers of absorption, keeps itself and the soil sufficiently moist. That the roots are satisfied with it is evident from the beautiful network which they form throughout its entire surface. Maxillarias, Lycastes, Gongoras, &c., succeed better when treated in this way than they do in pots, but to the soil of these a good proportion of charcoal and potsherds, or pieces of sandstone, may be safely added, as their flower-stems are altogether above the soil. The sphagnum absorbs nearly sufficient moisture from the atmosphere of the house, and by doing away with the necessity of watering, extremes are avoided, and the soil is kept in a uniform healthy state. Those plants which do not require shifting, should be surfaced with a little of the same material as would be used in removing them to larger pots, or baskets. As soon as any plant is potted, or top-dressed, it should be dipped into the warm water cistern, that the whole of the peat, &c., new and old, may be thoroughly and equally moistened. In performing this operation, the pot or basket should be gently lowered into the water, so that it may gradually rise amongst the mass. If a little trouble is taken in this matter, any woodlice, or other insects, which are harbouring in the soil, will retreat before the rising water, till they come out on the surface, whence they may be easily removed. Syringing will be useful on fine mornings; but this should be made to fall on the plants like a gentle shower of dew, instead of being driven into them with a man's full strength. The plants which are attached to blocks will need an occasional slight syringing, to prevent them from shrivelling, as it is yet too early to keep up a sufficiency of moisture in the atmosphere. Water must be very carefully used, and should always be of the same temperature as that of the house. The rain which falls on the roof should be conducted into a tank within the house; it is preferable to river or pump water, which generally contains eggs of insects injurious to Orchids. For the further protection of the plants from their ravages, the peat and leaf-mould should be thoroughly baked, and the sphagnum immersed in boiling water, in order that all animal life may be destroyed before they are used. This points out another advantage which the wire basket has over the bundle of old fungus-coated sticks in which plants are commonly suspended; the latter, besides being unsightly, affords a certain harbour for insects. As the plants commence their growth, remove them to the warm end of your house, if you have only one; but it is impossible to grow them to perfection unless you are able to keep the dormant plants cool and dry, and those in a growing state comparatively warm and moist.

FORCING DEPARTMENT.

Peach-house.—From the time when the blossoms of Peaches begin to expand, maintain a steady night heat of 50°, not rising higher than 60° during the day, unless by sun heat. Syringing must be avoided until the bloom is set. If the external temperature is not too low, fresh air should be admitted every day in sufficient quantity to produce circulation, but cold currents must be carefully avoided. If the early Melon bed is not made, it should be immediately attended to. It should be constructed in such a manner as to secure a bottom heat; if you have not hot water at command, this should be effected by means of outside linings, and a dung chamber beneath the bed. Where Cherries are required early, the house should now be in proper order, as regards cleaning and painting; the temperature should be kept at 45° by night, and 55° by day, with air, until the buds begin to expand, when a rise of 5° should gradually take place. The fruit will set with the low temperature of 50° by night, and 60° to 65° by day. No kind of fruit requires greater care in forcing than this, as any excess of heat will prove ruinous. Air is indispensable during the day, while the trees are in flower; and even during the night, when the external air is not very cold. Bear in mind the hardships they have to endure out of doors; this will show the necessity of avoiding undue excitement.

FLOWER GARDEN AND SHRUBBERIES.

If the advice given in August and September of last year has been attended to, by deciding upon the arrangement for the different portions of the flower garden, and also by noting the number required of the different kinds of plants, an inspection of the stock at the present season will show of what kinds there is a deficiency, and thus determine what quantity of young plants have to be propagated between this time and the end of April. But if memoranda were not made at the time recommended, it should be done before the season is farther advanced. Bouvardias, Salvias, Lobelias of the section to which propinqua belongs, and other half-hardy deciduous plants should now be looked over, and if the stock of any is deficient, it should be increased by the usual means. During this severe weather preparations should be made by getting soil, pots, and crocks ready to pot off plants in store pots of such things as fancy Geraniums which are found so suitable for bedding. Amongst these varieties we may recommend Anais, Jenny Lind, Hero of Surrey, Jehu superb, Nosegay, Bouquet de Flore, &c. In the meantime let them be duly attended to in regard to watering, and by removing any decayed leaves, and stopping long weak growths, to induce the formation of bushy plants. As the flower garden is very deficient at this season in a display of flowers, let extra attention be paid to keeping every part of it in a state of perfect neatness.

FLORISTS' FLOWERS.

We hope the advice given last week has been attended to; it has been capital weather for "sweetening" soils and subjecting them to a thorough freezing. As an in-door employment, look through the collection of Ranunculus roots, and, if not already done, divest them of all dead fibres and thoroughly clean them. Where desirable, the offsets may be kept separately, for we always like to have a "nursing bed" of small roots, which gather strength for next year's bloom. Should the frost break up during the coming week, we may possibly have much rain. The stock of Auriculas, Carnations, &c., must be kept from its effects as much as possible; for it often happens that frost will return with considerable severity, and should the plants in frames have been soaked, it will be much to their disadvantage. Those who wish to propagate Dahlias extensively may now put the roots in gentle heat, to start them.

KITCHEN GARDEN.

Success in our gardening operations, as in the numerous other affairs of life, depends very much on careful attention to small matters, many of which, if examined individually, appear trifling; but if omitted or neglected, prove detrimental to the attainment of our hopes. Amongst the little things to be looked closely after at this season of the year, the garden snail (Helix aspersa), the common grey slug (Limax cinereus), and their congeners, may rank first. These hide themselves in the earth, box edgings, and other snug corners, till warm weather occurs, when they come forth and attack every vegetable in their way. On a mild day, hundreds may be seen crawling over the walks, of which a great number may be picked up by a quick boy, as they frequently continue visible during the whole of the day at this season. By beginning to destroy them thus early the ground is comparatively freed from these ravagers by the time our young plants appear in spring. Sea-kale forcing is most profitably done by means of a slight hotbed of leaves and litter with a frame upon it; by covering with wooden shutters the bleaching is ensured; 53° to 55° is sufficient for top heat. Look closely after Endive in damp weather, and remove all decaying leaves. Examine Cauliflowers and Lettuces in frames, and dust a little quick-lime amongst them if it is necessary. Give plenty of air on all favourable opportunities. Make a sowing of Radishes under a south wall, and when they come up protect them with a few evergreen boughs.

State of the Weather near London, for the week ending Jan. 17, 1850, as observed at the Horticultural Garden, Chiswick.

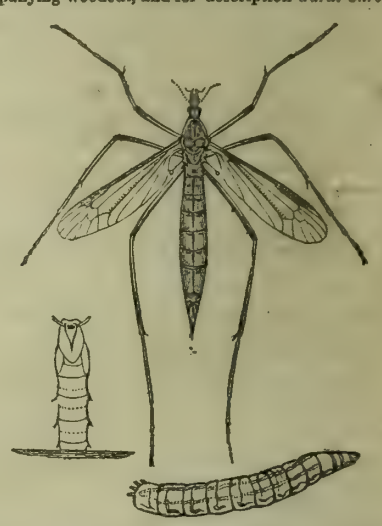
The highest temperature during the above period occurred on the 20th and 22d, 1828; 22d and 25th, 1846—therm. 56 deg.; and the lowest on the 20th, 1838—therm. 7 deg.

Notices to Correspondents.

Agapanthus umbellatus: *A H.* It is probable that it will prove hardy in 18 inches of water. At all events, the experiment is well worth a trial. ‡

Ammonia: *Anon.* Plants absorb the carbonate both by their leaves and roots, but especially by the latter, to which it is conveyed by manure or dissolved in water.



Coins: *J R C.* Such questions as yours do not concern the objects of this Paper. ‡

Figs: *G S.* You will not be likely to succeed in growing Figs under Vines in so small a space as 15 feet by 7, covered with glass. Better form a chalk subsoil, from 12 to 18 inches deep, and grow them out of doors. Without artificial heat, you can only expect to ripen, in the ensuing summer, the latest formed fruit on the extremities of last summer's shoots. ‖

Gesnera: *J T.* It is strictly a stove plant. You had better look to the roots, where, we presume, the mischief will be found to lie.

Grapes; *G S.* Although Frontignans in Vineries require fire heat, yet you may succeed in ripening those without it which you have planted in a frame, because you can cover it at night. In sunny weather your frame, containing a small quantity of air compared with the surface of glass, will frequently get excessively hot, unless great attention be paid to ventilation. ‖

Insects: *J D.* The insect found on the Cactus is a Typhlocyba, a genus allied to the froghopper or cuckoo-spit insect, and which is incapable of committing the injuries you describe. *W.*—*Pedicia rivosa.* It is most probable from your description that the young Cabbage roots have been eaten by the larvæ of the common daddy-long-legs, Tipula oleracea (see the accompanying woodcut, and for description *Gard. Chron.* for

1841, p. 612.) The larva of the cockchaffer has six legs, and is thick, curled, and fleshy. The ichneumon larvæ are white, fleshy, and destitute of legs, but are found in the bodies of other insects. *W.*—*E T W.* The caterpillars infesting the grains of Wheat are those of the moth of Noctua cubicularis, which we have received from other parts of the West of England. We can suggest no other remedy at the present season than careful examination and hand picking. *W.*

Lettuces: *Montgomeriides.* Steep your old Lettuce seeds in pure water for 12 hours before sowing; but it is very doubtful whether any vitality remains in them. ‖

Names of Plants: *G S.* Schinus Molle.—*M*—*l.* Trichocentrum tenuiflorum.—*P P.* Galeottia Beaumontii; the genus is extremely near Batemannia, and perhaps not really distinct.—*Troublesome.* Limonia Laureola, a fine thing; is it hardy? Tell us all about it.

Pruning the Peach-tree: *G S.* A young shoot must be trained from the base of the one which bears the fruit, in order to supply the place of the latter, which must be cut away at the winter pruning. A similar proceeding has to be repeated, tending, as you observe, to produce a long naked snag. But it often happens, that even at the base of this some buds that have remained in a latent state for years break out; and by taking advantage of these, a young shoot is obtained, having its origin almost close to the main branch, and then the adjoining snag can be cut away. ‖

Seeds: *N.* We cannot recommend dealers. ‡

Temperature: *G S.* The thermometers employed for registering the maximum and minimum temperatures at Chiswick are placed at a distance from any wall or building. They are Rutherford's, made by Newman, and agree with others in the neighbourhood, excepting occasionally; when the latter indicate slight differences they may be traced to the effects of radiation from buildings. ‖

Misc.: *A Market Gardener.* No circulating library of horticultural works exists that we know of. We are unacquainted with anybody likely to suit your purpose. We would advise you to advertise for a man. ‡—*G P.* You can have the numbers mentioned. The price will be 3*s.*

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

ANNUAL COUNTRY MEETING OF 1850,
TO BE HELD AT EXETER.
PRINCIPAL DAY OF THE SHOW, THURSDAY, JULY 18.

PRIZES AND REGULATIONS FOR AGRICULTURAL IMPLEMENTS.

The Prizes are open to General Competition: Members have the privilege of a Free Entry; and Non-subscribers are allowed to compete on the payment of 5*s.* on each Certificate.

Forms of Certificate to be procured on application to the Secretary, 12, Hanover-square, London. All Certificates for the entry of Implements, &c., will be required to state the total number of articles entered to be shown by each Exhibitor, and the space required for their exhibition, and must be returned, filled up, to the Secretary, on or before the FIRST OF MAY, 1850; the Council having decided, that in no case whatever shall any such Certificate for Implements be received after that date.

PRIZES.

For the Plough best adapted for general purposes, 7*l.*
For the Plough best adapted for deep ploughing, 7*l.*
For the best One-way or Turn-wrest Plough, 5*l.*
For the best Paring Plough, 5*l.*
For the best Subsoil Pulveriser, 5*l.*
For the best Drill for general purposes, which shall possess the most approved method of distributing compost or other manures in a moist or dry state, quantity being especially considered, 10*l.*
N.B. Other qualities being equal, the preference will be given to the drill which may be best adapted to cover the manure with soil before the seed is deposited.
For the best pair-horse steerage Corn and Turnip-drill, 10*l.*
For the best Drill for small occupations, 5*l.*
For the best Turnip-drill on the flat, which shall possess the most approved method of distributing compost or other manures in a moist or dry state, quantity being especially considered, 10*l.*
N.B. Other qualities being equal, the preference will be given to the drill which may be best adapted to cover the manure with soil before the seed is deposited.
For the best Turnip-drill on the ridge, which shall possess the most approved method of distributing compost or other manures in a moist or dry state, quantity being especially considered, 10*l.*
N.B. Other qualities being equal, the preference will be given to the drill which may be best adapted to cover the manure with soil before the seed is deposited.
For the best drop Drill, for depositing seed and manure, 10*l.*
For the Manure-distributor which is best adapted for distributing broadcast any kind of compost or hand-tillage when in a moist state, and which is capable of adjustment for the delivery of any quantity, from 2 to 20 bushels per acre, 5*l.*
For the best portable Steam-engine, applicable to threshing or other agricultural purposes, 50*l.*
For the second best ditto, 25*l.*
For the best portable Threshing-machine applicable to horse or steam power, 20*l.*
For the best Corn-dressing Machine, 10*l.*
For the best Grinding-mill for breaking agricultural produce into fine meal, 10*l.*
For the best Linseed and Corn-crusher, 5*l.*
For the best Chaff-cutter, 10*l.*
For the best Turnip-cutter, 5*l.*
For the best Oilcake Breaker, for every variety of cake, 5*l.*
For the best One-horse Cart for general purposes, 10*l.*
For the best Light Waggon for general purposes, 10*l.*
For the best Machine for making Draining Tiles or Pipes for Agricultural purposes. Specimens of the Tiles, or Pipes, to be shown in the yard: the price at which they have been sold to be taken into consideration, and proof of the working of the Machine to be given to the satisfaction of the judges, 20*l.*
For the best Set of Tools for General Draining, 3*l.*
For the best Heavy Harrow, 5*l.*
For the best Light Harrow, 5*l.*
For the best Cultivator, Grubber, and Scarifier, 10*l.*
For the best Pair-horse Scarifier, 5*l.*
For the best Horse Hoe on the flat, 10*l.*
For the best Horse Hoe on the ridge, 5*l.*
For the best Horse Rake, 5*l.*
For the best Horse Seed-dibbler, or Seed-depositor, not being a drill, 10*l.*
For the best Cider Mill, 10*l.*
For the best Barrow Hand Drill, to work with cups, 3*l.*
For the best Liquid Manure Distributor, 10*l.*
For the best Haymaking Machine, 5*l.*
For the best Gorse-bruiser, 5*l.*
For the best Cottage Stove or Range for burning coals, 5*l.*
For the best and most economical Steaming Apparatus for general purposes, 5*l.*
Miscellaneous Awards and Essential improvements, Silver Medals estimated at 20*l.*
For the invention of any New Implement, such sum as the Council may think proper to award.

By Order of the Council, JAMES HUDSON, Secretary.
London, August 7th, 1849.

*** Prize Sheets, containing the Conditions of these Prizes, and the Regulations for Competition, may be had on application, by post or otherwise, to the Secretary, 12, Hanover-square, London.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, January 21, 1850, at 2 o'clock precisely, about 1700 tons of damaged PERUVIAN GUANO, in Warehouse, ex sundry ships, by order of Messrs. Anthony Gibbs and Sons, the Importers.—Catalogues and further particulars in due time from Messrs. J. A. RUCKER and BANCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
London, January 19.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.
GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY, and Make the Animal look Better than when Paying 12*s.* and 14*s.* per Week.—Consider the enormous saving in these hard times—times of cheapness.—Apply personally or by letter at MARY WEDLAKE and Co's, 118, Fenchurch-street, Oat-bruising and Chaff-machine Manufactory, established upwards of 40 years.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA. EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.
HEATING BY HOT WATER.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

The Agricultural Gazette.
SATURDAY, JANUARY 19, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Jan. 24—Agricultural Imp. Society of Ireland.
THURSDAY, — 31—Agricultural Imp. Society of Ireland.

THE "PRESENT PRICES" excite very different emotions in different minds; and there are many we may be sure who are heartily and naturally rejoicing at the very causes which are spreading despondency amongst ourselves. But whatever the nature of the feeling produced, retrospect may yet show it to have been of very unnecessary intensity: and it may yet come to be seen that the connection between present prices and future prices is just as slight and uncertain still, as it has always hitherto been throughout the history of that most variable and inconstant of all things—the Corn Trade. And we believe that the very *uncertainties* of our position, by which so many are depressed, might thus be made a reasonable groundwork of hope.

Nevertheless, it is of course most proper to be prepared for the worst, and lest present prices should represent future experience too, it becomes a problem of the very highest importance—"How to produce Wheat at 5*s.* a bushel and meat at 5*d.* per lb.?" Let no one think, because, at those prices, his receipts in any or every year since he commenced business would be diminished by a sum more than the remission of his whole rent and taxes would replace, that therefore this problem is incapable of solution. For, to take the case of another manufacture, how clearly, on the very same ground, would the present *profitable* prices of cotton goods have, long ago, appeared ruinous, the cost of the labour and the raw material alone employed in the production of a given quantity then being far beyond the sum which that quantity would command in the market now. The cheapening in this case followed and indeed resulted from the constantly increasing skill and economy of the process; and although in our own case, most unfortunately, it has preceded that out of which alone, by right, it ought to have arisen, yet we may reasonably imagine that here, too, expenditure may be sufficiently reduced, and produce sufficiently increased, to meet our altered circumstances; and that present prices only put us in the position to which mutual competition, and our own increasing skill, would, in the ordinary course of things, have ultimately brought us. No doubt, we are not so well prepared for that position now as we should have been then; but the concession that that position is not necessarily fatal is all we at present desire. For all we yet claim to have proved is, that our proposed problem is not only absolutely forced upon our attention by the circumstances of our case, but that it is one which might reasonably, under any circumstances, have become the subject of examination. That there is no *primâ facie* absurdity about it must indeed be evident to every practical man who will take the trouble to consider the ordinary routine of farm operation, and see what wastefulness of means every part of it still exhibits.

Now we do not know of any instance in which this problem has yet been solved, or we should simply have to detail the particulars of the process for general imitation. Direct experience of the result has not yet spoken upon the subject, and therefore we have to content ourselves with demonstrations founded upon details. Of course if all the details be included, and each be absolutely true, such demonstrations will be perfectly trustworthy: it is the extreme liability to imperfection and inaccuracy of the premises with which agricultural demonstrations deal, that the conclusions arrived at by reasoning on these subjects are not always verified in the experience of the farmer. We can, however, only do our best to attain accuracy, and then we must just put such confidence in the results attained as the knowledge of this liability to error will permit—feeling certain, all the while, that any help, however imperfect, to the anticipation of a satisfactory experience, is far better than that absolute blindness under which so many seem ready to sit down in despair.

These remarks are introductory to a notice of Mr. HUXTABLE'S lately published pamphlet on "Present Prices,"* which is already, as it deserves to be, in its third edition. Setting aside the speculations of the author regarding the causes of the present lowness of the prices of agricultural produce—a topic upon which we do not intend to enter—let us just examine the argument by which he professes to have demonstrated its compatibility with agricultural prosperity. He has not *experienced* this compatibility; but he believes in it nevertheless. There is nothing absurd in that. No doubt, if any one saying "I will show you how to grow cheap food," could add, "Here are my farm accounts for the year, detailing the process and its result," he would be more eagerly listened to; but that should not hinder us from attending to the same assertion by another who only adds, "These are the reasons for which I believe the thing to be possible." Of course, the value of the teaching in such a case depends wholly upon the soundness of the "reasons" that are given. If they are trustworthy, so must the result be, to which they lead. Now the reasons which Mr. HUXTABLE adduces for his belief are all founded on experience; the experience, no doubt, to some extent, of the chemist, but still *experience*, and therefore, supposing it to be rightly recorded, unquestionable, as far as it goes. Mr. LAWES, of Rothamsted, he tells us, after labouring in his fields and feeding stalls for nine years, carefully applying manures and measuring vegetable growth, and administering food and measuring animal growth, and after working with Dr. GILBERT for as long in the laboratory, analysing manures, produce, soils, and foods, has come to the conclusion, that in the ordinary circumstances of most soils, and of growing animals in the long run, land and food are both dependent for their production of growth almost wholly on the presence in them of nitrogen; in the former case on nitrogen in the form of ammonia, and in the latter on nitrogen in the form of that part of food called protein and its compounds. He has also come to the conclusion that, out of every 10 lbs. of nitrogen thus used in the manufacture of Wheat and other cereal grains, hardly 4 are assimilated, 6 or more going to waste; and that of every 10 lbs. used in the manufacture of meat, hardly 2 are assimilated, 8 or more being rejected in the manure of the animals that are being fed. The former of these conclusions is supported, not only like the latter, by actual investigation of the facts, but by the consideration that ordinary land merely tilled, receiving no manure, is found able to yield *annually* a crop averaging 16 bushels of Wheat per acre—a quantity whose nitrogen corresponds in the proportion stated to that which the soil annually receives in the ammonia of the rain water which falls upon it. If the straw of this Wheat crop, instead of being always removed as supposed, be returned to the land, then for every bushel of Wheat that the soil is to produce beyond the 16, it must be supplied with about 5 lbs. of ammonia—a quantity sufficient, in the proportion named, to furnish the nitrogen which a bushel of Wheat is found actually to contain.

All these details are specified by Mr. HUXTABLE, and he uses them thus:—Supposing Wheat to be worth only 5*s.* per bushel—in the case of a crop of 32 bushels per acre, 16 bushels more than the unassisted yield of the land, such a quantity of ammonia will be needed to produce it as, at the present market price of the article, is worth 1*l.* 11*s.* 3*d*—then adding this to 4*l.* 10*s.* 3*d.*, at which (*including* rent and taxes, 1*l.* 8*s.* 4*d.*) he estimates the cost of cultivation per acre, he obtains a total which, deducted from 8*l.* (the value of the 32 bushels), leaves 1*l.* 18*s.* 6*d.* per acre for interest on capital and for profit—a conclusion which, supposing it to happen biennially, and the alternate crops just to pay their way,

* "The Present Prices," by the Rev. A. Huxtable. London: Ridgway, Piccadilly.

would leave the tenant of the land better off than even that most jealous of judges, the Income Tax Bill, supposes him to be.——But—"The rent is too low for the supposed produce"—"the cost of cultivation is not put high enough"—"green crops will *not* pay their way." All these objections are considered by the author: the rent is that of land actually worth only 20*s.* per acre, exclusive of tithe, &c., and which was *proved* to yield 16 bushels of Wheat annually without manure—but we will suppose that, as land now lets, it *is* too low, then we are perfectly ready to concede that rents must be lower than they now are, if prices continue poor as at present; this subject, however, we shall discuss hereafter; the other objections we are also ready, in some measure, to admit; for the cost of cultivation we do not think has been placed high enough—though we cannot now say why; and on the large scale and long run we have *not* found our green crops to pay their way. But, we must remember that there is a large margin —1*l.* 11*s.* 3*d.* per acre among the details of cost—which is supposed to be spent in the purchase of ammonia, though that ammonia need not be purchased; for, by the consumption of the green crops, we obtain a supply of it in the manure of our feeding stock. And, though in the course of years we have spent more on our green crops than we ever *directly* received from them, yet we believe, and we are beginning to experience, that this has arisen merely from want of the necessary skill. There are districts where Turnips are grown and consumed with a profit—*that* is certain; and there are many instances in our own experience where 9*s.* and 10*s.* per ton have been made from them in beef and mutton, beside all the ammoniacal manure which Mr. HUXTABLE supposes us to buy for our Wheat crop. And though, during the present winter for instance, we do not believe that all the green food for cattle in the country will furnish a money result to the consumer of more than 5*s.* per ton, yet we believe that a great deal is easily possible in the way of liquidating or even more than repaying the annual charge per acre of green crops on the farm, both by a greater skill in consuming them, which will yield more money per ton, and by a greater skill in choosing and growing them, which will produce more tons per acre. Mr. HUXTABLE, however, is confident that in making both beef and pork, and selling them at 5*d.* per pound, he has himself obtained results far exceeding the cost of the means employed, leaving therefore a profit to the farmer over and above their supply of manure, containing ammonia, said to be worth 6*d.* per pound, for the profitable growth of Wheat at 5*s.* per bushel.

But on this, though we believe it to be the most valuable portion of this truly interesting pamphlet, we must not detain the reader. Let him obtain the work and study it for himself. He will find it to contain details of the most interesting experience, obtained both on the farm and in the laboratory; and—it may be, with all his convictions unbroken (for they are not assailed) on Protection as a matter of expediency or even of justice to the farmer, and on rents, that, if prices continue low, they must fall —he will, we are sure, rise encouraged from its perusal, hoping that, after all, agriculture is not in the long run to be a ruinous business, and that better times are in store for the cultivators of the soil.

The subject of true agricultural economy on which these hopes can find their only right foundation—one which can be profitably discussed in great detail—we shall endeavour to take up hereafter; and that of the present rents of land, an equally important topic, we must reserve for a future opportunity. Meanwhile we conclude with the assertion, that—independently of the fact that, whatever the lowness of prices may be, profits *will* be made when the raw material of the manufacture shall have assumed the natural value to which a lessened competition will most surely bring it—we believe that the intelligence which, however it may regard the ultimate results hitherto of agricultural experience, sees hopeful truth in many a point which that experience contains—the intelligence which sees *useful* truth and reality, not merely guesswork and plausibility, in the results of *Chemical* experience, and in the character and tendencies which it reveals in those atoms with which the farmer deals—this intelligence will, when united with a thorough-going energy and industry, carry us successfully through the present critical period of agricultural history.

THE PRIVATE MONEY DRAINAGE ACT.

TO THE RIGHT HONOURABLE LORD JOHN RUSSELL.

MY lord, it is now nearly three years since I had the honour of bringing under your lordships' notice a suggestion for a bill, to enable the proprietors of settled estates to borrow money from private sources for the drainage of their lands, and also for building appropriate farm buildings, and to charge the amount so expended on the inheritance, as a rent charge, terminable in a certain limited number of years; the annual instalment being so regulated as to repay principal and interest in the time specified.

During the last session of Parliament his Grace the Duke of Richmond took up the subject, and brought in a bill "The Private Money Drainage Act, 1849," which has now become law, embracing the principle of my suggestions, in so far as they related to drainage, and it is almost needless for me to say that that measure has been hailed with satisfaction by the landed interest generally.

It is to be feared, however, that in consequence of a defect in the arrangement of the bill to which I have alluded, it may not be so generally useful as it might otherwise have been. The defect to which I refer, is the want of some provision for a receivership of that portion of the rent charge which goes to repay principal. There are few parties who are willing to lend money to be repaid in the manner specified. Parties who lend generally wish their capital to remain undisturbed, they only receiving the annual interest. This defect in the bill must therefore narrow the number of lenders to those persons or societies who trade in money; and thus, while enhancing the rate of interest to the borrowers, deprive the small capitalist of a safe, convenient, and profitable means of investing his money, in the improvement of his neighbour's land.

I need hardly point out to your lordship the great advantages which would have resulted from the full operation of such a measure during the present season. It would have furnished employment for the large masses of agricultural labourers now out of work, while the increased consumption, consequent upon their earning of wages, might, in some degree, have enhanced the prices of agricultural produce, and, at all events, would have furnished more ready markets. It would also have been an early step towards that improved system of agriculture, which, it is admitted on all hands, must spread itself over our fields, if the landed proprietors are not to have their incomes materially curtailed.

As it seems probable that the "Private Money Drainage Act, 1849," may be brought before Parliament in the ensuing session for amendment, I am now desirous of respectfully urging upon your lordship's attention the great benefit which would accrue to the country generally, by the early passing of a thoroughly practical measure for enabling the proprietors of settled estates to borrow money from private sources, not only for draining their lands, but also for erecting proper and suitable farm buildings, and, under sufficient guarantees, to make its repayment a terminable charge on the inheritance.

In bringing this subject under your lordship's notice, I know that I shall be borne out by all the practical men in the country, when I say that any outlay judiciously made in providing good substantial farm buildings, would be more than repaid within 22 years by the accruing advantages. If, therefore, such a measure as I have indicated were passed, and largely taken advantage of, the country would, at the end of a limited time, be fitted out with excellent farm buildings, at absolutely no cost, either to individuals or the public.

The two great requisites towards profitable agriculture are a highly cultivated soil, and proper accommodation for preparing and converting its produce. The one is as necessary as the other. Half the advantages of draining are lost, if the increased produce is brought home to be consumed in ruinous ill-conditioned buildings. Nor will it be doubted, that the constant association with confusion and filth, and their accompanying waste, has a directly injurious effect on the mental condition of farmers occupying such buildings; tending, very much, to repress and eradicate all ideas of order and regularity, so necessary to success in agriculture as well as in other occupations; yet it cannot be denied, that a large proportion of the farm buildings of the country are in the condition I have adverted to.

I am not unaware that the extension of the measure of last session to buildings, received the consideration of a section of Parliament; and that it was not thought desirable to include them in the bill at that time, in consequence (as was supposed) of the difficulty of controlling the expenditure. I cannot believe that there can be any difficulty, not easily surmountable, on that point. The same machinery which oversees the drainage expenditure, could with equal, or perhaps greater, facility, overlook the erection of buildings. The commissioners might be restricted to granting rent charges only for such buildings as were decided by the bill itself to be suitable for the different descriptions and sizes of farms, and of a plain but substantial description (and this might be arrived at by the examination of a few competent witnesses); leaving it, however, in the option of the proprietor to extend, embellish, or modify as he pleased (provided the substantial nature of the work were not interfered with), on making a money contribution, for which no rent charge would be granted, equal to the increased cost caused by his alterations of the plan. A quinquennial inspection, and powers of compelling the necessary repairs to be made, would add little to the expense, and would afford a perfect security for the reversioner.

It is not for me here to advert to the laws which restrain the alienation of land. That these laws have been the means in some measure of retaining in influence and power great names, which have formed rallying points for the country in times of difficulty and danger, no one can doubt. While, however, we retain these laws, it must be obviously for the interest, not only of the landed proprietors, but of the country at large, that obstacles to the application of capital to agricultural improvement should be removed to as great an extent as possible, consistently with good faith towards existing engagements.

In conclusion, I only regret that it has not fallen to a less humble individual than myself to bring this subject under your lordship's notice, as I firmly believe it to be a matter of great and vital importance in the present crisis. I have the honour to be, your lordship's most obedient humble servant, *John Girdwood, Chirk, N. Wales.*

ECONOMY IN FARM MANAGEMENT.

IT is objected to yourself and others, who urge the adoption of what is called high farming, as a resource whereby to meet the reduced prices of farm produce, that the capital is wanting to carry out a better system. However this may be, it will not I think be disputed, that it is the imperative duty of every farmer who desires to stand well in these times, to adopt resolutely whatever methods and arrangements are the most economical, though they require the change of old established customs. It may be an encouragement to many who are at a loss to discover in what way they are to meet diminished prices, without having capital to increase the produce of their farms, to point out and bring to their recollection the means of retrenchment, which lie within their reach. For instance, now is the time to resolve that a pair of good horses harnessed abreast, shall do as much or more work at plough than three or four in a string now do. This is perfectly within the power of most farmers, and by adopting this change they save additional horses and drivers, or if the same number of horses must be kept, they get through the work quicker, and are enabled to employ more ploughs whenever the land is in the best state for working. If the system of saving horse labour and extra drivers were carried out by adopting light carts, instead of waggons and the waggoners' boys, this department of expenditure would be placed on a good footing.

Another item of saving may be in very many cases made in seed corn, for whilst one man finds 4 or 5 pecks of Wheat, 6 pecks of barley, and the same of Vetches, sufficient seed to ensure excellent crops, and to allow of horse-hoeing between them, can we pity those who needlessly waste what they might keep in their own pockets? Again, as in the sowing of grain crops, so in the harvesting the same, a saving may be made, if the land is clean as it should be, by mowing or otherwise cutting the crop close to the ground, and thus saving the additional expense, which we see every year incurred in some parts, of mowing and harvesting a crop of stubble. This slovenly practice, quite unknown in well farmed districts, must be dispensed with before any tenant can have a claim to reduction in his other payments.

The way in which the food of animals and their manure is wasted by exposure to wet, cold, sun, and wind, is a matter which can be completely rectified only by the aid of the landlord; by his providing suitable buildings for housing stock, &c. Still, the intelligent tenant may help himself in some measure. Let him dig out the ground under some of his open sheds, put two or three poles across, at 8 or 9 feet distances, and put up some thatched hurdles in front. He will then have, at the expense of a few shillings, and a little labour of himself and his men, a sort of box-feeding shed, in which he will find his beasts thrive on less food, and the dung incomparably better made than when it consists of little else but wet straw in an open yard. I saw lately some splendid dung made, equal I suppose to the best guano, at no cost to the tenant, as follows. At the back of a house in which beasts were tied up to fat, were openings in the wall, closed by wooden shutters. On the outside of this tie-up house was sunk a pit, 7 feet deep, 17 feet wide, and the length of the house where the beasts were, viz., 35 feet. Into this pit the dung from the beasts was thrown through the openings at the back, and the drainage from them ran into it also. The pit was covered with a lean-to, resting on brick pillars rising from the centre of the pit, where a valley was formed, and from this the roof rose again to about 6 feet above the ground, and the pit was closed in on the sides and front, having shutters to open, out of which the manure could be thrown as required. In this pit 20 pigs were fatting, and said to thrive remarkably well, having a little clean litter thrown over the dung occasionally, which is kept well trodden down by their weight till it rises to the surface of the ground, and the pit is full. This, again, requires the help of the landlord. It was the tenant's practice to mix it under another shed with peat or ashes of burnt clay, and to apply from 5 to 7 bushels of the mixture per acre. He said that sometimes the beasts and pigs made a good profit, but always had cleared themselves, leaving him I calculate above 150 cubic yards of stuff equal to guano, for nothing! Surely some such means of making and preserving good manure, worth the labour of carting out, is an object for which a tenant should not be unwilling to pay a liberal interest on the expenses of building.

Another diminution of expense which low prices naturally bring with them is in the item of labourers' wages. Here it will be the natural desire, as well as the interest, of the good farmer, to manage so as, whilst relieving himself, to diminish as little as possible the comforts of the industrious labourers. A nobleman of much experience in these matters has proposed a plan for lightening the farmers' payments without allowing the whole loss to fall on the labourer, which is this, viz., suppose the rate of wages previous to reduction to have been 9*s.* per week, it is proposed in future to pay

of this 4*s.* 9*d.* per week in money, and to give 2 stones of flour to the man in lieu of the remainder. The calculation would then be about as under.

Former rate per week.	Proposed to pay in cash.	Value of 2 stones of Flour to Farmer.	Total cost of Wages to Farmer.	Value of 2 stones of Flour to Labourer.	Total value of Wages to Labourer.	Positive reduction to Labourer.
s. *d.*	*s.* *d.*	*s.* *d.*	*s.* *d.*	*s.* *d.*	*s.* *d.*	*s.* *d.*
9 0	4 9	3 0	7 9	3 6	8 3	0 9
10 0	5 8	3 0	8 8	3 6	9 2	0 10

And so on reducing 1*d.* for each 1*s.*, or about 8½ per cent.

If it is thought the labourer should bear a greater deduction than the above, the money part of the payment, can be varied accordingly. The cost of a bushel of Wheat is above estimated at 5*s.*; and that it produces 3stone 2lbs. of flour, the bran paying the expense of grinding. A great relief would be experienced by the farmer, and it would tend very much to the comfort and respectability of the labourer, could the custom of paying more extensively in kind, instead of in money, which is universal in the north of England and Scotland, be introduced more generally.

Another payment which is diminished to the farmer by permanent low prices of grain is the tithe; and others ought to follow, such as the price of beer, and tradesmen's bills generally; and when middlemen of all sorts are obliged to cheapen the articles which they sell, such as butchers' meat, bacon, bread, cheese, &c., the additional consumption, with an increasing population and flourishing trade, will no doubt benefit the farmer.

The last means of economy, as regards landed property, which I will allude to at present, less directly affects the tenant, but must surely force itself upon the serious attention of the landlords; I mean the unreasonable expenses which the technicalities of lawyers' practice have imposed upon the possession or transfer of this kind of property. Free trade in land itself is the great means of improving this species of property, such as the dire force of circumstances has driven the Legislature to sanction in Ireland, and which can alone enable proprietors, by selling part of their estates or by easily raising money on them, to obtain capital wherewith to improve the remainder. To remove from land the incubus which our lawyers and an antiquated system of feudal tenures have combined to impose upon the soil, must be the constant aim of those public writers, like yourself, who desire to benefit the landed interest and the country generally.

In conclusion, I will observe that if I see on one side of a hedge four horses at length, and a boy to drive them, whilst on the other a pair, and no driver, are found more efficient—if I see a man wasting his seed corn, and having his crops foul in consequence—if I see him mowing and raking up and carting home half-rotten stubble—if I see his beasts starving in cold and wet, and his dung washed and robbed of most of its good qualities—if I see him wasteful in so many points, and only niggardly towards his labourers—I can listen to no appeals for reduction of rent from such a quarter, as I consider, that by his own act, together with the reductions which low prices bring of themselves, he may afford himself more effectual relief than he could pretend to claim from his landlord in a reduction of rent. *T. T.*

P.S. One mode of relief, which those who seek for aid to the farmer from the Legislature would do well to urge, is the repeal of the excise duty of 6*s.* a thousand on bricks, about one-fourth of their cost price! No greater impediment to proper farm buildings exists than this heavy tax on their erection.

Home Correspondence.

Landlord and Tenant.—Your remark in the leading article of the *Agricultural Gazette*, of January 5th, that "the practice of allowing land to become deteriorated towards the termination of a lease, is quite notorious" is unfortunately the naked truth. At present the landlord, to escape having his farm thrown on his hands at the expiry of a lease, very frequently engages to give a fresh one, and so put off the evil day as long as the tenant is willing to remain on the farm. That, however, is but a temporary expedient, only available where both parties are pleased with their bargain, and with each other. But whenever a tenant has made up his mind some years previously to leave his farm, then is the time for scourging crops and neglect of every kind; one thing only is considered, how to get as much as possible out of the land, and to put nothing into it. "Liberal covenants" are excellent things, because strict ones are utterly useless; a bad tenant can ruin a farm in spite of them. A lease with some sort of clause or stipulation, by which an outgoing tenant should be bound to give up his farm in as good condition as when entered on, is indispensable to make the bargain fair. I would give the tenant compensation for unexhausted manures laid upon the farm, the amount to be fixed by arbitration, but permanent improvements, as is usually the case, would be arranged by a special bargain between the parties previous to their being undertaken. That would leave the tenant nothing to complain of, and the landlord would get back his farm in fair working order. Subject to that stipulation, a lease need only be a few lines long, and contain no restrictions whatever as to cultivation. That you or some of your able correspondents would give your readers a form of lease, is the reason why I am now troubling you with these few lines. I may be excused feeling rather acutely on the subject, from having an unlucky farm which has suffered nearly 40 years from want of some protection to the landlord at the end of the lease. Its first tenant was an amateur farmer, who knew very little about the business which he had undertaken. After 20 years of mismanagement he left the farm; having been anything but a gainer himself, he left the land, as might be expected, in a melancholy condition. His successor was just the man to bring things round, and put the place in order again. He was a young man, bred to the business, with plenty of capital; in fact "one in a thousand" among tenants. He began famously. I gave him a new dwelling-house and farm-offices, charged a low rent for the farm, on account of its being out of order, and assisted him in draining, inclosing, &c. For the first 10 years everything went on admirably, and the farm was got round into perfect order, quite a pleasure to look at. By that time his work naturally grew less as matters gradually came right, and my friend, being of an adventurous disposition, took to speculating, prospered at first and then became bankrupt. The lease became the property of his creditors, who are now for the few remaining years working it "properly," while the unlucky landlord is compelled to look and see his property ruined under his very eyes, without being able to help himself. In a few years I shall get the farm back in as bad order as that in which it was 20 years ago—my first heavy outlay and my 20 years' reduction of rent all gone for nothing. *Linton.*

Cost of an Acre of Roots.—The statement of the cost of an acre of roots in a late paper attracted my attention from my having previously made an estimate of this. I send it to you, thinking it desirable that your readers should have opportunities of comparing such estimates, and offering such corrections as their experience may suggest; by which means the average cost will be established, though the particular items of cost may vary in different soils, localities, and practices. The more difficult and important problem to be resolved is, what portion of this cost ought to debited to the succeeding crops in the rotation? If any of your experienced correspondents, who may have considered that point, would favour your readers with their view of this matter, and the reasons on which it has been founded, it would be very interesting and useful to those who desire to keep accurate accounts. Your correspondent's estimate amounts to 12*l.* 10*s.*; mine, to 10*l.* 8*s.* 3*d.* The principal difference between us arises from his charging 12*s.* for two ploughings in spring, which I maintain to be unnecessary after deep ploughing and subsoiling in autumn on clean land; 2*s.* 6*d.* for Couch picking, which would not exist on such land, generally; 7*s.* per ton for carting dung beyond my estimate, which assumes dung on the farm and therefore near at hand; 18*s.* 6*d.* charged for pulling, carting, and clamping, which I get done in the field, without hauling, at 7*s.* per acre; and 10*s.* more than my estimate for rent, tithes, and taxes. I charge rather less for hoeing, as I make use of Garrett's horse-hoe, which costs something less than 9*d.* an acre, and I put interest on capital at 5*s.* 6*d.* an acre more than your correspondent.

ESTIMATE.

	£	*s.*	*d.*
Rent, tithe, and taxes	2	0	0
Interest on capital, 15*l.* per acre	0	15	0
Ploughing and subsoiling in autumn	1	5	0
Cultivator in spring	0	2	6
Double harrowing and rolling	0	4	0
20 tons manure and filling	4	0	0
Ridging	0	2	0
Women spreading dung in furrows	0	1	3
Splitting the ridges over the manure	0	2	0
Drilling and seed	0	4	6
Singling	0	3	6
Twice horse-hoeing (Garrett's)	0	1	6
Hand-hoeing in the rows	0	3	6
Pulling, topping, and storing in clamps	0	7	0
Four bushels superphosphate of lime drilled with the seed	0	16	6
	£10	8	3

I am inclined to think horse and man labour somewhat under-estimated, in respect of the application of the manures, and that a safer estimate would be 10*l.* 10*s.* *C. L.*

High Farming.—Much has been said lately by your correspondents about great crops, thin seeding, and management of land. I can give you an instance embracing all these points, which occurred, I think, about 12 or 13 years since. It was a crop of Wheat, taken from a piece of ground of very moderate quality, but had been under spare culture for garden purposes for many years. To give you an idea of the quality of the soil, I may say that the site had been coal pits in former years, and in sinking the shafts of the pits, the refuse had been laid on the surface and levelled down, which consisted of shaly clay stone, of a very poor nature. The land naturally thin and bad, in the vicinity of a large and smoky town, of which it was within a mile. The quantity of seed sown per acre was 2 pecks; the height of the straw (all standing) 6 feet, and the produce 69 bushels of Wheat per acre. The person to whom it belonged has continued the practice of alternating a Wheat crop yearly on different parts of his ground, and that is the rule so far as seeding, and crop seldom varying much in quantity per acre. This proves what may be done even with moderate land, if dry. Spade culture, no doubt, would pay every cultivator, if there is sufficient capital to carry it out. We need have no complaint of the want of employment for labourers, and I believe at a cost very nearly assimilating to horse power. You may, in most neighbourhoods, get land dug, say 10 inches deep, at 4*d.* per rod, that will be little more than 30*s.* per acre, which, after digging, requires nothing more than sowing and harrowing; and if the result is as shown, it must be remunerating. It is unnecessary that the ground should be annually dug by the spade—say once in four years; consequently a person occupying 100 acres, digging 25 acres annually, would always keep his land in first-rate management, and the extra cost would be more than covered by the increased produce of the first crop, besides the improved after crops. This is a proper system for Mr. Mechi's enterprise. Something must be done to increase the produce—rent is not the object to be considered altogether. I live in a neighbourhood where I certainly am not surprised at the result of the existing mode of working land. The idea is ridiculous to suppose that crops can be grown by such proceedings. The ground is ploughed year after year, say 4 or 6 inches deep, leaving the bottom as impervious as a high road. A time is coming when the plough must give way to a better and more effectual instrument; if not the spade, it must be something nearly assimilating in its effect. The wonder to me has long been, not that people do not get great crops, but that they get what they do by such management. I am engaged in cultivating land, but not as an agriculturist, and I know well, from 35 years' experience, that land is grateful in proportion to its management, good or bad; and with me the opinion is, that it is impossible to say what land under good cultivation will produce. I fancy its limits have not yet been attained. Subsoiling is a sort of substitute for the spade culture, but a very poor one. I say subsoil by hand, that is dig 10 inches deep, and below work the subsoil over by a fork, and leave it, keeping the top soil on the surface, and you do it effectually, and I have no hesitation in saying that the cost per acre will be less than by horse power, and a very superior piece of work when completed. Much has to be undone that is done. Old notions must give way to necessity, and many things done which have not been done. We only want enterprise and the old customs destroying, and there is yet a living to be made by cultivating land. *Verax.*

Prices.—Report says farmers are suffering through the high charges of butchers and bakers; and householders are complaining, with justice, of being obliged to pay an exorbitant price for cheap food. The unnatural state of the market is most prejudicial to the present consumers of meat, as well as to those who might indulge in the luxury if the wholesale and retail prices were more equal. The manufacturers have to look to increased consumption to remunerate them; but if they, from want of capital, are unable to supply the market regularly, the public would be at the mercy of the middlemen, who would thus control the quantity offered for sale, and injure society, particularly the lower classes. Thus it is with sheep and oxen, &c.; the farmer receives a low price for his animals compared with what he did some years ago, and has not the advantage of the manufacturer, who makes up for the cheapness of his food, by selling double the amount. The relief of the agriculturists must come through the working community, eating meat two or three times a week; which they could do at the present worth of beef and mutton, when standing on its legs; and why should they not know the taste of the same brutes, when hanging up on an iron hook in the shambles? For this simple reason, because no one will take the trouble to regulate the matter. It is to be hoped such an excuse will no longer exist, and that the correspondents of the *Agricultural Gazette* will take up the subject, which is of such vital importance, not only in a commercial point of view, but as intimately connected with the comfort and happiness of our poorer neighbours. It is strange how little suggestions are attended to at the time, which in after years are carried out at an immense loss of gold and character, when common foresight would have saved both, and added blessings to thousands. Englishmen, with all their sense, good nature, and liberality, are yet a race possessing considerable selfishness; and when once enjoying competency, individuals are averse to exertion, and trouble themselves little about anything which does not bring grist to the mill. How often do we hear men who have idle time on their hands, exclaim, "Oh, never mind; things will all come right, why should I interfere and bother myself with what does not concern me?" Persons who are living on an income which does not require them to consider how they spend every shilling, think lightly of giving a halfpenny or penny per pound for meat more than they ought to do; forgetting the bad example of such carelessness, and how many hard working men suffer through provisions being advanced beyond their real value. Such is now the case, to the discomfort of those with limited but independent means, and to the serious loss of the labourer, whether in or out of doors. It would be doing good service to the public, if the *Agricultural Gazette* would, from time to time, state the price which should be given per pound for beef, mutton, pork, bread, and cheese, leaving a fair remuneration to the retailer; beer, per pint, might be included. Rents of shops have nothing to do with these matters; if men choose to have plate glass fronts they must pay for them, not their customers. *Falcon.*

Leases.—Without entering into the motives of political parties, I maintain that if leases had been encouraged, based upon the price of corn, to fluctuate between two given points, say 5*s.* 6*d.* to 7*s.* 6*d.* per bushel for Wheat, and other grain in proportion, spreading the average over three years, in the same way as the tithe commutation, tenants might have taken leases without fear, and landlords might have granted them with increasing advantage to themselves. Fix the rent of a farm at a given price for corn, and the three years' average will prevent any violent fluctuations to disarrange the landlord's income on the tenant's profits, and you have a

true criterion of the value. Give the tenant scope for his industry and enterprise, and then, if at the end of his lease, the farm is improved and he has reaped the benefit of his exertions, clap on a per centage for the landlord, and let the tenant go on again. If this plan had been adopted 30 years ago, the agriculture of the United Kingdom would have been upon a par with the best cultivated farms, and the price of corn, during that period, would never have exceeded, upon the average, what it is at present; then what becomes of protection? To this complexion it must come at last; or nearly all of us will be ruined, and drag our landlords into the vortex after us. I have been led into this digression by the query of "E. O.," who asks, What does it require to cultivate an average farm of 50 acres in the present day? Supposing "E. O.," as an amateur farmer, to be A 1, I just make a hasty estimate of what it would take to do the thing well, and not extravagantly, which upon an average grazing farm in the Eastern Counties, of about 44 acres arable and 6 pasture, would be within a few pounds.

If "E. O." make the 17*l.* 3*s.* up 50*l.* it will buy a little artificial manure and cake, &c., and another 50*l.* just to keep the cart on the wheels during the Christmas tide, it would help him on wonderfully. "E. O." will perceive he might double his occupation, or even up to 120 acres for about 380*l.* more, and be in a much better position. *Peter Ploughman.*

Dry Process of Preparing Flax.—In the year 1810, a new method of dressing Flax was patented, by which the woody matter was separated from the fibre without steeping it, by means of mechanical action, and then the Flax was bleached by simply washing it in warm water. It would appear that the colouring matter is not chemically combined with the fibrous matter, while the plant is vegetating, or after it is pulled, but that the chemical combination takes place while the plant is steeped in water. The object of this steeping is to induce a fermentation, which loosens and destroys a cement which bound the fibres of Flax to each other and to the wood. The fermentation weakens considerably the strength of the Flax fibres, and even destroys many of them. This dry preparation, therefore, if it be practicable on a large scale, would be a prodigious improvement. It would render the Flax fibres much stronger, it would increase their quantity, and it would save the expense of the materials employed in bleaching the linen. It has been stated that the dry process has uniformly failed of success, when tried in Ireland. If this account be true, it is extremely difficult to explain it. About the time when the patent was taken out, the process was performed by workmen, under the direction of the patentee, at Old Bow, near London, with the most complete success; not merely upon handfuls of Flax, but upon whole fields of it. Indeed, the whole is so extremely simple, that it is difficult to explain how it should fail, if properly conducted. It is therefore highly probable, that the prejudices of the Irish, with which it would have had to contend at that day, were too powerful for it; but that as soon as it shall meet with fair play, it will be found just as practicable, and certainly much cheaper and better, than the methods at present in use. It is during the steep, then, that Flax acquires its permanent dark colour; and four processes in bleaching are requisite to restore it to its original white colour, or to separate the colouring matter, which is chemically combined with the fibres of the Flax. *T. S.*

The Fall of Rain here for the year 1849 is as follows:

January	Inches	1.56	
February		1.67	
March		0.24	
April		1.76	
May		5.03	
June		0.33	
July		2.75	
August		0.62	
September		2.77	
October	Inches	2.12	
November		1.69	
December		2.58	
		23.12	
In 1847		17.60	
In 1848		30.00	

The fall of rain in May last, 5.03 inches, is the largest I have to record in any month during the last three years. I have had under my notice a large field of observation as to drainage in the various soils of this district, and I have observed on many occasions the insufficiency of 1 to 1¼-inch pipes to receive and discharge the water from the soil; and indeed 2-inch pipes are not always adequate to this purpose, if the drain be an extensive one. If the parallel drains of a field consisting of 8 to 10 acres are collected into a single main, that should be constructed with double 2½ or 3-inch tiles, which appears to me to be far better than pipes, although of equal capacity; and when practicable, let all drains be open at both ends. In spring draining, it is essential to get under rather than into the water. *Henry Dixon, Dorwards Hall, Witham, January 7.*

* The threshing machine horse-works will do for this.

Thick and Thin Sowing.—As a proof of what may be done in thick and thin sowing, the following is a case which, so far as I have heard, is exceedingly rare, if not altogether unparalleled. The carpenter, who resides in the same village with myself, has about an acre of ground which he cultivates himself; rather more than half of this he sows every year with Wheat, at the rate of 1¼ peck per acre; the rows are 8 inches apart, and the plants 5 inches in the rows. The produce of this at harvest is from 12 to 16 coombs per acre, or 40 to 60 bushels. After the Wheat crop is off, he carries out what appears to me to be a very good system, and one which I heartily wish could be followed on all farms as might appear practicable, 1st, in drills 30 inches apart, he plants Beans; 2dly, between the rows of Beans, Beet; and 3dly, in the furrows, Potatoes. As the land in this part of the country is ploughed in narrow stitches, 9 feet in width, there are several furrows in an acre; consequently, he is enabled to grow a sufficient quantity of Potatoes to supply his family, consisting of himself, his wife, and five or six children, for the whole year. Although Mr. Mechi has gone a great length in thin sowing, I think he will allow that he is outdone in this case; should he be able to reduce his quantum of seed to this proportion, no doubt he will; and I am of opinion, he will only be doing what is perfectly right, and at the same time in strict accordance with the principles of good economical farming. Would that the day were already arrived when tenants might carry out this system of farming, and thus introduce additional crops into the 4-course system. Our country would then be in a more prosperous and flourishing condition than it has been of late years; and if landlords would come down into the country, and give employment to our labouring classes, who are willing to work, though now, in many cases, forced to be idle, we should then again see some signs of prosperity. They talk of industry whilst our poor are starving in the mean time for want of actual work. There is an almost endless quantity of profitable labour that might be done in this country in the way of drainage alone. An equally important subject for the consideration of landlords is, the improvement of farm-buildings, so as to provide good feeding-sheds, liquid manure tanks, &c. Tenant farmers are told they ought to do all this, and it would be well if they could and would; but let me ask, is it fair for the tenant to do it all, and then for the landlord to take his share of the benefit? I think not. Let our landed proprietors come forward and assist the tenantry, by first reducing the rent to the average price of corn, and then by providing a fair portion of the necessary means for improving their own property and increasing their own wealth. I am not one who would excuse the British farmers for not doing more than they have done hitherto, far from it; they are I consider far behind their duty, and stand very much in their own light; but let us, both landlord and tenant, pull together, to do each other good; let Christian charity prevail amongst us, and, with the blessing of a merciful Providence, we may hope to find ourselves better off than the gloom of our present prospect leads us to anticipate. *J. R.*

Agricultural Progress.—Rich Mr. Mechi, good Mr. Mechi, do not as yet lose all patience with us country clodhoppers; indeed, you must not, as you have undertaken to teach us. But, above all, do not think that we all cavil and sneer at your "improved husbandry," and triumph at your supposed failures. I, for one, may safely say that I have the greatest respect for you as an experimental farmer, and wish with all my heart that you may realise "cent. per cent." before you will have been at Tiptree-hall another seven years. I can well appreciate the merits of well-tilled ground, well-kept fences, good farm-buildings, and all the belongings of high farming. But, indeed, all farming, by reason of present prices, seems under a cloud and we all naturally want to know whether even high farming itself will pay, if things go on as they now are. Of no one can the question be more fairly asked than of Mr. Mechi, for he is a real high farmer, and, moreover, thoroughly acquainted with accounts. I would ask purely for information; it is important to me, for I am a shopkeeper in a market-town, the centre of a large agricultural district, and upon the prosperity of agriculture I conceive my profits depend. Let us put a case. I am the owner of Tiptree; you, Mr. Mechi, are my tenant (a strong case enough you will say). By our united efforts we have reclaimed the farm, and put it into the first-rate condition which it now presents. You have two years since taken a lease from me for 19 years, with "liberal covenants." Rent, say on 200 acres, 300*l.* You have probably 2000*l.* capital at least invested upon it, upon which you would want 10 per cent. What expectation have you now, with the present average of prices, of making a decent profit for yourself at the year's end? Could you, as tenant farmer, make a living out of it? Could you, even if I gave up 100*l.* a year rent? If you think you could, pray give us a short Dr. and Cr. statement of the how; for this is just what 19 people out of 20 tell me is impossible, and I wish to see proof, or, at all events, sufficient presumption that it is possible. If you do not choose to do any of these things, pray excuse the presumption of *Sagitta.*

Manure.—In the *Agricultural Gazette* of the 29th of December, a correspondent signing "P.," writes fully and forcibly on the necessity of farmers applying themselves to meet the altered circumstances in which they are now placed by competition, and trusting more to individual exertion than legislative interference. I agree with the writer on the many points advanced where economy and application can be brought to bear in increasing production, and I am desirous to avail myself of every opportunity of doing so. In the economy of manures much may yet be done, and I shall feel much obliged if "P." will inform me how I ought to make and preserve my farm-yard manure. My buildings are spouted, and the bulk of my manure is made under sheds, receiving no moisture but urine, and this, with cattle droppings, including the dung of pigs and horses, is mixed and well incorporated for the growth of Turnips in June. After the cattle leave the yards in the spring, the manure in the yards and sheds is turned over and kept dry under the sheds, till required for the Turnip crop. In the article above referred to, your correspondent complains of the "system of mixing together straw and cattle droppings, and leaving them to ferment exposed to air and water." Now I wish to know how manure should be made, in ordinary farm-yards, without straw? Can "P." make horses lie on boards; or what sort of farmsteads must be constructed, were all the young stock reared on the farm lodged on wooden gratings? Assuredly stock of any kind cannot be very comfortable when they have no bed but boards, though it is impossible to say how they might like a hard bed when used to it. I shall be obliged if your correspondent would be more explicit on this most important subject. *J. J. Rowley, Rowthorne.*

Cultivation of Hemp.—Hemp has been cultivated in the counties of Lincoln and Suffolk from time immemorial, but chiefly for the purpose of local manufacture; and, although it has been very little attended to in Ireland, some experiments made this year by the Royal Flax Improvement Society to grow this plant in the south, turned out very well. In county Limerick, some stalks attained the height of 7 feet. Hemp may be cultivated on the western coast of Ireland, where it would be of great use, as affording material for the nets, lines, and cordage of the fishermen, who are generally destitute of these necessary articles. It might be grown by themselves, and scutched, spun, and twisted, or netted, by their wives and daughters. The quantity of this article imported, annually, into Great Britain and Ireland, is about 45,000 tons, valued at 1,600,000*l.* About 1 million sterling of this comes from Russia. In entering upon the cultivation of Hemp, the first thing to be attended to is the selection of proper soil; the best suited for Hemp is a deep black vegetable mould, with a low situation, and inclined to moisture; it does well on a rich clayey loam, and old meadow land is well adapted for it. The mode of preparation, and the place in the rotation, are the same as for Flax. The proper season for sowing is April, as soon as there is no danger of the young plants receiving injury from the frosts. The seed is sown broadcast, from 2 to 3 bushels to the statute acre, according to the quality of the land. The quality of the seed must be fresh, heavy, and bright in colour. Hemp is one of the few plants employed in the agriculture of these countries, in which the male and female flowers are in different plants, which circumstance has some influence in its management, so far as taking it off the ground is concerned. When the crop is grown entirely for the fibre, it is pulled when in flower, and no distinction made between the male and female plants. But, as is most commonly the case when it is cultivated with a view to both fibre and seed, the usual practice is to pull the male plants, the stalks of which are easily known by their yellowish hue and faded flowers as soon as the setting of the seed in the females shows that their presence is no longer necessary. The reason for thus pulling the male so long before the female is, that the latter requires four or five weeks to ripen the seeds. The operation of pulling the females commences when the seed is ripe, which is known by the brownish hue of the capsules and the fading of the leaves. The after treatment, such as steeping, &c., is the same as Flax. *T. S.*

Societies.

Highland and Agricultural, *Dec.* 12: *Discussion upon the Storing of Turnips and other Roots.*

Mr. Scott, of Craiglochart, said — First, with regard to Turnips, I believe it is generally admitted that such of the white or yellow varieties as require to be kept over winter should be protected from the weather, and even Swedes will, in the majority of seasons, derive benefit from protection; for not only are Turnips liable to be injured by frost, but after the spring growth takes place, much of the nutritive matter is lost by being converted into woody fibre. Where it is necessary that the Turnips remain on the ground till spring, much benefit will be derived by having the bulbs covered with earth, which can be done on light land by passing a double boarded plough between the rows; but where the land is stiff, a common plough will answer the purpose better. Where Turnips are to be removed from the ground, it will be better that they be lifted and stored before any severe frost sets in. In cases when they cannot be directly carted off, they may be stored in quantities of one or two cart-loads, in the form of a Potato pit, and slightly covered with earth; but I believe the better way is to have the Turnips carted off to a convenient situation, and put up in ridges of about 6 feet in width, and about 4 feet in height, to be covered with straw, firmly tied down with straw ropes, the ends of which are easily fastened by putting a spade-

ful of earth on the end of each. Turnips stored in this way may be kept fresh till the end of May; but when it is wished to keep them so long, it may be necessary to turn them over in the month of April, to check the growth, covering them as before. In removing the stems and roots, care should be taken not to injure the bulbs; and they ought never to be stored in a frozen state, otherwise they will be liable to spoil; however, if not convenient to cart them off the field immediately on being pulled, by placing them in rows, on the field, of four or five drills, and covering them with the stems, they will be protected from slight frosts, and may be carted off the first dry or frosty day. Second, with regard to Potatoes; it is almost unnecessary to say that these roots must be protected from the influence of the weather, that they be kept dry, cool, and free from frost. At one time it was no uncommon practice to store Potatoes in large houses to the depth of 6 or 7 feet, or in large pits 6 or 7 feet in width; all that was considered necessary, if they were lifted dry, being to keep them free from frost; but of late years, such a proceeding would be a most hazardous experiment. When Potatoes are lifted from the ground, however dry they may be, and put together in quantities, they throw off a considerable quantity of moisture, or, as it is technically called, sweating takes place, which is repeated to a less or greater extent every time they are moved or turned over; and of late years, since the appearance of the Potato disease, even with sound Potatoes this appears to take place to a greater extent than formerly, and if means be not taken to allow the moisture thus generated to escape, there is great risk of heating or fermentation taking place, by which the whole mass may be destroyed. Potatoes for storing should be moderately ripe, and lifted dry, and probably the best mode of keeping them is to put them in a cool well-ventilated house, to a depth not exceeding 2½ feet; but care must be taken to exclude any strong light, otherwise those on the surface will turn green and acquire a bitter taste; but where Potatoes are grown to any extent, such an amount of accommodation as would be required for this purpose is seldom to be obtained, and, therefore, recourse must be had to pitting. The pits should not exceed 4 feet in width, raised to a point in the centre of about 3½ feet in height; and with a view to facilitate the drying of the Potatoes, and carrying off the moisture that is generated, lines of drain tiles or pipes may be put along the centre of the pits, and at short intervals carried up to the top, and also cross lines opening to the outside. The Potatoes are then to be covered with straw or turf, above which a moderate quantity of earth. Of course, on the approach of frost, the openings of the tiles or pipes must be carefully closed; and there is no doubt this plan will, to a certain extent, have a beneficial effect; but where it can be done with safety, a better mode is to cover the pits with straw only, until the Potatoes have become quite dry; and if the straw be put on to a depth of 9 or 10 inches, in the same manner as in thatching a stack, and firmly roped down, they will dry better, and the straw thus put on will resist a considerable amount of bad weather, but on the approach of severe frost it may be necessary to put on additional covering, which may be of stable litter, or they may be covered up with a light coat of earth; in this way Potatoes will keep well although there be a good many diseased ones amongst them, but if these are to a considerable extent, it may be prudent to separate them before storing.—Mr. MACLAGAN, jun., of Pumpherston, said: There are three things to be guarded against in storing the Potato, viz., dampness, frost, and heating or fermentation. In as far as I have been led to form an opinion, I think this object can best be accomplished by storing in pits. When Potatoes are stored in a house, there is generally too great a quantity of them put together, even though they are not heaped too high, and this is apt to induce fermentation, and produce rapid decay. From the extensive use of the Potato, and its acknowledged importance as food for man and beast, public attention has been more than ordinarily directed to its proper preservation, and various methods have been recommended for this purpose. I have found the common triangular pit to be as good, with a few simple precautions for preserving the Potato, as any method recommended. It should not be wider than 4 or 5 feet at the base, and as high as the Potatoes will lie when thrown up by the hand; and the ground about the pit should be well drained of all superfluous water. When the Potatoes are pitted they should be well picked, so that not a bad one should be put into the pit, and well drawn straw should then be put on them, covered with earth in the usual way. The Potatoes are very apt to heat when they are laid in a body, even though that should not be large, and a moisture exudes from them, or they are said to sweat. Now, precautions should be taken to remove the dampness, that if sweating should occur it may be attended with no worse consequences. This may be best done either by evaporation or by absorption. It is done by evaporation when the pits are ventilated by opening a connection between the interior of the pit and the external atmosphere, which is most conveniently effected by placing ventilators of straw on the top of the pits, or causing a circulation of air through the Potatoes, by means of tiles placed across the pit at different places. Those who have tried this plan have recommended it as most efficient; but the objection to it is that, if not properly attended to during frost, the Potatoes are very apt to get frosted. Or the dampness may be removed by absorption, by throwing any absorbing material, such as sawdust, or simply dry earth, among the Potatoes, during the process of pitting; and these substances, by absorbing the moisture exuded by the Potato, keep it always dry, and thus render it more certain of keeping. I know an instance where, before the present failure of the Potatoes, a farmer made a practice of throwing in some soil among the Potatoes as they were pitted, and his, in one season particularly, were the only Potatoes preserved sound in the pits in that neighbourhood, though other farmers had the same variety, but neglected this precaution, thinking the Potato could not be stored too clean. Now, as regards the Turnip. If Turnips are placed in a large heap, they soon give symptoms of fermentation and decay at the bottom, and in the middle of the heap; if, on the other hand, they are exposed singly to a withering draught, the feeding substance is soon evaporated, and nothing is left but the skeleton of the Turnip—its woody fibre. These are two extremes against which we must guard. And here, again, our object is best gained by storing in pits rather than in a house. In storing Turnips the ground on which they are to be put should be freed of all stagnant water, and the Turnips should first be thrown down in a body from 3 to 4 feet high, with a flat top, and straw thrown over them to preserve them from the frost; the rain falling from above, and passing through the heap, does no harm in my opinion, but rather good, in keeping the Turnip fresh. The great difficulty I have felt in getting Turnips stored, is the removing of them from the field, which is generally so wet, that it is not only oppressive to my horses to take them off, but injurious to the field for the next crop; and, besides, when the cartage of such a bulky material is to take place, a due regard ought to be had to the general economy of the labour on the farm. We are better ploughing our stubble land than injuring our Turnip field, and cutting up our roads by such great cartage. I allude only to when the weather is wet, which in nine seasons out of ten is the case at the very time we are most anxious to store our Turnips. It is therefore necessary that we should take some preparatory steps to preserve them in the field from the frost till we are enabled to get them home. Various methods have been recommended for this, such as ploughing in, &c.; but the objection I have to many of these is, that I cannot cart them home fresh at the very time I desire, viz., during frost. The plan I have adopted latterly is to shaw them all, and then throw them into heaps, 6 yards apart, in the field, and cover them with the shaws, and then when a frosty morning comes sufficient to bear the carts, the whole force is put on, and the Turnips are got home as fresh as the day they are pulled. This additional labour costs about 2*s.* 6*d.* per Scotch acre, but certainly when we consider every advantage attending it, it is well spent money. The poaching of the ground and the cutting up the roads are avoided, while it is done when the horses can be best spared from the plough.—Mr. BLACK, Dalkeith, said: The system of storing Turnips which I have adopted for several years past, and with satisfactory results, is this. All the Turnips I expect to be consumed previous to the 1st of February are topped and tailed, and put up in heaps of 6 feet in width at the base, and 3½ feet in height; this size of heap I would recommend as most convenient for covering—they are covered with loose straw next to the Turnips, and then with a coat of well dried thatch, similar to that used on corn and hay stacks; the ropes are put on horizontally, and fastened with pegs stuck into the heap, having the ropes twisted once round them. This finishes the storing for winter's use. Those intended for spring feeding are bulked up with a double-moulded plough, similar to Potatoes, men following the plough with spades to cover any high standing Turnips that may be left uncovered by the plough; they are left in this state till wanted, and are brought once more into sight by the application of a pair of heavy harrows crossing the drills; those that remain till seed-time approaches should be stored in a similar way to those intended for winter's use, but less care is necessary; all that is then needed is to protect them from the effects of droughty weather. This method of storing Turnips not only protects them from the effects of frost, but also from the ravages of hares, rooks, and rabbits. I may mention that I much admired the plan of storing Potatoes followed by Mr. G. Watson, Libberton Mains, this season. He covered them with a coat of well-drawn straw and ropes, allowed them to remain in this state till the fermentation which usually takes place had abated, and then covered them with earth when the straw had become completely dry, thus obviating the injurious effects that invariably follow from covering them close up while the process of fermentation is going on, particularly to those intended for seed. Mr. Watson tells me that the Potatoes stored in this manner have kept better than any other method of storing he has tried this season.—Mr. MELVIN, of Bonnington, Ratho, said: I believe it was Professor Johnston that, in one of his addresses to farmers, told us that when we were at a loss to know what was agricultural truth, we ought at once to ask a question of Nature, meaning by that to perform an experiment for ourselves, and read there the answer. Now, on the subject of the storing of roots, it appears to me that however much general knowledge there may be regarding the subject—and those gentlemen who have preceded me in this discussion have most thoroughly shown their possession of it—in regard to some minor points, a little exact knowledge would be of use. I do not mean by this, or now to enter upon the propriety of taking up Turnips before winter, as I have nothing to offer on that head, but to acquiesce in the views previously rendered, although I must confess it would be very desirable to have had some accurate series of experiments prepared in different localities to have learned the actual gain therefrom. But what I now propose to submit to the meeting is the actual results which follow the adoption of different modes of storing Turnips. The first experiment undertaken was to ascertain if any, or what amount, of loss of weight arose from having Turnips topped and rooted in the usual way, and left exposed in the fields for a period of time. A quantity were taken up on the 19th October last, cleaned, weighed, and heaped up, allowed to remain exposed to wind and weather until yesterday, when they were again re-weighed, and the loss per ton amounted to 1 cwt. 91 lbs., after having lain 52 days. This fact speaks volumes against the pulling, and allowing to lie in the fields, of Turnips, for any length of time. It seemed a matter of some importance to test accurately the loss of weight that Turnips suffered from being stored in the usual way, in rather small heaps, and covered with straw in an open exposed place. A portion so weighed on the 19th of October, and re-weighed on the 11th of December, showed a loss of 1 cwt. 60 lbs. in the ton; rather an unlooked-for fact, to me at least, as I was of the belief that the straw kept out a portion of the air from blowing so freely through them. The next subject of inquiry was, whether or not it is possible so to preserve Turnips, after being taken up, that no loss of weight shall result. A quantity, therefore, was sunk into the ground, the bottom of the hole laid with straw, and the bulbs all closely covered over with this also, and one foot depth of earth laid above all. The rain that fell was also shaded off. When this portion was re-weighed, it was found not to have lost any weight whatever. It would appear that, by hermetically sealing them up, as the chemists would say, at this period of the year, they can be preserved without loss. After the able statements we have heard from those so well qualified to lead opinion on this subject, it is not for me to presume to say in what manner the Turnip heap should be spread, but I would merely point to what the experiments above detailed would lead, and it is every one's duty to satisfy themselves on this head, which they can easily and cheaply do, as their experience may differ from mine. And first of all, it appears obvious that Turnips ought to be received from the field as soon as possible after being pulled; and next, that they be laid into as large masses as possible; for in this way they are much easier protected from external influence. But here again another subject must be guarded against, and that is the danger arising from internal decomposition. There are few crops of Turnips but contain many rotten ones, and even many bulbs, apparently sound when taken up and put into the store, soon manifest symptoms of decay; and as substances when in this state evolve heat, the temperature of the mass rises; for we are all aware that the low temperature is the cause of the bulbs being checked from growing during winter. So soon, therefore, as the heat of the heap increases, a fresh growth commences; this very growth again produces more heat, as we can easily prove from the rise in the temperature that takes place when Barley is malted. The store is now in a changed state; the vital powers of the bulbs being excited, they have no rootlets to push out into the moist earth, wherefrom to draw nourishment, but the stores contained within the bulb must be resorted to, and immediate deterioration takes place; should there be any slightly unsound, the warmth produces decomposition among these, and the decaying virus spreads. We therefore see that, between the two extremes, we must choose that free of heat, which, while preventing the external influence of frost, rain, sunshine, and drought from injuriously affecting its contents, and permitting the free egress of internal heat, is the best. The free passage of the air through the mass must be checked, while either the covering or quantity put together must not be too great. Rows of heaps, about 6 feet wide and 4 feet high, ranged parallel to each other, and the whole surface levelled over with straw so soon as the frost sets in, is the form that appears to combine most advantages; while the straw from thatching of stacks, or any short damp portions that are found about all yards, are much superior as a covering to new-threshed dry straw. There is another subject deserving some consideration in reference to this matter, and that is the manner in which the operation of topping and tailing of the bulb ought to be performed. We sometimes see broad slips from the top of the bulb slipped off along with the shaw, and at other times the root is taken off too far up. Since the chemical analysis of the shaw showed that there is nearly as much solid matter in it as in the bulb, it would naturally be expected that more attention should be paid it for the purpose of being consumed by stock, but this does not seem to be the case; and after all, perhaps, the best application of it is to plough it in green; still there is a portion of the thick end of the leaves that may be left attached to the bulb, and cattle do not seem to reject it as they do the rest of the blade. Now, it occurred to me that it is possible that when the leaves and root are cut off, as they are in the usual method, close into the bulb, there may be an emission of more of the juice than when part of the leaves and root is left. To ascertain this point, other three experiments were tried: first, then, a quantity had 2 inches of shaw, and the main root left at the bulb, weighed and exposed for 52 days, and before being reweighed, were found to have lost 2 cwt. 25 lbs. per ton. Another portion was weighed, topped, and tailed as the preceding, covered with straw in the usual way, and reweighed again yesterday, and was found to have lost 2 cwt. per ton. A third portion, similar to the last, was closely covered up beneath a foot of soil, and kept from the ingress of water, and, on again trying their weight, were found to have lost 57 lbs. a ton—corresponding to the loss resulting from the 2 inches of leaf that were left on them having fallen off in the handling of them a second time, it having much rotted; and otherwise, these three other trials just corroborate the former ones.—Mr. M'LEAN, Braidwood, said: I trust I may be permitted to state some of the modes practised in the higher districts, in which I reside, and where greater care is requisite to preserve them from the nipping frosts and vermin by which they are liable to be assailed when lifting them in November, and storing them in pits for winter use. I have found earth alone preferable to straw, not being so apt to take in rain. When storing, great care should be taken not to break the Turnip by the shawing knife, but left in the same state as those now upon the table, neatly topped but not tailed, as those cut are more likely to be decayed. Bulking up by the plough, as mentioned by Mr. Black, is an excellent mode of preserving them, besides benefiting the land by stirring up the subsoil; I have left portions undone, and have found the following crop better where bulked up. A plan very generally adopted is to run up a double moulded plough through every third or fourth drill, according to the weight of the crop, by careful shawing, putting them neatly into the opened furrow, and with the common plough once round completely covers them. This mode is found beneficial in sheep farms, as they may be allowed to pasture near them with safety. When wanted, by running up the double moulded plough, you scatter them to both sides, and get them easily removed, and I have invariably found them fresher than when stored in pits.—Mr. FINNIE, Swanston, said: I will confine myself to one or two remarks on the storing of Turnips, which well deserves more of our attention. Wherever I have been in either England or Scotland, there appears one uniform practice of storing Turnips, viz., throwing them together in large heaps, and in general regardless of their exposure to wind and weather—the quantity put into one mass—and whether, as the season advances, the stock actually get them in the state most likely to afford the greatest amount of nourishment. I have been most solicitous to obtain better information on that part of my practice, and the remarks, therefore, I am about to make, are not so much with a view of holding out a system for adoption, as to induce others to point out its defects. I believe every farmer will admit that it is most undesirable to go to the fields during the winter months for a supply of Turnips for either rearing or feeding cattle. Two evils result from it—1st, the poaching of the land; and, 2dly, the injury done to the stock from the quantity of clay and earth which is unavoidably brought home with them. In another respect, I think I shall be supported when I state that Turnips raised before frost sets in are much more nutritive, and, to use a homely expression, stand much more eating, than those left exposed to the winter blasts; and that, in short, hardly a season passes without many being entirely destroyed by frost and other causes. My object, therefore, has been to endeavour to adopt some systematic plan by which the cattle may have their supply of Turnips during the winter months in a way most likely to forward the fattening process. Towards the end of October, generally speaking, the Turnip crop may be said to cease growing for the season. I therefore calculate the quantity required for the months of November and December, root and stem them in the field, and drive them home to some convenient spot about the steading, not laying too many together, and give them a covering of straw. Those needed for January I store in pits similar in shape to the Potato, but restricting the quantity to 15 cwt. per lineal yard. What is intended for February and the two first weeks of March, I cut off the tops, but leave the roots, as I find they keep that length of time in a much fresher state than when the roots are taken off; but the quantity per lineal yard is reduced to 12 cwt. Those, again, intended for spring feed, and until the Grass is ready, are left untouched in the field, beyond doing what Mr. Black practises—running a double moulder plough between the drills, covering them as completely as possible with earth, and there they remain until the land must be cleared for the sowing of the Barley, when they are stored in pits of similar size as those already referred to. I should have stated that I first gave the pits a thin sprinkling of straw, over which the slightest covering of earth is thrown. I would prefer the earth alone; but in going to the pits in frosty weather, the straw prevents the earth sticking to the Turnips, and admits of them being taken to the cattle in a much cleaner state.—Mr. DICKSON, Saughton Mains, alluded to a different mode of storing Turnips, particularly Swedish. They are removed from the fields where grown, and taken to a field convenient to the farm steading, where they are placed, the leaves and roots being placed closely together. In this way one acre will hold the produce of from 10 to 15 acres. Mr. Melvin's experiments brought out a great deficiency in weight by storing. It would be desirable to learn from Professor Gregory or Dr. Anderson if this was attended with any serious loss to their feeding properties.—Professor GREGORY said, the mere loss of weight by no means proved an equal deterioration in the feeding qualities of the Turnip. It must first be determined whether the whole or how much of that loss is caused by evaporation, or exudation of the juices of the plant. If the latter, the loss would be great.—Mr. THOMSON, Peffermill, said, Turnips, like other plants, must have a ripe season, when he thought they should be raised and preserved as dry as possible. The Turnip, he thought, was ripe in November, and by storing them then he had for six or seven years found them to keep till May or June. He had uniformly found when Turnips were drawn from the field in March, that it was impossible to keep them without their giving way. They must be well stored previously to frost. Cutting close to the roots should be carefully guarded against. He had also another remark to make—he had often observed a quantity of stuff like treacle given out by the Turnips, and he was anxious to know how far this affected their feeding qualities.—Professor GREGORY remarked, that the fact mentioned by Mr. Thomson of the appearance of a syrupy liquid among the Turnips would seem to show that exudation of the juices actually does sometimes occur. It was obvious that the exudation of that liquid must have been highly injurious to the feeding power of the roots; and it remained to be seen under what circumstances that exudation took place, as well as how it was to be avoided.—Dr. ANDERSON said that, of course, if the diminution of weight was due to exudation, it would involve a serious loss, and it was not easy to ascertain whether or not this was the case. In the course of some experiments, however, in which he was then engaged, he had been led to observe, that exudation took place very slowly in the Turnip, and he was inclined to attribute the main loss to evaporation. In so far as he could venture to give an opinion, which, of course, must be only a theoretical one, on the subject of the preservation of Turnips, he was inclined to think that storing them was preferable to keeping them in the ground after they had reached maturity, because any further growth must be attended with a diminution of their value; when in the ground they are in the condition to take advantage of any warm day, and to deteriorate by the consequent growth. He might be permitted to observe, that he thought there was a want of definite information

regarding the alleged diminution of feeding value consequent upon the prolonged preservation of the Turnip. He was then engaged in a series of experiments on the feeding value of that root, which he hoped on some future occasion to communicate to the Society; and he remarked that, if Mr. Finnie could be induced to store some Turnips in different ways, their analysis would in all probability throw some light on the subject.

Miscellaneous.

Sainfoin.—I take it for granted that the system of sowing the whole of the Barley shift with Clover is no longer practised generally, from a conviction that half the shift, sown every eight years, will produce at least three-fourths as much food as can upon an average be produced from the whole of the shift sown every fourth year. When this plan is adopted, it will leave half the shift to be sown with some other crop. Here it is that I would commence operations: upon a part of this—say one-sixth of the entire shift—which I will suppose to be cropped with Peas, and which, upon a farm of 100 acres, in each season will amount to about 17 acres; to this quantity, therefore, I should direct my attention so soon as the Peas were harvested, and, by a little extra labour then, and during the period that elapsed before Michaelmas, I should take care to render the process of summer fallowing after the ensuing Wheat crop perfectly unnecessary. This being done, I should, in the Wheat crop, whether sown broadcast or in rows, deposit the seed with a drill in the spring. In that case, the land will present you with a crop of Sainfoin in place of the Turnip crop. This may be mown early in June for hay, and again in August for seed, and it will then produce a fine eddish in October. This I should continue in plant a second year, when it would displace the Barley crop, and again in the third year displacing the Clover layer. I then propose that it should be taken up for Wheat with the rest of the shift, when, in my opinion, it will with the same treatment produce the best crop the shift will afford. I am quite aware that the plant of Sainfoin will not be exhausted; but, upon a Sainfoin layer of four or five years' standing, the wireworm sometimes makes sad ravages in the ensuing Wheat crop, and even in the Turnips and Barley that follow: when the plant has been taken up in full vigour, say at the end of three years, I have never known these disasters occur. *Mr. Hine, in the Journal ofthe Royal Agricultural Society of England.*

Worcester Agricultural Society.—The premium offered by Mr. Henry Webb, for the best crop of Swede Turnips, grown with guano only, has just been awarded to Mr. Oldaker, of Grimley. The weight of the crops per acre in the competing fields was as follows:

	Tons.	cwt.	qrs.	lbs.
Thomas Oldaker, Esq.	35	2	3	12
T. G. Curtler, Esq.	23	3	2	8
Hon. and Rev. W. C. Talbot	23	4	2	16

Ireland.—English and Scotch farmers are settling in Mayo. A Scotch farmer has taken Gortnor Abbey, one mile from Crossmolina, with 167 acres of good land, fenced and drained, for 1*l.* 5*s.* per acre. At Poula Coppul, near Belmullet, an Englishman has taken a farm of 600 acres—100 of them good arable land, at a rent of 75*l.* per annum. At Ballyglass, an English family has taken 800 acres, of which 200 are fit for tillage, at 100*l.* a year. Within four miles of Newport, another "stranger" has taken a farm of 100 acres under Sir Richard O'Donnel. *Waterford Mail.*

Improvement of Welsh Agriculture.—The best way for an enterprising landlord, in the Welsh parts, to disseminate improved and scientific agriculture among his dependent farmers would be, to encourage the education of the most intelligent of his tenants' sons—to place them in the Royal Agricultural College—to permit him to view various good farming in England and Scotland, and then take him as his farm-bailiff. His practical and theoretical knowledge could be easily explained to the unlearned and unskilful tenantry, and might convince those who, from real ignorance, are often considered obstinate. *Mr. Read, in the Journal of the Royal Agricultural Society of England.*

Calendar of Operations.

JANUARY.

NORTH LINCOLNSHIRE WOLD FARM, *Jan.* 10.—Our horses and men have been employed during the last week in threshing Wheat and Barley with a 6-horse power machine, and in dressing and taking it to market. The Wheat is sold at 40*s.* per qr., weighing 18 stone per sack, gross, and the Barley at 23*s.* 6*d.* per qr., weighing 16 stone per sack, gross. We deliver the Wheat at a railway station, distant about 5 miles, and the Barley at Brigg, distant 13 miles from our farmstead; prices far from remunerating. We have been unable to stir a plough on the land, on account of the frost, since the 27th ult. Turnips are going up very swiftly, and although plentiful and cheap a month ago, we should not be surprised at their being sold at 5*l.* per acre to eat off on the land before the spring; an excellent crop was sold, however, in our neighbourhood at 25*s.* per acre, to be eaten on the land, before the storm set in. Our sheep are remarkably healthy on Turnips, and are doing well. The Wheat was looking beautifully before the frost commenced, but there are many hundreds of acres in our neighbourhood not yet up. *H. G. S.*

SOUTH HAMPSHIRE FARM, *Jan.* 12.—The weather since our last report has been of a varied character, but for the most part frosty with great absence of rain; and although for several weeks but little ploughing has been done, yet it is not important, for we should say a season was scarcely ever known when the field labour of the farm was in a more forward state than at present. Our horses have been employed during the past fortnight carting chalk on to newly grubbed ground, carting dung on to land where the Turnips have been fed off recently, in readiness to be sown with Wheat as soon as the frost breaks up; they have also been at work with the threshing-machine, threshing Wheat, Barley, Beans, Peas, and Oats, for which kind of work the frosty air has been highly favourable, for we find the corn we have had removed, threshed, and winnowed, has been much improved in condition by it. The few days of open weather which we had last week enabled us to finish ploughing all our fallow land intended for Turnips and other green crops. Our odd horses have been kept constantly employed by carting hay and Turnips for the ewes and lambs, carting hurdles for the removal of sheep, carting leaves from the pasture land, carting manure from the cattle pens, pigsties, &c., and also carting Carrots from the store heaps to the field for the lambs; and as we use them fresh from the heaps, the lambs do much better on them than they would with frozen Swedes. Our labourers have been engaged attending threshing-machine, winnowing corn, taking in ricks, hedging, banking, ditching, filling chalk, filling dung, filling carts with earth, where we are now removing old banks and carting into the hollow parts of our pasture land; thus two purposes are answered—the throwing open of the land and improving the surface of the grazing land; for which work the frost is well adapted, preventing the cart-wheels from cutting through the sward. The women are employed preparing and stacking Swedes and Turnips in readiness to be cut for the sheep; where our other work does not interfere, we prefer having them stacked and prepared by the acre, the price being 10*s.*, where we have a full crop. Our shepherds are now very busy, for although our horned ewes finished lambing, and all are forward in condition, and kept at full head on Turnips, hay, &c., yet our southdown ewes are just now dropping their lambs very fast; we have now 140 lambs, our stock of ewes being 200; the weather being severe, they require the utmost care, or numbers would perish; our in-lamb ewes go every day to a small piece of Swede Turnips, but return at night to a warm sheltered yard, well littered with straw, where they receive a liberal allowance of hay, and are regularly attended to by the shepherd, whose cottage adjoins the yard. Our forward down lambs are put on Turnips with the ewes at a week old; the ewes are supplied with common Turnips, cut with Gardener's cutters, and we find, more particularly in frosty weather, that it answers quite as good a purpose to cut common Turnips as it does Swedes, although it is not usually done in this neighbourhood, it being considered they can be readily consumed in the ordinary manner. Should the weather continue frosty, of which there is every appearance, the work of the farm will be of the same kind as during the past fortnight, having plenty of carting work and threshing to engage our attention. *J. B.*

Notices to Correspondents.

BACON: *JEM* supposes a far greater exactness of information to exist on agricultural subjects than is really the case. All we can say is that Bean, Pea, and Barley meals will probably make better bacon than Rye or Oats; but in what order they should stand to represent their relative excellence we cannot say.

MALT DUST: *H T W.* It is given to cows in various quantities, viz., from one to two pecks a day made into a mash, with hot water, giving it some time to steep. About two pecks of Oats, or one peck of Beans, a week, may be given to cows with advantage, in addition to other food. *W C S.*

MALT DUST FOR COWS: *Anon.* It may be steeped in either hot or cold water, and allowed to stand for some hours and so given as a mash. A peck a day may thus be given with other food. *W. C. S.*

SHEEP: *C.* They are the better for straw certainly; though wicker hurdles are not harder than, during the past fortnight, the ground has been on which flocks have been folded. A little straw would suffice.

SOUR BEER: *H Rumsey* says, "You lately recommended calcined chalk to cure stale beer. I tried it, and after the chalk had destroyed the acid the beer was flat. Afterwards I tried it in this way: In a two-hogshead cask we had about 56 gallons of very stale beer, turned by the thunder last summer, and not fit to drink. I drew it off, washed the cask out, and put in 2 lbs. of calcined chalk, and the beer on the chalk. I let it stand three days, then brewed 56 gallons of beer with 4 bushels of malt and 6 lbs. of Hops (worked as usual), and put it into the cask with the stale beer. It has been done about a month, and now tastes very soft and pleasant. My master says it is a hogshead of beer gained."

SYSTEMS OF AGRICULTURE *J W.* We hardly know what "A" and "B" differ upon. Our answer might be that there are very many more different systems of agriculture than either of them appear to assert.

Markets.

COVENT GARDEN, JAN. 19.

The severity of the weather has had its effect on the supply of Vegetables, and they are generally somewhat dearer than last week. Fruit is for the most part sufficient for the demand, except perhaps good dessert Pears and Apples, which are very scarce. Hothouse Grapes and Pine-apples are good for the season, Filberts and Walnuts are abundant, and Chestnuts plentiful. Oranges and Lemons are abundant, and there are some Seville Oranges in the market, but they are very dear and not good. Amongst Vegetables, Turnips and Carrots are rather scarcer. Cauliflowers and Broccoli the same; both have suffered severely from frost. Potatoes have altered little since our last account; there are large quantities of foreign ones in the market at from 50*s.* to 70*s.* a ton. Lettuces and other salading are dearer, and so are Mushrooms. Some Asparagus, Seakale, and Rhubarb may be obtained. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Chrysanthemums, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

Old Clover	84	90		JOSHUA BAKER.

POTATOES.—SOUTHWARK, Jan. 14.

The Committee report that the arrivals during the last week from the Continent have been very large, and it is with difficulty present prices are supported. The best Yorkshire Regents are much inquired for, and are realising much higher prices than any other kind of Potato in the market. The following are this day's quotations:—Yorkshire Regents, 70s. to 120s. per ton; Wisbeach do., 60s. to 75s.; Scotch do., 60s. to 75s.; Scotch cups, 50s. to 60s.; French whites, 65s. to 70s.; Rhenish and Belgian do., 60s. to 65s.

SMITHFIELD, MONDAY, Jan. 14.

We have a good average supply of Beasts, and but a scanty attendance of buyers. Trade is excessively dull, and our top quotations are with difficulty realised for choicest qualities. The number of Sheep is not large, quite adequate, however, to the demand, which is very small, owing to the low prices at the dead markets. A few choice Downs make 4*s.* 4*d.*, but so rarely that it is too high to quote. Veal maintains its price, in consequence of short supply. From Holland and Germany we have 153 Beasts, 190 Sheep, and 8 Calves; from Scotland, 100 Beasts; from Norfolk and Suffolk, 1500; and 900 from Leicester and Northampton.

		Calves	3 4 — 4 4
		Pigs	3 0 — 4 2

Beasts, 3334; Sheep and Lambs, 22,070; Calves, 62; Pigs, 217.

FRIDAY, Jan. 18.

The supply of Beasts is short, although tolerably good for the season, and in consequence late prices are well supported, although the trade is by no means brisk. The number of Sheep as usual on Friday, at this time of year, is small; so also is the demand. Prices remain unaltered from Monday, but they are with difficulty obtained. The deficiency in foreign supply causes a better trade for Calves; there are very few good ones on offer, they make fully 8d. per 8 lbs more than on Monday. From Holland and Germany there are 13 Beasts, 100 Sheep, and 14 Calves; from Scotland, 200 Beasts; and 122 Milch Cows from the home counties.

Beasts, 913; Sheep and Lambs, 2730: Calves, 95; Pigs, 225.

HOPS.—FRIDAY, Jan. 18.

Messrs. PATTENDEN and SMITH report that the market continues the same,

MARK LANE.

MONDAY, JAN. 14.—The market was tolerably well supplied with English Wheat by land carriage samples from the near counties; the millers, however, were by no means firm buyers (their trade being greatly interfered with by the large arrivals of foreign Flour), and a reduction of fully 1s. per qr. had to be submitted to before any progress could be made in sale, and the stands were not cleared at a late hour. A similar reduction had to be submitted to upon foreign Wheat, and the sale at the decline was trifling in the extreme.—Fine malting Barley must be quoted 1s. cheaper, whilst upon inferior descriptions a still greater abatement had to be conceded.—Oats maintained last week's rates.—Beans and Peas were both a slow sale, at 1s. decline upon the quotations of last Monday.

FRIDAY, JAN. 18.—Excepting foreign Barley, of which we have a good supply, the arrivals of grain, both English and foreign, have been small during the week. This morning's market was thinly attended, and business, as of late, of a very limited character. Prices of all articles may be considered nominally the same as on Monday, but where sales were imperative a slight reduction was necessary.—Indian Corn is inquired after at 29s. 6d. afloat.—The Flour market continues dull, without alteration in prices. The corn trade since this day se'nnight has continued inactive and depressed throughout the kingdom, and prices of home-grown Wheat have declined 1s. to 2s. per qr. in most of the English markets, whilst the turn for spring corn has been generally in favour of the buyers. Some purchases of low Wheat and Indian Corn afloat, and also Barley on the spot, have been made for Ireland during the week.

LIVERPOOL, TUESDAY, JAN. 15.—The arrivals of grain, Flour, &c., have been moderate during the past week. Trade generally was inactive this morning. The few sales of Wheat were at a reduction from last Tuesday of 1d. per bushel on foreign, and 2d. on Irish. Oats declined ½d. per bushel. Barley, Beans, and Peas are each a dull sale, and prices rather weaker. Flour was the turn cheaper.

TO BE LET, with immediate possession, a NURSERY AND MARKET GARDEN, at Hampton, in the county of Middlesex, containing about 3½ acres, partially walled in, and well stocked; together with a Close of valuable Pasture adjoining, containing nearly 3 acres. There is a Cottage on the estate, and a Stable with Loft over, and every convenience for carrying on the business.—For terms and particulars, apply to Mr. BRADEL, 25, Gresham-street, London.

TO MARKET GARDENERS, NURSERYMEN, FLORISTS, AND OTHERS.

TO BE LET, within 7 miles of London, and near a Railway Station, an extensive range of FORCING HOUSES and PITS, completely fitted with hot-water pipes and apparatus, together with an assortment of Vines, in excellent condition, and all buildings, outhouses, and conveniences necessary for carrying on an extensive business. For particulars, apply to Messrs. RICE, Brothers, Auctioneers, &c., 263, High-street, Southwark, Surrey.

TO NURSERYMEN AND OTHERS.

TO BE DISPOSED OF, an old established NURSERY, about 100 miles from London, and in the immediate neighbourhood of a fashionable watering-place, the owner retiring from the business. The stock comprises a large quantity of Evergreens, Rhododendrons, &c. To any person who could command a small capital, this would prove a most advantageous opportunity. For further particulars, apply to Mr. D. A. RAMSEY, Auctioneer, &c., Brompton Nursery, Brompton, Middlesex.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded, on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES AND HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

THE IMPROVED "FLUE BOILER" AND FURNACE.

W. HILL begs respectfully to inform the numerous applicants for his "FLUE BOILER" of a small and intermediate size, that he shall be prepared, early in December, to supply sizes to suit every description of Apparatus, from that of 100 feet of 3-inch pipe to 2000 feet of 4-inch pipe. A List of Sizes and Prices will shortly be published. W. HILL guarantees his Boilers to be the most effective and economical of any in use. Horticultural Works, Greenwich, Jan. 19.

HOT-WATER PIPES AND TROUGH PIPES, with all the usual connexions.

J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, keeps a very large stock of Hot Water and Trough Pipes, with Elbows, Syphons, Tee Pieces, Collars, Flange Sockets, and Spigots, Throttle Valves, &c., of excellent quality, and at very low prices. Parties requiring the work to be done can have good workmen sent to any part of the kingdom, with everything requisite for the heating, &c., at a stated sum. Rain-water pipes, Sutters, Sash-weights, Railing Bars, Air Bricks, and numerous other castings are also kept at J. JONES's, Iron Bridge Wharf, No. 6, Bankside, London.

GRAY, ORMSON, AND BROWN, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any enquiries They beg also to say the building only is referred to, as the Heating Apparatus was not erected by them.

GRAY, ORMSON, and BROWN, have also the honour of referring to many of the nobility and gentry in the country, and to several of the London Nurseries.

N.B. Plans and Estimates furnished free.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

ANNUAL COUNTRY MEETING OF 1850, TO BE HELD AT EXETER,

PRINCIPAL DAY OF THE SHOW, THURSDAY, JULY THE 18th.

Members have the privilege of a free entry, and Non Subscribers are allowed to compete, on the payment of 10s. on each Certificate. Forms of Certificate to be obtained on application to the Secretary, 12, Hanover-square, London. All Certificates for the entry of Implements, and the space required for their exhibition in the Show-yard, must be returned, filled up, to the Secretary, on or before the FIRST OF MAY, and all other Certificates by the FIRST OF JUNE; the Council having decided that in no case whatever shall any Certificate be received after those dates respectively.

In the application for Certificates, the character and age of the animals to be exhibited should be stated, in order that the proper forms of Certificate may be sent.

PRIZES FOR LIVE STOCK: OPEN TO GENERAL COMPETITION.

I.—CATTLE.

To the owner of the second-best ditto ... ... 10*l.*
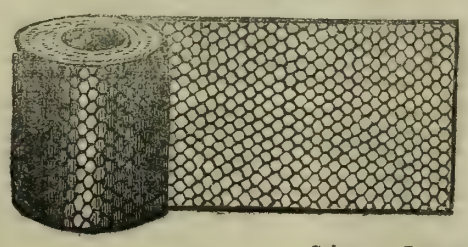
3—To the owner of the best pen of five Shearling Ewes of the same flock ... ... 10*l.*
To the owner of the second-best ditto ditto ... 5*l.*

IV.—PIGS.

1—To the owner of the best Boar of a large breed ... 15*l.*
To the owner of the second-best ditto ditto ... 5*l.*
2—To the owner of the best Boar of a small breed ... 15*l.*
To the owner of the second-best ditto ditto ... 5*l.*
3—To the owner of the best breeding Sow of a large breed 10*l.*
4—To the owner of the best breeding Sow of a small breed 10*l.*
5—To the owner of the best pen of three breeding Sow-pigs of a large breed, of the same litter, above four and under eight months old ... ... 10*l.*
6—To the owner of the best pen of three breeding Sow-pigs of a small breed, of the same litter, above four and under eight months old ... ... 10*l.*



By order of the Council, JAMES HUDSON, Secretary.
London, Dec. 13, 1849.

*** Prize Sheets, containing the Conditions of these Prizes, and the Regulations for their competition, may be had on application by letter or otherwise, to the Secretary, 12, Hanover-square, London.

DRAINAGE OF ESTATES.

ALFRED TUCKETT, having had considerable experience in Draining Land, more particularly on heavy wet clays, and being a manufacturer of very superior Drain Pipes and Tiles, offers his services as CONTRACTOR FOR THE DRAINAGE OF ESTATES. All contracts undertaken by A. TUCKETT will have his own personal superintendence, and from his thorough knowledge of such work, he feels confident that he can execute it to any extent, and at such a moderate cost, that the interest will be cheerfully paid by tenants.
Warmley, near Bristol.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

DR. NEWINGTON'S IMPLEMENTS; early orders must be given to insure early execution.—Messrs. DUFAUR and Co., of 21, Red Lion-square, London, are now in a position to execute orders for these Implements; a Prospectus and Lecture on Seeding sent gratis on application. Should Mr. J. Ross not have given up all idea of a contest in dibbling, a party may be heard of at the above address willing to back Dr. Newington's Implement for 50*l.* against Mr. Ross's for 25*l.*, subject to certain conditions, to be determined on by umpires on each side, notice to be given through this Journal.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION, especially with regard to Agriculture, under the immediate patronage of the Right Hon. Lord RENDLESHAM, M.P.; conducted by Mr. G. DOWNES. The Classical and Mathematical branches are entrusted to a Graduate of Cambridge; the Commercial and other departments to efficient assistant masters. A Laboratory, Collection of Philosophical Apparatus, Library, &c., are attached to the school. Terms are moderate and inclusive, and may be known upon application to Mr. G. DOWNES, Wickham Market, Suffolk.

CAUTION.

THE PATENT ALKALI COMPANY'S METALLIC BLACK AND PURPLE-BROWN PAINTS.—Attempts having been made to sell other Paints by the aid of the Company's Testimonials, the Public are informed that the undermentioned are the only authorised Agents for the sale of these important and valuable productions.

AGENTS: Messrs. Bryant and May, 133, Tooley-street, London; Mr. James Low, Bristol; Messrs. Evans and Hodgson, Exeter; Mr. Samuel John Fill, Yarmouth, Norfolk; Mr. D. Sandeman, Glasgow; Mr. G. Sandeman, Dundee; Mr. R. Newby, Bradford, Yorkshire; Mr. R. S. Farr, Edinburgh; Mr. W. Bailey, Wolverhampton; Mr. Robert Oxland, Plymouth; Mr. H. J. Buchan, Southampton; Mr. Edward Wilson, Manchester; Mr. H. W. Potter, Manchester; Mr. H. W. Lowry, Liverpool.

Orders will also be received, and information furnished, by the Secretary, Mr. JOHN A. WEST, 1, New Broad-street, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

TAX ON SUCCESSIONS, BURDENS ON LAND, &c.

New Edition, considerably improved throughout, 12mo, with Plates and Diagrams, price 6s. 6d. bound,

KEITH'S TREATISE ON THE USE OF THE GLOBES; or, a Philosophical View of the Earth and Heavens. New Edition, greatly improved by ALFRED TAYLOR, M.D. F.R.S., Lecturer on Chemistry, &c. in Guy's Hospital; R. A. LE MESURIER, B.A., Scholar of Corpus Christi College, Oxford; and J. MIDDLETON, Esq., Professor of Astronomy.

KEY. Adapted to the New Edition, by Professor MIDDLETON. 12mo, 2s. cloth.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

PROFESSOR SCHLEIDEN'S BOTANY.

Just published, in 8vo, with Plates and Woodcuts, price 21s.

PRINCIPLES OF SCIENTIFIC BOTANY; or, BOTANY AS AN INDUCTIVE SCIENCE. By Dr. M. J. SCHLEIDEN, Extraordinary Professor of Botany in the University of Jena. Translated by EDWIN LANKESTER, M.D., F.R.S., F.L.S., Lecturer on Botany at the St. George's School of Medicine, London.

"We congratulate our readers on the appearance of an English edition of this remarkable work, by a gentleman so capable to do full justice to it as Dr. Lankester. It cannot fail to interest deeply all true lovers of Botanical Science, and we believe it will be considered a valuable addition to our Botanical literature."—*Jameson's Philosophical Journal.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

HOUSEKEEPING, FURNISHING, COOKERY, &c. &c.

In 1 large vol. 8vo, with 1000 Woodcuts, price 50s.,

WEBSTER AND PARKES'S ENCYCLOPÆDIA OF DOMESTIC ECONOMY.

"The contents comprise everything which enters into the comfort, convenience, necessity, utility, and enjoyment of a family."—*John Bull.*

"This large volume contains scarcely a line which may not be made useful in extending the experience of young and old housekeepers."—*Britannia.*

"There is no sort of information necessary in housekeeping which is not found in this Encyclopædia."—*Literary Gazette.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

In one very thick vol. 8vo, price 2l. 10s. the 3d Edition of DR. URE'S DICTIONARY OF ARTS, MANUFACTURES, AND MINES; containing a clear Exposition of their Principles and Practice. Third edition, corrected throughout; with 1241 Woodcuts.—Also,

RECENT IMPROVEMENTS in ARTS, MANUFACTURES, and MINES; being the 2d Edition of Dr. Ure's Supplement to 3d Edition of his "Dictionary." 8vo, price 14s.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

CHEMISTRY FOR SCHOOLS, BY DR. R. D. THOMSON.

Just published, in fcp. 8vo, with Woodcuts, price 7s. cloth,

SCHOOL CHEMISTRY; or, Practical Rudiments of the Science. By ROBERT DUNDAS THOMSON, M.D., Lecturer on Chemistry in the University of Glasgow.

"The title of this little volume is most happily chosen. Dr. Thomson has contrived to adapt his matter to the use of Schools, and to make such selections from the science as can be readily apprehended by the young. No youth can peruse this book without deriving from it a large amount of useful information."—*Medical Gazette.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

HUNTING, COURSING, &c.

One very thick volume, illustrated with nearly 600 Engravings on Wood, 8vo, 50s. cloth,

AN ENCYCLOPÆDIA OF RURAL SPORTS: comprising Hunting, Racing, Shooting, Fishing, Coursing, Diseases of Horses and Dogs, Stable and Kennel Management, Training, &c. By D. P. BLAINE, Esq.

"A perfect library for all lovers of country sports, for all country gentlemen, and for all persons who delight in the manly and healthy recreations which are afforded to the inhabitants of no country in such perfection as to the inhabitants of the British Isles."—*Times.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

MRS. HEY'S "SPIRIT OF THE WOODS."

Just published, in 1 vol., uniform in size with "Thomson's Seasons illustrated by the Etching Club," price One Guinea, illustrated with beautifully coloured plates,

SYLVAN MUSINGS; or the Spirit of the Woods. By Mrs. HEY. New Edition.

By the same Author, uniform with the above in size and price,

THE MORAL OF FLOWERS; or, Thoughts gathered from the Field and the Garden. Illustrated with beautifully coloured Plates.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Fifth Edition, 8vo, 10s. 6d. cloth,

BAYLDON'S ART OF VALUING RENTS AND TILLAGES, and the Tenant's Right of Entering and Quitting Farms explained. Adapted to the use of Landlords, Land Agents, Appraisers, Farmers, and Tenants. Re-written and enlarged by JOHN DONALDSON. With a Chapter on the Tithe Commutation Rent Charge.

"A work equally valuable to the principal or the agent. The new statements and calculations incorporated will be found of great practical use. This work should be read and revised by every one having an interest in the soil, whether as landlord, tenant, or agent."—*Mark Lane Express.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

In foolscap 8vo, with Plates and Woodcuts, price 7s. 6d. cloth,

MISS ACTON'S MODERN COOKERY-BOOK. For the use of Private Families. The Ninth Edition, with directions for CARVING, and other Additions and Improvements.

"The whole of Miss Acton's recipes, with a few trifling exceptions, which are scrupulously specified, are confined to such as may be perfectly depended on, from having been proved beneath our own roof, and under our own personal inspection. We add, moreover, that the recipes are all reasonable, and never in any instance extravagant. They do not bid us sacrifice ten pounds of excellent meat, that we may get a couple of quarts of gravy from it; nor do they deal with butter and eggs as if they cost nothing. Miss Acton's book is a good book in every way; there is right-mindedness in every page of it, as well as thorough knowledge and experience of the subjects she handles."—*Medical Gazette.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

BLACK ON BREWING—FOURTH EDITION.

Just published, 4th Edition, in 1 vol. 8vo, 10s. 6d. cloth,

A PRACTICAL TREATISE ON BREWING, based on Chemical and Economical Principles; with Formulæ for Public Brewers, and Instructions for Private Families. By WM. BLACK, Practical Brewer. Fourth Edition.

"Invaluable to the practical brewer and private families: to the former we recommend it as a work ably treating of their art; to the latter, as one which they will find an efficient and correct guide."—*Chemist.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

INTRODUCTION to ENGLISH PARSING. 18mo, 2s. 6d.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

New Edition, in 8vo, with Plates and Woodcuts, 18s. cloth,

OUTLINES of ASTRONOMY. By Sir JOHN F. W. HERSCHEL, Bart. &c. &c.

"We take our leave of this remarkable work, which we hold to be, beyond a doubt, the most remarkable of the works in which the laws of astronomy and the appearances of the heavens are described to those who are not mathematicians nor observers, and recal to those who are."—*Athenæum.*

"In the earlier portions more especially much new matter is introduced.....To all intents and purposes, indeed, *Outlines of Astronomy* must be considered a new work,—so careful has been the revision, correction, and remodelling of the original treatise; so numerous the additions to it, and so important the new trains of inquiry opened up."—*Examiner.*

London: LONGMAN, BROWN, GREEN, and LONGMANS; and JOHN TAYLOR.

The 15th Edition, enlarged and corrected, in 2 vols. fcp. 8vo, price 14s. cloth,

CONVERSATIONS ON CHEMISTRY: in which the Elements of that Science are familiarly explained and illustrated by Experiments. By JANE MARCET.

"In the present edition the author has attempted to give a sketch of the principal discoveries which have recently been made in Chemistry: and wishing that her pupils should obtain some knowledge of the progress which has taken place in Agriculture, resulting from its connexion with Chemistry, she has found it necessary to add a Conversation upon this subject."—*Extract from Preface.*

By the same Author, New Editions of

CONVERSATIONS on LAND and WATER, Map, 5s. 6d.; on VEGETABLE PHYSIOLOGY, Plates, 9s.; on NATURAL PHILOSOPHY, Plates, 10s. 6d.; on POLITICAL ECONOMY, 7s. 6d.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Eighth Edition, thoroughly revised, corrected, and improved, in one thick volume, 8vo, price 30s. cloth,

HOOPER'S MEDICAL DICTIONARY. Eighth Edition, revised, corrected, and improved, by KLEIN GRANT, M.D., Lecturer on the Practice of Physic at the Aldersgate School of Medicine, &c.

"Compared with the early editions, it may, from the great increase of matter, be regarded as a new work. Dr. Grant has succeeded in preserving the plan of the late Dr. Hooper, and at the same time in giving to his labours that extension of detail which the recent progress of medicine had rendered necessary....This edition will be found more extensively useful than any of those which have preceded it."—*Medical Gazette.*

London: LONGMAN, BROWN, and Co.; Hamilton and Co.; Simpkin and Co.; Whittaker and Co.; S. Highley; T. Bumpus; Houlston and Co.; H. Renshaw; B. Fellowes; H. G. Bohn; J. Churchill; Orr and Co.; Bickers and Bush; G. Routledge; Tegg and Co.; Griffin and Co.; and E. and F. Waller. Edinburgh: A. and C. Black; and Maclachlan and Co. Dublin: Fannin and Co.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JANUARY 19, 1850.

SEEDLING RANUNCULUS ROOTS. — Selected show varieties, containing edged, spotted, striped, mottled, and beautiful self colours, of 12 years' selection, and which have gained upwards of 40 first prizes, are now offered in one mixture, for the first time, at 21*s.* per 100.

SAMUEL WALTERS, Hilperton, Trowbridge, Wilts.

CAMELLIA JAPONICA—DRYSDALE'S SEEDLING.—The Subscribers are now prepared to let out their magnificent unrivalled rose-striped CAMELLIA, at Five Guineas per plant; and when five plants are ordered, one extra will be added, and forwarded as soon as orders for 20 plants are received. The Stock, which consists of 26 plants, if preferred, will be sold for 105*l.* Coloured Engravings, warranted correct, will be forwarded at 5*s.* each, and if plants are afterwards ordered, the price of the engraving will be deducted.

DRYSDALE AND Co., Glasgow, Jan. 26.

THE REAL CASSABAR MELON.

THE LARGEST AND FINEST MELON IN THE WORLD.

J. WEEKS AND CO. beg to offer to the Nobility and Gentry the above for Sale, at 5*s.* per packet. Early orders are requested, there being but a limited quantity to dispose of.—J. WEEKS and Co., King's-road, Chelsea.

COLE'S SUPERB SOLID RED CELERY.—This fine Celery has given such entire satisfaction, not only for the great size to which it attains, but for its unequalled crispness and exquisite nut-like flavour, that it needs no further recommendation. Seed may be had genuine from the grower, WILLIAM COLE, Dartford, Kent, in sealed packets, 1*s.* 6*d.* each, or the amount in postage stamps; also of Messrs. J. and J. FRAZER, Leyton, Essex; Mr. BUSTARD, Maidstone, Kent; Mr. CRIPPS, Tunbridge Wells, Kent; Mr. DENYER, 82, Grace-church-street, London; Mr. TILEY, 16, Pulteney-bridge, Bath; Mr. FRANCIS, Hertford; Mr. MILNER, Bradford, Yorkshire; Messrs. J. and J. FAIRBAIRN, Clapham, near London; Messrs. GARAWAY, MAYES, and Co., Bristol; and of Mr. SMITH, Westerham, Kent; Mr. PONTEY, Nurseryman, Plymouth; and Mr. IVERY, Nurseryman, Peckham, Surrey; Messrs. ARCHIBALD WOOD and Co., Nurserymen and Seedsmen, Barboune, near Worcester; and Mr. POPE, Nurseryman, Gib Heath, near Birmingham.

*** A liberal allowance to the trade.

W. COLE further states, in justice to himself and agents, that his entire stock of seed saved in 1849 is in his possession and that of his agents, from whom it may be had new and genuine, bearing his name and address printed on the envelope.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2 feet, is 3 weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5*s.* per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetar's, and 20 to 24 per stem. 2*s.* per quart.

BURBIDGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s.* per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be furnished on application, and every article connected with the trade supplied on terms to defy competition. Garden Tools, Nets, Mats, Mushroom Spawn, and Potatoes saved from selected stocks at moderate prices.

FOREST TREES, &c.

PETER LAWSON AND SON'S LIST.—No. II. for 1850 is now ready, and may be had on application, or a copy will be sent free of postage to any part of the United Kingdom or British Colonies, containing prices of—

Seedling Forest Trees.	Plants for Hedging, Underwood, &c.
Seedling Ornamental Trees and Shrubs.	Quartered Trees
Transplanted Forest Trees	Ornamental and Rare Forest Trees
Transplanted Fruit Tree Stocks	Shrubs, Ericaceæ, & Climbers

Coniferous Trees and Shrubs, including nearly 300 species and varieties, among which are all the new sorts lately introduced.

The next number of "PETER LAWSON and SON'S LIST" will comprise a Catalogue of Flower Seeds, annual, biennial, and perennial, accompanied by a Treatise, containing simple practical directions for selecting and raising those suitable for cultivation in this country.

PETER LAWSON and SON, Nurserymen and Seedsmen to the Highland and Agricultural Society of Scotland, Edinburgh, have appointed as their

AGENT IN LONDON,

Mr. J. C. SOMMERS, 159, Fenchurch-street, who will afford every information as to supplies of Forest Trees, and Garden or Agricultural Seeds.

*** There are ready and economical means of transit from Edinburgh, both by Steam and Railway, to all parts of the Kingdom.—George IV. Bridge, Edinburgh, Jan. 26.

JOHN SUTTON AND SONS strongly recommend the above sorts of Potatoes, which are entirely free from disease.

ALL KINDS OF GARDEN SEEDS NEW AND TRUE, at low prices, CARRIAGE FREE, as see SUTTON'S Priced Catalogue, which will be sent gratis, on receipt of one penny stamp for postage.—Reading Seed Warehouse, Reading, Berks.

*** Choice Kitchen Garden and Flower Seeds FREE BY POST, as see our Advertisement in the next page.

CORNWELL'S "VICTORIA" RASPBERRIES.

G. CORNWELL is now sending out strong canes of the above, at 25*s.* per 100; or 3*s.* 6*d.* per dozen. To be had at E. CHARLWOOD'S, Covent-garden; NOBLE'S Fleet-street; and of GEORGE CORNWELL, Market-Gardener, Barnet, Herts.

AMERICAN PLANTS.

GEORGE BAKER begs to inform the gentry and public he has published a NEW CATALOGUE of his AMERICAN AND CONIFEROUS PLANTS, &c., and may be had on application.—Windlesham Nursery, Bagshot, Surrey.

SPLENDID NEW DIANTHUS.

J. REID begs to inform the Public that he has succeeded in saving a small quantity of his new DIANTHUS REIDII. The ground colour is bright scarlet, laced with white, the truss or head of bloom is larger than a Dahlia flower; its dwarf habit is suitable for any situation. By sending 12 Postage stamps to J. REID, Mount Scilla Nursery, near Chippenham, Wilts, in return a packet of seed will be sent.

WILLIAM MASTERS, Exotic Nursery, Canterbury, having the largest and most diversified stock of NURSERY PLANTS in the country, and by long experience being expert in determining the characteristics of various sites of ground, so as to plan and plant them most desirably, offers his assistance to gentlemen requiring the aid of a Landscape Gardener, or wanting Nursery Plants at the most economical prices. Planning and Planting by contract, if required. Communications to the above address will receive immediate attention.

GARDEN SEEDS of a superior quality may be had in Collections of 1*l.*, 2*l.* or 3*l.* worth, containing a supply for the whole year, upon application to the Subscriber. Also, a large Collection of the best FLOWER SEEDS, in assortments of 25 kinds for 6*s.*; 50 for 10*s.*; 100 for 18*s.* Larger quantities in proportion. Orders amounting to 2*l.* and upwards delivered to any station on the South Eastern Railway.

WILLIAM MASTERS, Exotic Nursery, Canterbury.

BASS AND BROWN'S SEED AND PLANT LIST, stamped to go free by post. Copies forwarded to any address. — The above comprises their General Descriptive priced Spring Catalogue, in which will be found a rich assortment of the newest and best articles that can be procured.

PART 1 contains Lists of new and choice FLOWER AND VEGETABLE SEEDS. The Flower Seeds are in five divisions, Hardy, Half-hardy, and Tender Annuals; and Hardy and Greenhouse Perennials; descriptive of colours, heights, prices, &c.; prefaced by a page of useful Remarks on Sowing and Raising Seeds, with allusions to such as require peculiar care. The Vegetable List contains the time of sowing each description of Seed, giving heights of Peas, and a variety of other useful information.

PART 2. ROOTS, FRUITS, AND BULBS, consisting chiefly of a selection from their Autumn Catalogue of such as are required for spring planting.

Part 3. A descriptive priced List of Geraniums, Fuchsias, Dahlias, Petunias, Verbenas, Chrysanthemums, Cinerarias, Achimenes, Gloxinias, Azalea indica, Stove and Greenhouse Plants, and a variety of Bedding and other Miscellaneous Plants.

PART 4. NEW PLANTS OF 1850, to be sent out in the Spring, consisting of Petunias, Fuchsias, Verbenas, Dahlias, &c.

A separate List of Agricultural Seeds.

Seed and Horticultural Establishment, Sudbury, Suffolk.

PLANTING SEASON.

ALFRED BALSTON begs to inform planters he has still a large proportion of his Nursery Stock to dispose of, which, in consequence of having relinquished the trade, he offers at very reduced prices. The Stock comprises every variety of ORNAMENTAL, FRUIT, and FOREST TREES, and all the best kind of SHRUBS in cultivation, no expence having been spared in the collection, and from the light nature of the soil in which it has grown, the plants have all a mass of fibrous root, which causes them to grow most luxuriantly after being transplanted.

A.B. particularly recommends the following: Common Laurel, 9 inches to 1 foot, 15*s.*; 1 to 2 feet, 30*s.*; 2 to 4 feet, 40*s.*; 4 to 6 feet, 80*s.* per 1000. Portugal Laurels, 1 to 2 feet, 10*s.* per 100. Rhododendron ponticum, 1 to 2 feet, 30*s.*; 3 to 4 feet, 60*s.*; 4 to 5 feet, 100*s.* per 100. Ghent Azaleas of all the finest kinds, specimen plants, 2*s.* 6*d.* each; smaller ditto, 6*s.* per dozen. Rhododendron campanulatum, caucasicum, catawbiensis, &c., 100*s.* per 100. Standard Roses of all the finest sorts, 12*s.* per dozen. A large stock of Evergreen Oak in pots and transplanted; also common Oak, Elm, Beech, Birch, Berberis, Hornbeam, Privet, &c.

Orders must be accompanied by remittances. Orders amounting to 5*l* delivered free.—Poole Nursery, Dorset.

RENDLE'S DESCRIPTIVE CATALOGUE OF SEEDS can still be obtained GRATIS, on receipt of two penny stamps, to pay the postage.

OPINIONS OF THE PRESS.

Dr. LINDLEY, in the *Gardeners' Chronicle*, Dec. 22, 1849, says, "*This contains lists of good vegetables, with useful notes appended to the names of many of the sorts. . . . It is a well-arranged Catalogue, and will be found of service to all purchasers of Seeds.*"

The Editor of "The Midland Florist," for January, 1850, says, "*We have just received the General Catalogue of Garden, Agricultural, and Flower Seeds, sold by William E. Rendle and Co., Plymouth, which, from its excellence, well merits something more than a passing notice, and happy shall we be from time to time (with Messrs. Rendle's permission) to extract some of its valuable information for the benefit of our readers. . . . The Flower Seed List is peculiarly comprehensive, and gives to each variety its scientific name, hardihood, time of duration, colour, height, and time of flowering. Our readers will thus see that, from its immense utility, we can scarcely say too much in its recommendation; and we are sure that the name of the eminent firm will be a sufficient guarantee that every article they send out will not only be true to name, but also of the best possible quality.*"

Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall, and are warranted double, and of which large and choice roots are selected at 4*s.* per dozen. Also, expected, about the end of January, a choice collection of Orange, Lemon, Citron, and Shaddock Trees, together with Catalonian, Azorian, and Arabian Jessamine plants, any of which may be bespoke.—N.B. Orders by post punctually attended to.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 2*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

"BROMHAM HALL" GREEN FLESH MELON,
Is the finest flavoured in the World.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior Melon called "BROMHAM HALL" GREEN FLESH MELON, respectfully invites the attention of the public generally, to the superiority of this over all other Melons ever yet sent out. It was forwarded to the Editor of the *Gardeners' Chronicle*, July 22d, 1848, for his judgment, and he was of decided opinion that the Bromham Hall Melon was the finest flavoured fruit he had ever tasted. It was exhibited at the Chiswick Exhibition, July 11, 1849, where it was awarded by the judges the Silver Knightian Medal for the best flavoured green flesh Melon. It was again sent to Dr. LINDLEY, August 11th, 1849: "We have received your Bromham Hall Melon, it was much over ripe, nevertheless it was by far the best flavoured Melon we ever tasted." It was again exhibited at the Horticultural Society's Rooms, Regent-street, September 4th, 1849, and was again pronounced by the judges to be the best flavoured Melon they ever tasted, and was awarded the Banksian Medal. The fruit is very handsome—it is round shaped, hollow crown, beautifully netted, thin skin, flesh very firm and solid, melting flavour, very free setter, and abundant bearer. Weight, from 3 lbs. to 4½ lbs. It has been found to do well during the summer, without bottom heat. It may be as easily grown by an amateur in a frame as the common Vegetable Marrow. There is a great advantage in it for the fruiterer, as it will retain its fine flavour for a considerable time after being cut. Sold in packets of 6 seeds, 2*s.* 6*d.*; larger do. of 15 seeds, 5*s.* Also the following fine varieties can be highly recommended all true:

	s.	*d.*	
Queen Melon	1	6	per packet.
Bowood Green Flesh	1	0	,,
Beechwood do.	1	0	,,
Windsor prize do., 1*s.*; Emperor ...	1	0	,,
Fleming's Trentham Hybrid	1	0	,,
Duncan Green Flesh do. improved ...	1	0	,,
Hampton-court Green Flesh	1	0	,,
Egyptian do. do. improved	1	0	,,
FIRST PRIZE CUCUMBER, VICTORY OF BATH	2	0	,,
Gordon's White Spine	1	6	,,

These two Cucumbers are unequalled for their superiority for exhibition, having been thoroughly proved to the satisfaction of hundreds of growers. They will be found to grow as well out of doors on a ridge, or against a wall, during the summer months, as a common ridge Cucumber; also equally as productive. Length, from 20 to 26 inches.

N.B. It is with regret we state that numerous parties have been disappointed by purchasing an inferior variety under the name of Victory of Bath. E. T. begs to say it has proved not to be the true variety sent out by him.

Lord Keynon's Favourite (winter Cucumber), a very scarce variety. It is the best for winter cultivation ever yet grown; it is very hardy, and free setter, and never shanks off; fruit very handsome. Length, about 14 inches. 2*s.* 6*d.* per packet. A packet of each of the three varieties, 5*s.*; if preferred, also a packet of the Bromham Hall Melon will be included with the three Cucumbers for 7*s.*—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or 1*d.* postage stamps.

SEEDS FREE BY POST.

HOME GROWN GARDEN SEEDS.

—The undermentioned choice sorts of SEEDS are particularly recommended as being the very best yet introduced, and *good useful packets* of either sort will be SENT FREE BY POST AT THE PRICES AFFIXED.

York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

SUPERB NEW MELON.

GARAWAY, MAYES, AND CO.,

having purchased the whole stock of seed of that superior MELON called CAMERTON COURT GREEN-FLESH, beg to inform all lovers of this delicious fruit, that they can supply it in packets at 2*s.* 6*d.* each.

Notice of Fruits, in Gardener's Journal of September last. —"J. P. Your Green-flesh Melon, about 2½ lbs., is a neat, well-grown fruit, sweet, and melting, and the flesh thick." For the 25th September.—"This is really (we gladly confess it) a very good Melon."

G. M. and Co. have likewise the whole stock of the BRISTOL CHAMPION CUCUMBER, which they can strongly recommend. With the following approved sorts.

Bristol Champion—long, hardy, black spine; excellent. 2*s.* 6*d.* per packet.

Holm Pierpoint Wonder—fine long white spine. 1*s.* per pkt.

Great Britain, excellent; Victory of Bath, excellent; Roman Emperor, early long prolific; and Cuthill's Black Spine, all at 1*s.* per packet.

Sion House, (true), best for house culture, 1*s.* per packet.

Kelway's Victory, very prolific black spine, excellent for pot culture, 1*s.* per packet.

Beechwood Melon, Duncan's improved green-flesh, Cabool, Cuthill's early scarlet flesh, Hampton Court, and Egyptian green flesh, all at 1*s.* per packet.

G. M. and Co. have now their large stock of Vegetable and Flower Seeds for this season, with the following new and approved varieties, well worth the attention of their friends.

Railway Peas, the earliest known, fine pod; Champion of England, ditto, excellent for second crop; Great Britain, British Queen, Pond's or Ward's Incomparable, varieties of Knight's Marrow, the finest Pea grown; Norris's Superb Dwarf Cabbage; Bundy's fine dwarf Brussels Sprouts; Highclere White Broccoli, the latest known, lasting until Cauliflowers come in; Walcheren Broccoli, true; Coles' Superb Red Celery, from the grower; Superior Garnishing Parsley; German Stocks and Asters, imported annually; Nemophila maculata, new; Phlox Drummondi oculata, new; Ipomœa rubra cærulea.

Durdham Down Nurseries, Bristol, Jan. 26.

Samples, Directions, and Testimonials sent by post.—CROGGON and Co., 2, Dowgate-hill, London.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. HARTLEY and Co., precisely at their prices. Cut to order in panes of

8 by 6	and under 10 by 8	at 4½*d.* per foot.	
10 by 8	,, 14 by 10	at 5*d.*	,,
14 by 10	,, 1½ foot	at 5½*d.*	,,
1½ foot	,, 3 feet	at 6*d.*	,,

PACKED IN BOXES OF 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

Milk Pans from 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d.*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

JAMES PHILLIPS and CO., 116, BISHOPSGATE STREET WITHOUT, LONDON.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co. 48, Leicester-square, London.

which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO.,

have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.

—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Sulphate of Ammonia, Sulphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees of Parker's Cement, Established 1796. Drain Tiles, Pipes, &c.

BECK'S PELARGONIUMS, and other raisers' Flowers.—Now ready for selection and going out. Twelve of the following varieties, including box and carriage to London, will be forwarded in exchange for post-office order on Brentford for Two Guineas. They are well-rooted in 3-inch pots, and ready for an immediate shift into a larger size:

Blanche, Centurion, Cracker, Forget-me-not, Ariel, Cassandra, Cruenta, Gustavus, Gulielma, Grandiflora, Junii, Negress, Rosamond, Sundown. Or Nine of the above, and Hoyle's Crusader, or Foster's Victory.

EDWARD BECK, Worton Cottage, Isleworth.

MYATT'S LINNÆUS RHUBARB.

J. MYATT AND SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1*s.* 6*d.*; ditto, Mitchell's Royal Albert, 1*s.* 6*d.*; Victoria, 9*d.* The usual Trade allowance.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford.—Jan. 26.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.

No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pints Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. £3 3 0
No. 2, two-thirds of the above 2 2 0
No. 3, one-third ditto 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

*** Cole's Superb Dwarf Red Celery. 1*s.* per packet.

CHEAP! CHEAP!! CHEAP!!!

CHARLES DALY AND SON beg to refer their friends and the public, who should be in want of cheap Thorn Quick, cheap Irish Yews, cheap Shrubs, cheap Forest Trees, and cheap Early Seed Potatoes at 5*s.* per bushel, to their Advertisement in the *Gardeners' Chronicle* of the 27th of October, and 3d and 10th of November last. Their Catalogue of Garden and Farming Seeds sent free by post, containing a good many of their own growing, which will be seen by their Advertisement.

They will also feel much obliged by their customers paying their last year's account, as they have no wish to put them to expense.—Coleraine, Ireland, Jan. 26.

IN his column of objections to APPRENTICE FEES, and of criticisms upon Gardeners, our correspondent "ELPIDOPHORUS" (p. 38), whose name we venture to translate into TIMOROUS, has missed his aim. But if he has failed to touch the substance, his blows have fallen fast and furious upon its shadow. The question we raised was whether or not gardeners are justified in taking apprentice fees. Mr. TIMOROUS disposes of that by a simple negative, and immediately assails the practice of calling gardeners professional men. It is impossible to acquiesce in either his judgment or his criticism.

We expressly stated that apprentice fees are not to be taken by a gardener without the sanction of his employer; but that, *with such sanction*, a gardener is as much justified in receiving them as anybody else. Our opinion was, therefore, against a gardener having any abstract right to such advantages, and consequently, against the justice of complaints when such fees are disallowed. If allowed, it is by the grace and favour of the employer. Now what else does Mr. TIMOROUS himself mean, when he says that "the employer is the only person who can guarantee effectiveness and permanency to the probation and instruction of an apprentice?" Does not the sanction of the employer, which we have ourselves insisted upon, give the required guarantee, so far as permanency is concerned? Not as to effectiveness, certainly; nor has our correspondent explained how an employer can guarantee the attention of a gardener to his charge. We may therefore say that, on the one hand, Mr. TIMOROUS's language conveys an objection to the system, and that, on the other, it waives the objection, adopting the very views which it seems to be intended to oppose.

For ourselves, we entertain no doubt that when circumstances are favourable, employers must find it to their advantage to encourage their gardeners, by permitting them to take an apprentice or two. Such a permission would be regarded as a gratuity for long service, or an expression of approval for good conduct. Nor can it be denied that the system works well in good hands, although we admit that it is sometimes, like other privileges, scandalously abused Whether or not however the permission is granted is a matter of private arrangement with which no one has a right to interfere except by way of such general considerations as we have, not we hope improperly, suggested.

The second part of Mr. TIMOROUS's letter is a quarrel with the name "profession" often given to gardening by ourselves and others. We should have hardly thought the point worth an argument; but since it has been raised we must endeavour to show that the term is strictly appropriate. We go into this dispute with the less reluctance, because no one will suspect us of the slightest intention of raising gardeners to a false position—the worst thing that could befal them, and the last thing which their true friends would attempt. But, on the other hand, we cannot permit them to be placed below their undoubted merits, of which Mr. TIMOROUS seems to form a very incorrect estimate. JOHNSON defines a profession to be "a calling; vocation; known employment;" adding, "The term profession is particularly used of divinity, physic, and law." We should have thought that the definition of our great lexicographer might have satisfied our correspondent's scruples, and saved the poor gardeners from the scolding that he has administered. Mr. TIMOROUS is too intelligent a person not to see that JOHNSON's addition is unworthy his reputation; for if the term profession is to be limited to "divinity, physic, and law," what becomes of the professions of *arms, marine, engineering, architecture, painting, sculpture*, and others? and what of the *professorships* of such subjects, which professorships are created by law, and have as much legal force as a patent of nobility?

We submit therefore that the JOHNSONIAN definition requires amendment, and that it should have stood thus—"PROFESSION: any calling; vocation; known employment; to which taste or science is necessary as well as skill." This will be found to exclude all trades and mere menial or mechanical employments; and to include the many varieties of intellectual occupation. It will exclude the butler and the lady's-maid, the private soldier and the garden "practical," the parish clerk and the doctor's errand boy; but it will include the commissioned officer, the engineer, the architect, the sculptor, the painter, and the gardener properly so called. We do not anticipate any objection on the part of our correspondent to the introduction of all these vocations into the class of professions, except that of the gardener; and we trust that his prejudices as to this will in time be overcome. He should consider that, in all "professions," there are many degrees of talent, and yet that the examples of highest or lowest talent are equally recognised as belonging to such professions. Will Mr. TIMOROUS say that a legally recognised apothecary does not belong to the profession of physic because he happens to be particularly stupid, or dirty, or ignorant, or otherwise disreputable; or that, because such a man is stupid, dirty, or ignorant, therefore the vocation of physic is not a profession at all? We think not; and therefore we object to his excluding gardening from the professions, for no better reason than because some gardeners have no title to belong to one. He evidently forgets that men are not necessarily what they call themselves; that a man is not a physician because he calls himself one, any more than a man is a gardener because he assumes that name. There are quack doctors and there are quack gardeners. Men practise physic, although their education was that of a pounder of drugs; men practise gardening although they know no more than a bricklayer's labourer. But, surely, it is unjust to take such cases as indications of the general *status* of the callings to which they respectively belong.

We are aware that, by the common law, a head gardener who lives in a house, furnished him by his master, on the grounds, has men under him, and receives a yearly wage, is a "menial" servant, and is liable to be dismissed at a month's notice, or on payment of a month's wages. But we do not think that important to the question at issue. The condition of mankind changes much faster than statute law. Surgeons were once accounted barbers; but will it be therefore said that our BRODIES and LAWRENCES rank with hair-dressers? In the days of ELIZABETH players were rogues and vagabonds; can it be contended that SHAKSPEARE then, or YOUNG and KEMBLE since, were rogues and vagabonds? The legal condition of men in one century can be no rule to determine their social position in an another century, because an old statute is unrepealed. In the reign of CHARLES II. a clergyman was a menial, living with grooms and serving-men; a waiting-woman was good enough for his wife. Will TIMOROUS contend that such is his station now?

We have no hesitation in asserting that numerous gardeners are to be found who, in all that is essential to sound education, are, we do not say equal, but superior to numberless individuals belonging to what Mr. TIMOROUS will admit to be professions. We have had in our hands gardeners' examination papers which would have stood high among those of the best medical students. Our own columns bear constant witness to the education, knowledge, and great social value of numerous gardeners in all parts of the country; and we cannot quietly allow such men to be classed among ploughmen, bricklayers, footmen, or even Mr. TIMOROUS's favourite *artistes*. It is true that for many reasons the standing of gardeners is not high in society, and probably never can be; but that is no reason why they should be swamped among the crowd that inhabit the cellars of our huge social edifice. Why, professions themselves stand in different relations to each other in our own tables of precedence. First comes Divinity, in the person of the Archbishop of CANTERBURY, next Law, represented by the Lord CHANCELLOR, and then at a wide interval military men and medical men, the latter ranking lowest. If it then be alleged that gardening is not a profession, because it is lower than arms or medicine, by the same reasoning it must be asserted that arms or medicine are not professions, because they rank lower than divinity or law.

We may seem to have given this matter more space than it deserves; for after all, it signifies little whether a man is said to follow a profession or a calling. The question has, however, been forced upon us, and we answer the challenge; the more readily, too, because it appears to us to involve the very important question whether a gardener is to be a well educated person or a machine. For ourselves we entertain no doubt that the interests and comfort of the higher classes, the employers of gardeners, demand that he should be the former, and that the views of our correspondent could have no other effect than that of throwing our gardeners back to the state in which they were under the STUARTS.

So many communications still reach us concerning the Winchester glass case, and so much anxiety seems to be felt by those about to employ ROUGH PLATE GLASS in their gardens in the ensuing summer, lest they should become the victims of imposition, that we are tempted once more to revert to a subject which is certainly one of the most important among the horticultural questions of the day. How, says "VITREA," am I to know whether the article I buy is what I intend to have, when I find a learned arbitrator declaring that blown unpolished sheet glass is legally substitutable for the rough plate which you so strongly recommend. If the Winchester justices, with the county funds at command, failed to secure a rational award, what is to befal a country clergyman if he finds his glazier cheating him?

That the award made at Winchester was thoroughly bad, is, we think, undeniable. The arbitrator allowed himself to be swayed by an obsolete use of language, and was, to all appearance, very little acquainted with the subject upon which he gave his decision. Such an example is not likely to be followed; but in case litigation should again arise, it is as well that unlucky buyers should be aware of the following important facts, which are capable of easy substantiation.

Excise duties were first levied on glass in 1695, they were reduced one half in 1696, and in 1700 repealed; in these Acts of Parliament the term "glass wares," was employed. In 1746 they were again imposed, crown, plate, flint, and all other *white* glass being classed together at *one rate of duty*, and *green* glass at another rate; this was previous to the manufacture of cast plate.

It is requisite to bear in mind that when the duty was imposed in 1746 there were two descriptions of glass made on the cylinder principle, denominated respectively *white* or plate glass and *green* or broad glass, corresponding with the white and green sheet glass on the Continent in the present day, the difference between the two in both cases being in the *material* only; in this country the green is no longer manufactured, being too inferior for the English market.

In 1773 the manufacture of cast plate was first established, and in 1775 an act was passed to separate it from crown glass, and charge it a higher rate of duty.

The effect of the introduction of cast plate was gradually to supersede blown plate, and the manufacture became well nigh extinct. It was, however, revived for a few years to a considerable extent *under somewhat peculiar circumstances* which *necessitated a continuance* of the term "blown-plate."

The duties on all white or plate glass, however made, were charged at so much per cent. on the material employed, but on all glass exported the duty was returned—this was fixed in the firs[t]

instance at 6*s*. 6*d*. per foot, on the assumption that it would be *equivalent to the amount paid*. It was at last discovered that, by the blowing process, a large premium might be realised; this was done to a considerable extent by Messrs. COOKSON and Co., who made "blown plate" from 1814 to 1817 expressly for that purpose, and realised in premium above 70,000*l*., hence the resuscitation of blown plate, and the necessity of continuing the same name. (See evidence of Mr. HETHERINGTON, 13th Report of the Commission of Excise Enquiry, page 90.)

When this system was arrested by an Act of Parliament, the manufacture of blown plate again became extinct and the term obsolete, notwithstanding that *all glass above one-eighth* of an inch thick WAS IN LAW PLATE GLASS, and the *legal definition* of crown glass, above that thickness, was "*blown plate*." See, as to this, the evidence of Mr. CHANCE, page 133, in which, in reference to this very matter, "blown plate" is called *sheet glass*, which in effect it was; but being called "blown plate" by Act of Parliament, the manufacturer of course, in his tariff and elsewhere, applied the same term, in order to be entitled to 6*s*. 6*d*. per foot, although he had paid only 3*s*. A case somewhat analogous to the one in queston occurred shortly before the repeal of the duties. Mr. HARTLEY, the great glass manufacturer of Sunderland, commenced making "broad glass," which paid a lower rate of duty than sheet, although made on the same principle; there were, however, certain conditions necessary to be attended to in the manufacture, to entitle it to the privilege of broad glass, which conditions were intended to deteriorate the quality. Mr. HARTLEY, although complying with these conditions, so improved the quality, that the manufacturers called upon the Excise to charge it with the sheet glass duty, because it was essentially the same article, and would be considered such by them, *irrespective of any tariff or Act of Parliament*; and on the ground that the article was essentially sheet glass, notwithstanding its trade or legal name, an Act of Parliament was passed expressly to subject it to the same rate of duty as sheet glass. The terms broad or spread immediately became obsolete, and merged into sheet.

From the foregoing statement, it must be evident, that a term employed in an Act of Parliament a century ago, or a tariff printed under the peculiar circumstances noticed, may justify a glass dealer in declaring that sheet glass is plate glass, but can be of no value or authority whatever in defining the meaning of a term in an architect's specification in 1849. As we stated on a former occasion, the point is not what was formerly made, or what an article was once called in this country, but what is the description of glass commonly and generally known as "*rough plate, $\frac{1}{4}$ inch*" thick, in the year 1849. To assert that what has been called "blown plate," in its unpolished state, answers this description, is absurd. *A certain thickness being specified, stamps it at once as having been cast plate*, in the meaning of those who draw builders' specifications.

Provided with this information, buyers have no real grounds for fear. If, however, they still dread misconception, or legal disputes, they may easily avoid them by insisting upon rough *cast* glass; one-eighth of an inch is thickness enough: beyond that thickness an additional price is necessarily charged by the maker; and it is paid by the consumer either for the sake of appearance, or against a risk from hail such as seldom falls in England.

There can be no question now that rough plate glass is the most beautiful, as well as the most useful, kind of glass that can be employed in horticulture. It is free from all the faults of sheet or transparent glass, and it has many advantages peculiar to itself, without a single disadvantage as a set-off. People say, indeed, that it transmits less light than smooth glass. Upon this point a friend has furnished us with the following statement:

"The ordinary photometric methods being inapplicable to determine the point you required, I employed one which limited the repetition of the experiments greatly, as it required a fine sunshiny day, of which we had few in the earlier part of last summer, and during the set-in fine weather I was in Germany. The method I adopted, and which is a very simple one, was this: I brought a small table into the open air and covered it with white paper; I then took the two plates (common sheet and HARTLEY'S rough plate) you furnished me with, one of smooth the other of rough glass, and placed them side by side in the same plane, but so inclined to the surface of the table that the direct rays of the sun fell perpendicularly upon them. Two adjacent shadows were thus thrown on the paper, and it was very obvious that the shadow of the rough glass was much darker than that of the smooth glass. Now we know from established experiments that the quantity of light reflected from the surface of smooth glass increases (and consequently the quantity of light transmitted decreases) with the obliquity of the incidence, and the law of this increase is known. I therefore changed the inclination of the smooth sheet glass until the shadows became sensibly equal, and, calculating from the angle at which this effect took place, I ascertained that the rough glass transmitted, *at perpendicular incidence*, about one-fifth less light than the smooth sheet. It is necessary, however, to bear in mind that the rough is considerably thicker than the sheet glass, and consequently more is lost by absorption in the former. At more oblique incidences the difference of effect is not so great, and at very oblique incidences the shadows are sensibly equal. It is impossible to repeat the experiments during the present weather, but when the sunshine again appears, I will re-ascertain the numerical results, having mislaid those of the former observations."

The glass used in this experiment was good 16 oz. sheet glass, and some rough horticultural plate supplied by Mr. HARTLEY, very inferior to what he is now manufacturing. It is true that *some* light is lost; but the beautiful condition of the plants beneath it prove that such a diminution is of no importance to the healthy condition of vegetation.

FAMILIAR BOTANY.

THE CHRISTMAS ROSE.

Still as the day upon the dark world creeps,
One blossom forth after another peeps,
Till the small flower, whose root is now unbound,
Got from the frosty prison of the ground,
Spreading the leaves unto the powerful noon,
Deck'd in fresh colours, smiles upon the sun.

WHO would suspect that modest drooping flower, which rivals the snow that surrounds it in the purity of its whiteness, to be one of the most virulent of vegetable poisons, and to have been employed for crimes which the historian almost shrinks from recording? The gardener only knows it as a broad green-leaved perennial, which produces, in the open ground, shortly after Christmas, its large white blossoms, at a time when all things else are bound in ice. The physician looks further, and pointing to its dark brown contorted knotty roots, warns the incautious workman against even permitting them to touch a wounded hand; adding that although sometimes used as a medicine by skilful men, it is extremely acrid, and in ignorant hands leads to almost certain death. The warning is needed the more because country quacks are too apt to prescribe it.

The natural abode of the plant is by hill sides, and in moist woods, in many parts of Europe, especially in France, Germany, and Italy. Botanists call it the Black Hellebore (*Helleborus niger*), but gardeners prefer its more familar name. The white attire which gives its wintry charm is derived from the calyx, not the corolla, as many think; the latter appearing in the form of sundry tube-shaped bodies, placed on the outside of the stamens, and dropping off, together with them, long before the calyx dies. This part, however, after a time, changes its colour, grows larger and larger, and at last acquires altogether the appearance of five green veiny leaves; which in that state serve as guards to the seed vessel, hanging over it like a roof, and keeping off the rain. It was in allusion to this peculiarity that Darwin spoke thus of the Christmas Rose in his fantastic poetry:

Bright as the silvery plume, or pearly shell,
The snow-white Rose, or Lily's virgin bell,
The fair HELLEBORAS attractive shone.——
—Erewhile how changed! in dim suffusion lies
The glance divine, that lightened in her eyes.——
Each roseate feature fades to livid green;
Disgust with face averted shuts the scene.

"This curious metamorphose," says the poet, "seems to show that the white juices of the corol (calyx) were before carried to the nectaries (petals) for the purpose of producing honey; because when these nectaries fall off, no more of the white juice is secreted in the corol, but it becomes green and degenerates into a calyx," which is something like saying that when a man's limbs become emaciated and shrunken from disease or old age they degenerate into tails. The simple fact is, that when the floral leaves of the Christmas Rose are young they are colourless, being filled with a watery sap and air, as is the case with similar parts in other plants; if they fall off early there would be no more change in this respect than there is in the blossom of a Cherry; but in the Christmas Rose the floral leaves do not fall off; on the contrary they go on growing for many weeks, and then, like all other leaves, under the continued action of light and air, secrete in their interior the same green substance as the ordinary foliage of the stem. It is exactly what happens also with the fruit, which is always colourless (white) in its infancy.

It must be admitted that the Christmas Rose is one of the most interesting of our garden plants, capable of enduring any degree of cold known in England, and blooming profusely when other things are torpid. All that it requires is shade and a damp loose soil, into which air can freely penetrate, and from which water can instantly drain. It abhors alike dryness and constant wetness. The side of a wet ditch is a favourite spot, but it must be only occasionally overflowed—for if the water collects about its roots, without running off, it becomes unhealthy, and obstinately refuses to flower. *R. E.*

PEAS.

THE Peas in cultivation are to be distinguished into the following classes.

A. Peas with a tough lining to the pod—Peas only eaten.

B. Peas without a tough lining to the pod—Peas and pods both eaten.

CLASS A.—Here the following distinctions are to be observed:

I. PEAS, WHITE.
- § 1. Tall sorts, requiring sticks.
- § 2. Dwarf sorts.

II. PEAS, BLUE, GREEN, OR LIGHT OLIVE.
- § 3. Tall sorts.
- § 4. Dwarf sorts.

III. PEAS, WRINKLED, OR INDENTED WHEN DRY.
- § 5. Tall sorts.
- § 6. Dwarf sorts.

I. PEAS WHITE.—§ 1. Tall sorts.

1. *Early Frame*, alias Early Single Blossomed, Early Double Blossomed Frame, Best Early, Early Dwarf Frame, Single Frame, Perkins's Early Frame, Early One-eyed, Superfine Early, Young's very Early, Batt's Early Dwarf Nimble, Russell's Fine Early, Early Wilson, Early Nicholas, Early Nana, Early French, Mason's Double Blossomed, Dwarf Albany, Early Warwick, Early Race-horse, Pois le plus Hâtif, Vert à rames de Mont Julienne, Michaux de Hollande, Pois Baron, Pois Laurent. About 4 feet high, rather slender; pods small, round, mostly containing five or six Peas; well known to be one of the earliest. It does not stand the winter so well as the Charlton.

2. *Prince Albert*, about 3 feet high; a variety of the preceding, ripening about 10 days earlier. The Early Kent is very similar to this, as is likewise Warner's Early Emperor.

3. *Early Charlton*, alias Golden Charlton, Early Sugar Frame, Late Dwarf, Twesly Dwarf, Hotspur, Wrench's Hotspur, Double Dwarf Hotspur, Early Hotspur, Golden Hotspur, Common Hotspur, Early Nicholas Hotspur, Nimble Taylor, Paddington, Essex Reading, Russell's Early Blossomed, Michaux, Michaux ordinaire, Michaux précoce, De Ruelle, Petit Pois de Paris, Dominé. About 5 feet high; may be distinguished from the Early Frame by its larger pods, which, instead of being round are broad, containing six or seven peas. It is the best Pea for standing the winter, but it is about a week or ten days later than the Early Frame. The Eastern Shore and Tall Frame are varieties allied to this, but inferior.

4. *D'Auvergne*, about 5 feet high; pods very long, nearly round, curved at the end, very full, containing sometimes 11 peas. A very productive and excellent sort, about 10 days later than the Early Charlton.

5. *Early Hero*. Ripens about the same time as the preceding; about 5 feet high; pods slightly curved, a little flattened, containing 6—7 medium-sized peas, of good quality; a good bearer. Lady's Finger, or Doigt de Dame, has long cylindrical pods; but does not bear so abundantly as some others. Shilling's Grotto fills badly, therefore neither of these require further notice.

6. *Tall White Marrow*, called also the Large Imperial Marrow, Tall Carolina, Large Carolina, New Tall Temple, Clive, Wooten, White Rouncival, Princesse, De Marly, Suisse. About 7 feet high, of strong growth; pods large, very broad, containing 8—9 Peas, of excellent quality; a good, prolific late sort. The Egg, called also Large Egg or Bean, and Patagonian, closely resembles the preceding; and to the same sort the Pearl or Nonsuch has considerable affinity; but these sorts are, on the whole, inferior to the Tall White Marrow.

7. *Dancer's Monastery*; 6 or 7 feet high, bearing a succession of very large pods, containing 7 or 8 large Peas of good quality; a sort of Marrow, earlier than the Tall White Marrow. It has doubtless been recently sold under some other name. Not worth distinction are the following: *Crown Pea*.—American Crown, Rose or Crown, Turc, Couronné, Turc à fleurs blanches, Pâquet; 5—6 feet high, of strong growth, with the blossoms in bouquets, or like a crown at top; and it is more remarkable for this pecu-

liarity than for any useful property. *Branching Marrow*—Donn's New, Prolific Isle of France, 5—6 feet high; pods large, nearly round, containing 8—9 Peas; late. *De Guivergny;* intermediate between the Dwarf and Tall White Marrow; but possesses no superior merit.

I. Peas white.—§ 2. Dwarf sorts.

8. *Early Dwarf*, alias Nain hâtif, or Lévégue, 1½ to 2 feet high; pods small, rather broad, mostly containing five Peas, very prolific, and of good quality; proper for growing under glass, in which case the tops should be pinched off. It flowers as low as the second or third joint. The Common Spanish Dwarf, called also Early Spanish Dwarf or Fan, Dwarf Bog, Knox's Dwarf; and Bishop's Dwarf, which sorts resemble each other, are inferior to the Early Dwarf, and must now be considered as entirely superseded by

9. *Bishop's New Long-pod*, about 2 feet high, pods nearly straight, almost cylindrical, containing six or seven Peas. An excellent prolific early dwarf Pea. Thompson's Early Dwarf is, like this, dwarf, early, and prolific in pods, but these contain fewer Peas; it is consequently not worth growing.

10. *Dwarf Brittany*, or Nain de Bretagne, Très nain de Bretagne, Très nain de Brest. The dwarfest known, its height being only 5 to 8 inches; pods small, nearly round; may be sometimes useful for late sowing, otherwise a mere curiosity. [The Large Spanish Dwarf belongs to this section, but being an indifferent bearer, it is no longer deserving of record; nor, in comparison with Bishop's New Long-pod, can the Dwarf Branching Marrow, which is the same as Grimstone's much-puffed Egyptian Pea, be deemed worthy of cultivation. The same may be said of the Queen of Dwarfs. As for the *Dwarf White Marrow*, alias Glory of England, Wabash, Hâtif à la Moelle d'Angleterre, Hâtif à la Moelle d'Espagne, Sanspareil, it is of excellent quality, but not prolific.]

11. *White Prussian*, or Dwarf White Prussian, Prolific or Poor Man's Profit, Prolific, Royal Prolific, Royal Dwarf, Dwarf Twesley, Stowe Pea. About 4 feet high; pods broad, long, and rather flat, containing 7 or 8 large Peas; an excellent prolific summer Pea, but will not remain so long in bearing as the Blue Prussian. *R. T.*

THE BOTANIC GARDEN, SIDNEY.

We have great pleasure in extracting from the *Sidney Herald* the following portions of a report upon the present condition of the public garden there. It will be highly satisfactory to Mr. C. Moore's friends to know that he is pursuing a career of much public usefulness, and we should hope that the legislative council will perceive that the unintentional displacement of Mr. Bidwill by Mr. Moore's appointment, has resulted in the acquisition of a valuable public officer.

Extracts from a Report by the Director of the Botanic Garden, Sidney, dated Jan. 18, 1849: "On entering upon my duties as director, in February last, I found that in consequence of a considerable diminution of labour, the garden was necessarily in bad condition, the borders were overgrown with weeds, and the walks out of repair; the arbour was broken down, from the natural decay of the wood forming the supports and trellis-work; the terrace walk in the lower garden, and the salt-water pond which terminates it on the west side, were in a very unfinished state. Upon such labours as were required to effect the necessary repairs, to supply the borders with showy, free-flowering plants, and to make new plantations of ornamental trees, I have been chiefly employed during the past year. The decayed arbour has been removed, and the frame-work of a new one erected; nearly all the walks in the upper garden have been broken up and covered with fresh gravel; 600 yards of new walk, 9 feet wide, in the lower garden, have been completed, upon which upwards of 900 cart loads of gravel were used; 300 cart loads of stone brought from the Old Government House and elsewhere, have been used in the erection of 200 yards of sea-wall, forming a continuation of the terrace walk around the garden cove and the salt-water pond adjoining. With a desire of carrying out the views of the Government, and of rendering the garden a school of botany and horticulture, I have prepared a catalogue, by means of which I shall be enabled to arrange and classify the present collection of plants. I have remodelled the western portion of the lower garden, for the purpose of illustrating the natural orders included in the class 'Monochlamydeæ.' And on the same side of the upper garden, a large plot of ground has been cleared and well trenched for a collection of such plants as are used in the arts, manufactures, medicine, and for domestic purposes; this will form, for the present, a nursery, from which seeds and plants of this description may be distributed. In a portion of this ground, a fresh plantation of Cotton has been completed, and up to the present is flourishing. A great demand has been made for Cotton seed, principally by persons residing in the Hunter River district, and that collected during the last season has already been distributed. The labels which have been attached to the plants in the garden, showing the natural order, scientific name and authority, English name and native country of each plant, appear to have given very general satisfaction; but no funds having been provided during the last year to cover the expense of printing, this system has not been carried out to any great extent. As, however, ample means are now at my disposal, I have made arrangements for naming one plant of each species. The various seeds which were collected during the last season have been principally distributed to persons returning to Europe, under an agreement that some equitable return should be made in kind; and collections both of seeds and specimens have been given to several medical superintendents of emigrant vessels for presentation to public institutions in the mother country. The small demand for Vine cuttings, in consequence of their very general distribution in the colony, has induced me to destroy many duplicates; it will, however, be my endeavour to ascertain the best varieties, which might be set apart and retained, whilst those of inferior quality might, without disadvantage, be destroyed. The regulations which I felt it my duty to recommend, and which were at once sanctioned by his Excellency the Governor and the committee of management, have had the desired effect of preserving order and decorum, without in any way interfering with the liberty of the persons visiting the garden. By a rigid enforcement of the rules, the character of the garden has been raised sufficiently in the estimation of the public to give an assurance that within its limits all the privacy and retirement of a rural walk may now be enjoyed without fear of interruption by rude and disorderly persons."

(Signed) *Chas. Moore.*

Nevertheless, in the face of these facts, we find a Mr. Cooper and a Mr. Donaldson striving with all their little might, in the Legislative Council, to put the Garden down: for such would be the effect of their measures, if adopted. We are, however, happy to add, that these gentlemen enjoyed the unenviable satisfaction of standing alone in their Vandalism.

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

(*Continued from p.* 37.)

On leaving the lake we diverge to the left by a walk which leads to the poultry-yard. Each side of this walk is lined with four rows of plants. The front row consists of Juniperus sinensis; the second of Thuja Wareana, 10 feet high; the third of Thuja orientalis, 12 feet high; and the fourth, of noble specimens of Pinus Cembra helvetica. The poultry-yard itself is surrounded by a wall covered with Magnolia grandiflora (the Exmouth variety), intermixed with Jasminum officinale, presenting a noble appearance. On the outside of these walls, where shelter is required, are lines of Deodars, Hemlock Spruce, Pinus Laricio, and Douglas Firs; on the side where protection is not required are files of the Chinese Juniper and Red Cedar.

The poultry-yard is comprised within a spacious quadrangle, fitted up with every necessary requirement for breeding and feeding all kinds of fowls. It contains turkey houses, duck houses, roosting houses, pigeon houses, together with numerous laying houses, all warmed with hot-water pipes. The yard in front of the buildings is divided into compartments by means of wire fencing, and for perfect security is also covered with the same material. In the middle of the yard is a spacious duck pond, out of whose centre rises a huge pile of rocks surrounded at the base with Irish Yews, and on the top there is a beautiful Abies Douglasii. A private way, having on either side a variegated Holly hedge 10 feet high, leads from the poultry-yard to the stables. On the west side of the poultry is a plantation several acres in extent, bounded by a green Holly hedge 10 feet high. The object of this plantation is to shelter the poultry-yard and the west wing of the Pinetum. It consists of rows of Pinus Cembra helvetica, P. austriaca, P. Laricio, and Picea pectinata. The end of this plantation brings us again into the circle of approach roads by the second grand entrance, where we take the direction of the Lime-walk. This walk has a double row of Limes on either side, 90 feet high. They are planted at some distance from the walk, and in front of them are arranged in groups every variety of Holly that could be obtained, the whole ending in variegated Hollies alone. The walk itself is margined with common Yew, kept dwarf. Emerging from the Lime-walk we enter a wood of common Yew, all of whose tops are grafted with thousands of the Gold Yew, producing, as may be imagined, a rich effect. The circle of approach is then continued with the Cedar of Lebanon in the background, all, however, being grafted with the Deodar. In front are arranged, for some distance, Irish Yews, Savin, and hardy Heaths, until we reach a part carpeted entirely on both sides with the fine variety of Gold Holly, the effect of which is rich beyond description. This peculiar plan of decoration terminates in the castle, and nothing could be more appropriate, surrounded as it is on all sides with plants singular for their expressiveness either of colour or form.

Leaving the castle in the rear, we kept on in an opposite direction, through beautiful variegated Gold Hollies as before, and entered the "Bedford Drive," so named in compliment to his lordship's brother-in-law, the late Duke of Bedford. The gravel road is 15 feet wide and 1½ mile long, maintaining in every respect the high character of the grounds already described. We proceeded first through variegated Holly hedges 12 feet high, dressed in the form of walls; these are succeeded by Portugal Laurel hedges of similar character, the object being to screen the grounds in the immediate vicinity of the mansion. We then emerge into a plantation planted right and left with Pinus excelsa, P. Laricio, P. austriaca, P. Cembra helvetica, and Hemlock Spruce. As far as these extend the edging on both sides is composed of Box 2 feet high and 2 feet across, cut square. The following evergreens, ranged in three lines on each side, then succeed these: Juniperus hibernica, J. sinensis, Cupressus thyoides variegata, and Thuja orientalis, variegated effectively, so as to produce a singular contrast. We here cross a narrow part of the American garden, which is partially concealed, pursue our course over the lake by a rustic bridge, and turning to the right have a beautiful view of Spondon church; on the left an avenue of Irish Yews, which terminates with an immense cross raised on an antique pedestal. The Drive here presents an uninterrupted line of straight avenue of 300 yards, margined on either side with Aucuba japonica, supported by a pyramidal variety of Thuja orientalis, 10 to 14 feet high, in rows, producing an extremely grand effect. The plantation behind is of great depth, and is composed of valuable Conifers. The edging at the termination of this straight line is varied with Pyrus japonica, and is then continued with green Box, all 2 feet high, shorn close and square, for at least a mile unbroken. In pursuing this portion of the Drive, the red Cedar takes the place of the Chinese Arbor-Vitæ, and then again we have the Irish Juniper, backed for some distance with Laurustinus. At the centre of the Drive, three-quarters of a mile from the castle in either direction, is what is termed "The Rest," which is surrounded by Portugal Laurel hedges, as are also the entrances to it. In the centre of the Rest is a large circle, containing a splendid Deodar. This circle is divided into four segments by means of Yew hedges. There are also in each four recesses with Yew hedges, supported on each side with Irish Junipers in files. At the end of each division is a small circle raised in the form of a mound, on which are planted Cryptomeria japonica; each of the angles constituting the four compartments is filled with Chinese Junipers, and flanked with Irish Yews.

Resuming the Bedford Drive: for a quarter of a mile variegated Hollies decorate both sides of the way, with Abies Douglasii in the background. The Hollies are from 10 to 16 feet high, and there are many hundreds of them, all of which were transplanted last year, but they exhibit little indication of having been so recently removed, and only a solitary plant was lost through the effects of the operation. At this part of the Drive we reach the "Leinster Walk," leading to the east avenue. On entering this walk, the turf is ornamented with low Portugal Laurel hedges, delineating geometrical scrolls. These hedges are all trimmed quite close and smooth; on each side are fine specimens of Cupressus Uhdeana, 8 feet high. Passing to the east avenue, are high Portugal Laurel hedges; at the termination here the walks cross at right angles, with gravel recesses. Fronting this is an angle with a green raised terrace, on which are arranged Juniperus hibernica, representing minarets, with scrolled figures of Box adjoining, cut and shorn close, 2 feet high, and 5 feet across the top. As we pass along the Leinster Walk, the east avenue is completely hid by large evergreen hedges, which also obscure any appearance of walks from the avenues. This walk takes a turn, and, crossing the Bedford Drive, leads to the kitchen garden, which is not visible from any walk or Drive until we reach the gate, everything being so admirably planned and planted. *R. G.*

(*To be continued.*)

DISEASES OF PLANTS.

(*Continued from p.* 38.)

Genus XI. Yellowness, or Icteritia.—Plants are sometimes liable to lose the beautiful green which clothes them, and to assume a yellow colour more or less deep. The leaves are, more than any other part of the plant, subject to this disease, which is for the most part accompanied by a stopped or more or less retarded perspiration. This is especially the case with trees, herbs usually turn yellow all over. This disease arises from causes totally the reverse of each other. A plant suddenly exposed to much light, when it had previously had no more than what was necessary for vegetation, more especially if it be of those which, growing naturally in the shade, do not require much light, will from this cause alone contract the yellowness. The extreme abundance of summer heat stimulating the plant to excess, and promoting a greater perspiration than that which is natural to the plant, may make it turn yellow; most frequent instances of this may be observed in the fields as well as in gardens. On the contrary, a sudden cold coming on at a time when the plant is most in want of heat, as well as any sudden abstraction of the aliment necessary for its prosperity, or a deterioration in its quality, will bring on the same disease. Thus trees planted in stiff soils which retain too much wet, or those in loose soils, without sufficient nutriment, turn yellow. The *Icteritia*, or *yellowness*, generally brings on other evils whose consequences are fatal, such as ulcers, which not unfrequently lead to death. Some plantations suffer from yellowness almost every year, from the circumstances under which they are placed. From these considerations several species of yellowness might be distinguished, according to the periods at which they come on. I shall confine myself, however, to two only.

First species. Accidental Yellowness. — This malady, as it appears to me, is always attributable to irregularity in the seasons, a sudden excess of heat or unseasonable cold. Such yellowness is often productive of much mischief. We generally suppose it to be confined to the foliage of trees, but if we carefully observe the various plants which cover the face of our fields, and look at those places where Nature has been most lavish of her vegetable riches, we shall there find the greatest injury caused by it, injury by so much the

greater as there is no help for it. It may, indeed, happen that where excess of heat has caused the yellowness, it may be partially remedied where there are means of irrigation, but such benefit can only be felt by a few individuals among herbaceous plants; and where cold has been the cause of the evil, there is no remedy.

Second species. PERIODICAL YELLOWNESS, so called from its attacking vegetables at stated seasons, on the recurrence of the same causes, often attributable to the cultivator's negligence. Plants growing in compact soils, with a substratum of stone or other substance impermeable to water, which consequently always lies about the roots; those which are placed in poor soils will regularly turn yellow every year. If long neglected, this disease will cause the plants to perish. It may, however, be prevented. Draining off the stagnant waters is of the first importance. Some think they can put a stop to the evil by copiously manuring stiff soils, but they frequently err in the choice of manure. Stable dung by itself must in these cases be put aside, and the preference given to the scrapings and sweepings of roads, yards, and waste places about manufactories and workshops. All sorts of coarse refuse containing miscellaneous substances from the three kingdoms are good, as, producing a slow and long continued fermentation, they evolve a considerable quantity of caloric, which assists materially in correcting the stiffness of the soil. Attention must, however, be paid to allowing its fermentation to have continued some time before they are applied, and not to lay them on the soil during great droughts.

VILLA AND SUBURBAN GARDENING.

WHEN the Vine is placed under artificial treatment, with a view to its early production of fruit, the natural atmosphere should in some measure guide our proceedings. Begin growth quickly, and heighten the temperature progressively with increasing sun light. The great error into which the uninitiated in forcing Grape Vines, and indeed anything else, fall, is that of neglecting to observe the laws which give impulse to vegetable life; they create mid-summer at mid-winter, and produce a mid-day temperature at midnight. These unnatural conditions must, as far as is consistent with the object aimed at, be avoided. If the weather is cloudy and cold, moderate the temperature; if fine, with bright sunshine, increase the stimulus. Night brings repose to vegetable as well as to animal life, and this fact ought to warn cultivators against roasting and steaming their plants at night; they should rather save their coals. I remember, when a lad, that in early forcing the grand point aimed at was the production of a high night temperature, and, in order to see that this was enforced, the hothouses were visited regularly by the head gardener at 10 o'clock at night. The stove doors by that time were red hot, the flues—for hot water was then unknown—were nearly in a similar condition, and water was copiously poured over them for half an hour, until the house was a complete vapour bath, sweating with moisture, and the thermometer at 80°. Such a state of things, we need hardly add, was both unnatural and unphilosophical. Had this heating and steaming commenced with the light of morning, these operations would not only have been more in accordance with nature, and more beneficial in their results, but they would have been practised at much less cost.

A night temperature of from 45° to 55° in spring, according to the state of the weather, will be found ample, even for a very early crop; a higher heat is attended with risk, and will not, under otherwise proper management, at all facilitate the ripening of the crop. The day temperature is quite another thing. Kindle the fire the first thing in the morning, and increase the humidity of the atmosphere by syringing or otherwise. Give a little ventilation as the day advances. A sun temperature of 80° or 100° will do no harm at some seasons, and less always than a few extra degrees put on by means of firing. Instead therefore of giving a table indicating the weekly or monthly temperature at which such houses should be kept, it is better to lay down general principles, leaving the amateur to use his own judgment and discretion, the proper exercise of which will supersede all tabular instructions, and will create a deeper interest in the object of his pursuit. *Pharo.*

Home Correspondence.

The Gardener, his proper position; a word or two thereon.—The observer of men and things—the man who extends his investigations beyond the immediate circle of his everyday occupations, whatever they may be, needs no reminding that there exists in every community, in every little circle that comprises the great aggregate of society, individuals who without one claim upon distinction, without any praiseworthy characteristic, would arrogate superior attainments, would assume a false position, would cheat themselves and their neighbours into the belief that they were beings of no common order; and the means by which they endeavour to establish their claims to such distinctions are by dressing in the borrowed plumes of their ancestors, or deprecating the merits of those immediately surrounding them. That such characters are to a degree mean and selfish, I need not stop to illustrate. They are the plague-spot of humanity, the great stumbling-blocks to social and mental progress, alike unworthy as men, as friends, as members of society. They, possessing no merit themselves, are unable to appreciate it in others. They cannot, or will not, recognise worthiness of character, except by association. The struggles of unaided genius, the "pursuit of knowledge under difficulties," however noble the object to be gained, excites no sympathy with them. In a word they belong to that class whose sentiments are immortalised—immortalised by their sheer ridiculousness—in the well-known couplet of a noble author, in which everything mentally, everything socially great is as nothing in the scale against the pride of birth. How much of the character I have attempted to sketch is appropriated by "Elpidophorus" I will leave him to decide. Certain it is he cannot distinguish between those simple mechanical labours which require no forethought or anxiety, and the results of the operations of the mind. He with one "fell swoop" classes the whole fraternity of gardeners, unless they are in business on their own account, under the general term "labourers." I consider "Elpidophorus" to have offered an irreparable insult to every respectable gardener who reads the pages of the *Chronicle*. By respectable I mean the man who with a competent knowledge of his PROFESSION, backed by an education—acquired, it may be in the main, by his own unaided perseverance—that will refine and elevate his tastes, combines a high integrity of purpose, a devotedness to his own self respect, and to the interest of those by whom he is employed. Such a man is unquestionably a servant, but is it respectful, is it common justice to call him a "hired menial?" If a person who performs some office for another, is a servant, and if a servant is a menial, then it is very probable that "Elpidophorus" belongs to that very numerous class. He must have but a very imperfect idea of the requirements of a gardener when he awards no more intellectuality to the principal of a large establishment, than to the man who merely sows his Peas, or digs the ground. I am not one who would wish to assume an importance which does not belong to my calling as a gardener. But I feel indignant in being spoken of in the spirit which "Elpidophorus" betrays in his letter. I had hoped the day was on the wane which judged of a man's intellectuality by the particular occupation to which he was attached, and felt a high gratification in the seeming fact that man reflected honour on his station rather than borrowed an importance from it. There are in every particular calling to which the intellect of man directs itself, individuals who are not only a disgrace to their fellows but a libel on humanity at large. In law, in physic, in divinity, there are abundant examples, as well as in the more humble "profession" of a gardener, or any other branch of human pursuit. But it is wrong, it is injustice in any case to stigmatise the whole for the delinquencies of a few, or the few for the misdeeds of the many. Every man who follows a "profession," has two characters at stake, the one relating to his calling, the other in his relation to society. For the gardener, as for every other person, I conceive the proper position to be in either case just what his moral, intellectual, or professional attainments entitle him to. Society will always find its level, and I rejoice that its constitution is such, that a legion of "Elpidophoruses" cannot debar a man from mixing with that society to which his attainments or tastes entitle him. I make no doubt that "Elpidophorus" is one of those gentlemen who at times figure in the advertising columns of the newspapers, wishing to engage a "gardener, without encumbrance, and who perfectly understands his business; wages 12*s.* per week. N.B., he will be required to wait at table occasionally, and to make himself generally useful." Comment in a case like this would be superfluous. *L. G.*

Hamburgh Grapes come from Spain and Portugal. What is the origin of the name? In the reign of Queen Anne, at the Methuen treaty with Portugal, 1703, my grandfather accompanied the Marquis of Pombal, as court agent and merchant. During the late wars my grandfather received what were called "assimilated papers," licenses of the French and other belligerent powers, for any vessel, from any country whatever, to introduce, unmolested, certain articles—for instance sugars, into France, where they had none. This was done only through the ports of Heligoland and Hamburgh, I believe. I need not say these papers fetched a high price. Vessels coming from Spain and Portugal took Grapes as well as sugars, which were afterwards shipped from thence to London, and I think the Grapes acquired the name of Hamburgh Grapes. Had that name of fowls a like origin? *E. D. Santos.*

The Pickaxe a good Implement for Stirring and Breaking up Frozen Soil.—The utility of exposing the soil to the pulverising influences of frost is generally recognised. What I have now to suggest is, the use of the pickaxe, or something similar, in breaking up the frozen soil that has been previously wrought with the spade. I was to-day quite astonished at the amount of work I could perform with it; I am confident that one man may do as much as other four with forks; but indeed the latter are at present quite useless here at such work. I am persuaded that if gardeners and others would give it a trial, they would at once find very remunerative employment for their men, now that the frost has again set in on the disappearance of the snow. *J. H., Salop, Jan* 21. [Try the pickfork.]

Coles' Superb Red Celery.—W. Cole begs to inform the public, as requested by W.'s letter (page 39) that the Solid Red Celery he now advertises is a plant selected from his stock six years ago; and judging from the number of testimonials he has received, of the unbounded satisfaction it has given, and from a prize being awarded him from the Horticultural Society for its being a new and superb article, thinks it unnecessary to say it is not the sort annually distributed by the Horticultural Society. [The *fact* is that on the 5th Dec., 1848, a certificate was given by the Horticultural Society for six heads of what was called Cole's Superb Red Solid Celery; *not for the sort*, upon which no opinion was given, but for the good cultivation it indicated. Our own belief is, that it is in no important respect, if in any respect, distinguishable from the Celeri violet, annually given away by the Horticultural Society.]

To drive away Rats.—My opinion is that if rats are poisoned in an aviary they will die in it, and cause a stench that will have a bad effect on the birds. If a ferret is applied for some time beneath the flooring the rats will decamp, for the very smell of a ferret will banish them. Where poison is employed, and rabbits cannot be easily got as bait, any kind of small fish will answer the same purpose, especially a salt herring. *John Pell.*——I was sorely troubled for several years with rats about and in my dwelling-house. I found that their main retreat and harbour was an unnecessarily large drain; this I caused to be filled up, and a small one, just sufficient for the purpose, to be laid as near the surface of the ground as could be, without being exposed; since then I have been quite free from them. I was told by a friend of a most effectual remedy. An acquaintance of his, a farmer, was so alarmingly beset by these destructive marauders, whose name was legion, that the usual aids of dogs, cats, ferrets, traps, &c., were unavailing; he was fairly put to his wit's end. He at length bethought him—lucky thought—that the most effectual way of dispersing an ungovernable mob or enemies of whatever kind, was to call in aid the red coats; so the next rat caught in a trap he enlisted or impressed into his service, had him *nolens volens* clothed securely in scarlet, and then let him loose; away he madly galloped, and dashed into the midst of the enemy—consternation seized upon the whole host *instanter*—the panic became general—helter skelter they went—he screaming and they too; the harder they ran the more he strove to keep up with them, so that at last it became "every one for himself, and a certain personage take the hindmost;" "in less than no time," or four-and-twenty hours, not an enemy was to be seen. *Ullswater, January* 23.

——"Mix one shilling's worth of Spanish flies in a bottle of the best French brandy; cork it well, and after shaking, deposit the bottle in smoking horse dung; let it remain six weeks and it will be fit for use." A few drops of this liquid is said to entice them from their holes into any kind of trap you choose to employ. I have not used the remedy myself, but it is well worth a trial. *A Subscriber.*

Pear Moths.—I have to thank Mr. Westwood for reminding me of his paper upon Tortrix angustiorana, written 12 years back. In referring to it I apprehend he has been too hasty in jumping at conclusions, for I am unable to reconcile his version of the economy of this moth with Mr. Graham's. Mr. Westwood's caterpillars lived upon the Apricot buds and leaves in May, Mr. Graham's inhabited the crowns of Pears in the winter; surely these cannot be the same; and so far from proving that the caterpillar does, it may fairly be inferred that it does not "pass the winter in the larva state, ready to commence its attack upon the young buds and leaves as soon as they are developed in the spring." It is very remarkable that of all the caterpillars I have reared during five years' residence at Hayes, with a garden fairly stocked with Pears, Apples, Plums, Peaches, and Apricots, I should never have bred the Tortrix angustiorana, from hundreds of larvæ which spin up in the spring-buds of those trees. I can rely upon Mr. Graham's accuracy, and I shall leave him to satisfy Mr. Westwood's doubts. I may however testify to the brown spots not being decayed when the Pears were given to me, and the webs were white, as I believe they always are, with the smaller moths. It is of little import, but Mr. Westwood speaks of my finding the moths "on the palings of the Regent's Park, adjoining the New-road;" such is not my statement, and it so happened that it was on the opposite side of the Park, under Primrose-hill, where there are gardens and fruit trees. I must also be permitted to satisfy your readers that Mr. Westwood quite misunderstood the purport of my article on Odymerus, the economy of which was sufficiently explained at the time, and well understood long before: but not so with regard to the sand wasps infesting bee-hives and rendering them disgusting to the fastidious bees; this was a new and interesting fact, and it is well known that bees will abandon their hives when any intruders take possession, if they cannot expel them. Possibly the sand-wasps in no other way injured the bees, as they store up caterpillars for their young, and I am not aware that they will purloin the honey, but they certainly have mouths which appear to be not inapplicable to such a purpose, and the males, at least, are well known to feed upon the farina of flowers. But there is still a third charge, of my ignorance regarding a minute Podura which infests Potato haulm. One reason why I did not call my species P. Caulastinus was, that Mr. Hardy's description and my insects did not agree in one particular. His Podura was apparently much larger than mine, the colour light yellow, and not deep ochreous; and his had six white spots behind the posterior legs, mine had none; moreover, many of my specimens were jet black, which he did not notice. With such discrepancies, it is a little surprising that any one at all conversant with specific differences should positively assert that P. Solani and P. Caulastinus are the same.

In my essays, both in the Journal of the Royal Agricultural Society and in the *Chronicle*, my object has been to lay before my readers new facts on good authority; and these should be fairly investigated, and not cavilled at, if knowledge is to be elicited and the public instructed. I may be excused for adding, that in 1842 the economy of Pemphredon or Cemonus unicolor was published in the above Journal, as well as three other insects, which store up the aphides as food for their larvæ. They will avail themselves of any tube open for their reception, and consequently the ends of straws on a thatched roof sometimes afford accommodation to very extensive families. *J. Curtis.* — Mr. Westwood, in last week's *Chronicle*, seems to think that no one, from reading the account of "Ruricola," can come to the conclusion that the larva of this moth feeds upon the Pear itself, or that it is naturally injurious to that fruit. This appears to me rather extraordinary, as "Ruricola" has so distinctly shown the extent to which the caterpillar has preyed on the rind in the portion of the Pear figured; in addition to which he states, in one place, "injurious as the caterpillar is to the Pear, I doubt not its history will interest pomologists;" and in another part he observes, "The injury which this caterpillar does to the finest sorts of keeping Pears renders it desirable to find a remedy," and immediately suggests the best one possible. But even if these statements were wanting, how could Mr. Westwood suppose the caterpillars could exist for three or four months, if not on the Pear, while enclosed in a glass tumbler? Surely this would not be in accordance with the "ordinary economy of insect life." In order to remove any doubt upon the subject, I beg to say the caterpillar does feed upon the rind of the Pear surrounding the calyx, into which convenient den he retires when his appetite is satisfied; and the method by which I bred the moth was by supplying the caterpillar with a fresh Pear as soon as he had produced decay upon the first on which I found him. If, therefore, any one besides Mr. Westwood has come to the conclusion that this caterpillar is not naturally injurious to the Pear, he has certainly formed a very erroneous one, which I trust these particulars will remove. Mr. Westwood is also wrong in supposing that this was merely an accidental adoption of winter quarters by the caterpillar, for I have found dozens of them in the same caves during the last three years. Yet Mr. Westwood scruples not to say that if this were the case, the habits of the insect must have been long since observed. Now were this trite argument infallible, not a few of Mr. Westwood's own original discoveries, including the last given in your Paper, might be set down as mere eccentricities, for the dead snags on a standard Rose tree are rather more prominent objects than the calyx of a Pear; yet in these snags Mr. Westwood has been able to "pick up facts in regard to four or five species of insects, the economy of which has hitherto remained unknown." The snag of a Rose tree may offer to Mr. Westwood "a mine of interesting observation," but the calyx of a Pear is not permitted to contain a single caterpillar for the observation of "Ruricola." Alas! "Ruricola!" into what errors hast thou not led me—who hast so often declared to me that the field of Nature is wide enough for us all, and that there are recesses in her magnificent cabinet which generations to come will fail to exhaust—who hast taught me that insects are led by an unerring instinct to feed on that which is most agreeable to their tastes and most suitable to their peculiar constitutions, and to take up their abodes in those places whence they can most readily supply their wants, and where they can rest most secure against their enemies. With the Odymerus I have nothing to do, but I have no doubt that "Ruricola" will be able to give a very satisfactory account of it. But with respect to the Smynthurus Solani, I must say a few words, as Mr. Westwood implies that Mr. Curtis borrowed his information of this insect from Mr. Hardy, who published an account of it in 1848. Now, Mr. Curtis, to my own knowledge, was acquainted with the insect at least two years before this; for I found it myself on the Potato in 1846, and sent him specimens of it; moreover, I subsequently gave a short description of it in the Journal of the Royal Agricultural Society for that year. It is, therefore, most probable that Mr. Hardy himself obtained his information of this insect from the above source, although I do not presume to say that he did; but it is quite certain that Mr. Curtis did not derive his knowledge from Mr. Hardy. I may add, that no author is more particular in citing authorities than Mr. Curtis, although it is matter of notoriety that very heavy contributions have been levied upon the stores contained in his unrivalled works, without the slightest acknowledgment. *F. J. Graham.*

Half-hardy Plants.—In your answers to correspondents (which by the way I must own you give with praiseworthy and unexampled patience), you speak of Limonia laureola as a fine thing, and ask, "Is it hardy? Tell us all about it." The reply to this inquiry I shall eagerly look for, as I have during the last year planted a small specimen of this species against an east wall, where it has borne the recent severe weather very well. Loudon tells us that it was raised in the garden of the Horticultural Society, from seeds sent by Dr. Royle, who found it on the tops of cold and lofty mountains in the Himalayas, where it is for some months buried under snow. Is it a fruit-bearing species, with fragrant blossoms? [No.] If so, it will be a truly valuable addition to our shrubberies. Many of my old favourites have thus far borne the intense cold with which we have been visited, though a few small seedling Acacias from New Zealand have lost their leaves, and Veronica speciosa has its young shoots injured, except where nailed close to the wall. I see, too, that many unripened twigs of Viburnum odoratissimum are damaged. I trust that the readers of the *Chronicle* will record their experience of the hardihood of any exotics, that others may benefit by it; for surely there must be numberless plants that will stand our climate, if a trial be afforded them; and probably the trial is making and has been made, unknown to any one but the experimentaliser. Pinus Hartwegii and Russelliana are unscathed with me, and Pinus Gordoniana, macrophylla, filifolia, and longifolia likely to succeed equally well, and the evergreen variety of Taxodium distichum. I want the names of a few good Coniferous plants of striking beauty, to adorn the shrubby side of a Grass terrace 600 feet long, half the length of which is open to the south-west gales, and situated high; the other half is sheltered by Fir trees. Can you assist me? Most interesting as is the description of Elvaston, it is on too magnificent a scale to gather hints from. *A Devonian.* [The Limonia in question is a Himalayan plant, really belonging to the genus Skimmia. It is figured in Wallich's "Plantæ Asiaticæ." We want to know how it bears the weather. Among the best Conifers for your purpose are Cupressus Goveniana, macrocarpa, and funebris, Abies Deodara and Douglasii, Juniperus excelsa, Pinus insignis, brutia, and Pallasiana.]

Apprentice Fees.—With your permission, I will just take a passing glance at the arguments of your correspondent "Elpidophorus," published last week. I perfectly agree with the Leading Article in the previous Number, and have no intention to defend the gentlemen of the "blue and green apron" notoriety, leaving them to your correspondent, who seems to understand their "natural history" so well. I wish to say a few words in respect to quite a different class of men—gardeners. I view gardening as a science, and a gardener as an intelligent man, and a respectable man. There are many such at the present time, and your propositions for a moderately high premium with apprentices is excellent, and that no gardener should take part of the wages of any young man for "improvement." By adhering to these rules it is to be hoped that gardeners, as a body, will be much more select than they are now. In the present state of things, weeds will choke up occasionally the more useful production. I do not pretend to say that any gardener has a "legal" right to take apprentices for a profit without his employer's sanction, but I think I am not wrong in saying there are very few gentlemen, who have gardeners of any note, that would have any objection to it—nay, but would rather pride themselves in having a gardener of known abilities. Besides, where is a youth to be taught gardening but in a gentleman's establishment, certainly not in a nursery; that would be about the same thing as to send a lad to a flour-mill to learn the baking business. As to hindering a gardener's time, it is no such thing; the apprentice follows the routine until he becomes sufficiently acquainted with it to cause a thirst for inquiring scientifically into its objects, then is the time he is really learning, and will require some books and explanations from the gardener; this, as a matter of course, is gone into in the evenings. I would, by the way, tell apprentices that no man can become a good gardener in the full sense, by merely following a prescribed set of rules; to be a really useful man he must dive into science, particularly those that gardening bears directly on, such as vegetable physiology, chemistry, &c.; and, in fact, he can scarcely study any science upon which gardening does not bear more or less. I can tell him, too, that none of the businesses or "professions" of the day present more scope for the mind, and that he must not rest under the banner of ignorance, but bring more mind than a common labourer or artisan. "Elpidophorus" speaks of gardeners as "a useful class of labourers;" it is some little satisfaction, after all, to hear that they are useful. Labourers we all are in a certain sense, but employers are generally aware that to have their places properly and economically managed, they do best to employ an intelligent man, not a mere labourer. I console myself by thinking your correspondent does not know the anxiety and responsibility devolving on a gardener, in addition to the many privations he has to endure before he is old enough to take a head situation, which, generally speaking, is five or six years more than that of ordinary trades. Neither do we find them on the whole a discontented body; but, of course, like all sensible men, they strive for advancement, and, I am happy to say, often get it. I will say no more on this subject, feeling assured you will spare no pains to place the gardener in his proper position, no matter whether it be a trade or "profession." *J. N.* [We have many letters on the same subject, but we think it needless to publish more, after expressing our own opinion on the subject in another column.]

Reviews.

Histoire Naturelle des Quinquinas. Par M.r H. A. Weddell, M.D. Paris, Masson. Folio. Pp. 108, and 34 plates, engraved on copper.

At last we possess in the admirable work before us an authentic and complete history of those little known trees, called after a Countess Cinchon, whose medicinal importance may be said to have placed them at the head of remedial agents derived from the vegetable kingdom. Hitherto the real relation which the Peruvian barks of commerce bear to the species described by botanists, and the modes of accurately distinguishing them, or of judging of their qualities by mere inspection, have been among the most perplexing subjects in medical botany; no two authors agreeing upon the subject, and none having the skill to separate the true from the false. The honour of accomplishing this very important task was reserved for Dr. Weddell.

This gentleman, at once a practised botanist, a skilful physician, and an energetic traveller, resolved to solve the great enigma by a personal visit to every district where "barks" are collected. In the words of the French committee, which was entrusted with the preliminary examination of his collections, "the traveller accompanied the bark peelers or Cascarilleros to the vast forests in which the Cinchona trees are scattered, distant many a league from inhabited places. Days and nights he lived in huts with these men; he then followed the barks, from hand to hand, till they reached the port where they were shipped, and thus he was enabled to ascertain personally their real history, which is not always known in the markets of America, to say nothing of those of Europe." Dr. Weddell entirely confirms the statement that there is so little proportion between consumption and supply that the most valuable sorts are threatened with rapid destruction. Nor does there appear to be any probability that this calamity, for such it must surely be considered, can be arrested, unless the best species are introduced into European colonies suited to their cultivation. This is fortunately not unlikely to be accomplished, for the finest of all, the Calisaya, has been raised in England from seed communicated by Dr. Weddell through his friend Mr. Pentland, and we have reason to believe that these gentlemen have also placed seeds in the hands of the East India Company, in many parts of whose vast territories the plant is certain to find a suitable soil and climate. This Calisaya, the discovery of whose real origin is entirely owing to Dr. Weddell, is incomparably superior to the others of the genus. It is the great source of quinine, every 100 lbs. of its bark yielding from 3 to $3\frac{1}{2}$ lbs. of the sulphate.

Not a point in the structure or economy of these plants has been neglected by the author. His detailed observations upon the hitherto ill-understood anatomy of the bark are full of interest and important facts; his botanical discrimination of the peculiarities by which the genera and species are to be distinguished, appear to have exhausted that part of the subject; and the great questions of geographical distribution, climate, soil, and other circumstances affecting the range of species, are discussed at large and fully, without the prolixity so commonly observed in the writings of travellers who are incapable of determining what are the material points of such a subject. Our narrow limits prevent our quoting at much length the views of Dr. Weddell upon this great question, but we should scarcely do it justice were we to omit the following conclusion to his examination of the Cinchona climate.

"To name all the trees or remarkable plants which grow in company with the Cinchonas would be to give a catalogue of a large part of the vegetable productions of western America, or, if you please, of a climate which at one and the same time produces Wheat and Maize, the Sugar-cane and Plantain, Cotton bushes and Coco shrubs. Palms are found through the whole extent of this zone, and in some places constitute a principal constituent of the forests, which are adorned moreover by tree Ferns, huge climbers in countless numbers, great Arads, Cecropias, an Oak (the Quercus granatensis), Bamboos, an infinite variety of Melastomads, with species of Laplacea, Macrocnemum, Lisianthus, Citrosma, Condaminea, Clusia, Myrospermum, Myrica, &c. In a word the Cinchona forests present to the eye that mixture of majestic forms, and brilliant colours, with which it is usual to paint virgin nature in the tropics; and I may add that, excepting the inequality of the surface, I found much general resemblance between the Ipecacuanha forests of Matto Grosso and those where I studied the Cinchonas in certain points of Bolivia and Peru."

"Finally, the region inhabited by the genus Cinchona, as it is now limited, extends over about 29° of latitude. It represents a narrow riband, which with its bends describes a vast curve, following the direction of the great Cordillera of the Andes, commencing with the 19th parallel South, and generally coinciding with its eastern slope, where it maintains an elevation varying a little according to latitude, but confined within the limits of 1200 and 3270 metres. The middle of this curve, which is at the same time its most western limit, and nearest the coast-line, is situated near Loxa, on the 82d degree of longitude west of Paris; its lower extremity touches upon the 62d degree, and its upper disappears about the 70th."

We forbear to enter upon the botanical details introduced into Dr. Weddell's work; opportunities for doing so will occur hereafter, when the species now growing in our garden shall have produced their flowers. In the meanwhile, we refer the reader to the volume itself, which is indispensable in all botanical or medical libraries, and which ought to be found wherever the works of Humboldt have a place.

In conclusion, we have only to add that it is illustrated by a charming view of the Cinchona forests of Carabaya, engraved after a sketch by the author, by 32 exquisite drawings of the Cinchonas and their barks, executed by Riocreux and Steinheil, and by an excellent map of the intertropical Andes, illustrating the geographical distribution of the genus Cinchona.

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

IF the frost continues with anything like severity much longer, a considerable amount of forethought will be necessary in turning the time to the best account by devoting it to such work as can be performed most economically during such weather, and which will facilitate other work in future months. If this principle be not energetically and prudently acted upon, the spring work will be much hindered, and to such an extent that it will be no easy matter for a gardener to recover the proper order and timely succession of his crops. If the Potato crops were not all planted before Christmas, it should be one of the first jobs after the weather changes, and part of the interim may be usefully employed in making preparations for this crop. The non-advisability of using manure must doubtless be firmly impressed on the minds of all our readers, and instead thereof we would recommend the use of burnt clay or charred refuse. Experiments we made last year with these materials convince us that they act in many instances as preventives of disease, and in all cases the produce is clearer skinned, firmer in substance, and better for domestic purposes than the same varieties are when grown on similar ground without this amelioration of the soil. Our mode of proceeding is to plant them as we dig the ground over; after making a trench, we strew some of the burned clay and charred stuff in the bottom, and on it place the sets about 6 inches from the surface, and over them we place a liberal allowance of the mixture, that the young tubers may be formed in it. An important point is, that they have plenty of room between the plants, say from 18 inches to 2 feet, according to the habit of the variety, whether long or short-topped. Some of the hands may be usefully employed in trimming and pointing stakes for Peas and flowering plants, and in making besoms; such work is done as easily now as at any time, and the advantage of so doing will be appreciated when these things come ready to hand at a busier season. Various jobs of this kind will suggest themselves, such as preparing pots, crocks, tallies, &c.

PLANT DEPARTMENT.

GREENHOUSE.—Any plants which have done flowering, or which are commencing their growth, may now be potted. This will include Camellias, Azaleas, Acacias, Oranges, &c. By potting them as they go out of bloom, it will save time six weeks hence, when work is more pressing. In potting these plants, particular attention should be paid to making the new soil sufficiently firm to cause the water to percolate equally through it and the old; after potting they should be placed in a moderate temperature, just sufficient to keep them growing at a rate consistent with the amount of light. Oranges will be benefited by a slight bottom-heat (without increasing the top heat), to enable the roots to get a little in advance of the tops. Great care must be exercised in watering newly-potted hard-wooded plants. Examine the Pelargoniums intended for a June display, and shift any that require it. Those for May flowering should not be potted again. Where these plants are grown in well ventilated houses, they will be benefited by a slight syringing every fine day, about 2 o'clock, as the sun begins to decline. Hyacinths and Tulips, and other forced bulbs, should be freely supplied with water; a little attention in this respect will considerably prolong their period of bloom. Bring successions of these useful plants forward in a mild bottom-heat of about 60°, the top temperature not exceeding 50° to 55°, with plenty of fresh air. No heat suits these so well as that from a bed of well fermented horse litter and Oak leaves. Both flowers and foliage are finer than when they grow in a temperature obtained by means of flues or pipes.

FORCING DEPARTMENT.

VINERIES.—If the Vines have any of their roots in the open border, it should be covered with fermenting litter, to afford a slight heat to them. If the fermenting material rises to about 75° or 80°, it will generally be found that the soil beneath will range from 60° to 65°; a thermometer should be occasionally inserted into the latter, to prevent any injury to the roots, either by excess or want of warmth. A little ingenuity is necessary to make young rods break regularly at this season; it may be managed by bending them down to the bottom of the rafter, and curving them in such a manner as to elevate the buds nearest the base above their more precocious brethren, which in their turn must be induced to break regularly by the same method. After the buds begin to break, let the amount of heat and moisture be carefully regulated, not exceeding 55° by night, until they are all broken, nor 65° by day, unless with sun-heat. Great care will now be necessary to prevent weak and slender shoots, as an undue amount of artificial heat for a few days at this season will do irreparable injury in this respect. Rub off all buds which do not show fruit, as soon as they are distinguishable, except where they are required for the formation of wood. If useless shoots are allowed to remain, they exhaust the stored-up energies of the plant, which ought to be devoted to better purposes, and by the time they are able to elaborate sap, either for themselves or their neighbours, they must be cut out of the way. It should be remembered that only a certain breadth of foliage can be exposed to the direct influence of the sun's rays, and the whole of this should consist of the leaves belonging to the present and future fruit-bearing spurs. It is no less a disadvantage to retain too many of those which do show fruit; if the Vines happen to be in first-rate condition, probably every bud will show a bunch or two, but to allow them all to remain would cause disappointment in this year's crop, and materially injure next year's also. As soon as the most promising shows can be distinguished, they should be reduced to a number consistent with the present power and future strength of the Vines, and in no case should be left more than one bunch on a spur.

FLOWER GARDEN AND SHRUBBERIES.

Propagating half-hardy plants for masses should now be proceeded with, in order that they may be well established before turning-out time arrives. Any kinds, of which you do not at present possess a sufficient quantity, should be put into a warm moist temperature, to induce them to make young shoots. These will strike freely in a similar situation, and after having produced several crops of cuttings, they may be gradually hardened off. Cuttings of scarlet Geraniums, Calceolarias, Petunias, Verbenas, and a host of other things struck now, and encouraged by careful management, as regards potting, and a genial temperature, will not be much behind autumn struck plants; and a fine display is made during summer, in many places where, during winter, only a sufficient quantity of plants are kept to supply cuttings in February and March.

FLORISTS' FLOWERS.

Doubtless many of our readers who, like ourselves, believe that "all's for the best," would gladly see the end of this very old-fashioned winter; though, if our instructions have been attended to, they will have found plenty to do. It is some gratification to know that all the compost heaps have been well frozen through, and that abundance of provision, in the shape of rotten leaves, &c., has been collected and laid up for future use. When the frost goes, the amateur will see the advantage of early potting the layers of Carnations and Picotees, which will in that case look stout and healthy, even after this very severe frost, whilst those deferred till November, will be "not quite the thing." As soon as the frost goes, we shall have abundance of work. Dahlias even now may be started; and if not put into heat yet, it will be advisable to look the stock over, that if any varieties are lost, application may be made in time to replace them. Should mild weather ensue before our next calendar, give abundance of air to all plants in frames; when we say this, we do not mean that they should be exposed in boisterous windy weather; this, after having been kept comparatively closed, would be bad policy; the amateur must exercise discretion in these matters.

HARDY FRUIT GARDEN.

FILBERT BUSHES.—As soon as the female flowers can be distinguished, the bushes should be systematically pruned. All the shoots which do not show fruit should be shortened, regulating their length according to their strength, and spurring the weak ones in close to the old wood; it will be necessary to remove some of the shoots, to prevent over crowding. After regulating the head, clear away the nest of suckers with which these bushes are too frequently encumbered. If the bushes appear weak they should be assisted during the growing season, or, if too strong, root pruned. There is no reason why a collection of Nut bushes may not be as fruitful and ornamental as a collection of dwarf Apples or of pyramidal Pear trees. In pruning, a little precaution is necessary not to remove the whole of the male catkins, until some days after all the female flowers are expanded; and as many of the bushes will, in all probability, be destitute of male flowers, it will be necessary to procure some well-furnished branches from other bushes, and shake them gently over those which have female flowers only.

KITCHEN GARDEN.

At this season we give a slight sprinkling of salt to all ground which has been trenched several weeks, as soon as it will bear treading upon, and after the salt has been applied we fork over the surface. The improvement in the crops by this means is very visible, and thousands of insects are destroyed by it. It is scarcely necessary to add that a dressing of 2 lbs. to the superficial yard is of the greatest benefit to the Asparagus beds, and the dressing may be repeated in the beginning of April. A good dressing of salt is not less beneficial to the crops of Seakale. Besides the increased vigour and health of these sea-side plants, when salt has been freely used, it possesses the additional good property of destroying insects and ordinary weeds, and thus economising labour in the regular keeping of the place. An early crop of round Spinach should be sown this week on a warm border. FRAME POTATOES.—For this purpose, make up a bed of Oak or Beech leaves, sufficient to produce a gentle bottom-heat. They should be started in boxes of leaf-mould, and planted as soon as they have produced shoots an inch long; by taking this precaution all gaps are prevented. They should be planted 9 inches apart and 6 inches deep, with 3 inches of soil between the sets and the bed of leaves. By planting them this depth at once, the trouble of earthing up is avoided, and an excellent opportunity is afforded of getting a crop of Radishes, which will be ready to draw before they are in the way of the Potatoes. It will be necessary, for the sake of both Radishes and Potatoes, to admit air freely, and to draw off the sashes entirely, during mild weather. As soon as the ground will admit of it, preparations should be made for planting new beds of Horse-radish and Jerusalem Artichokes; for the former the ground should be finely broken in trenching, that the new under-ground stems may be formed clean and straight; and as the last-named vegetable seldom comes to maturity in this climate, a very favourable situation should be chosen, that it may have the best possible chance of forming its tubers, although it cannot perfect its flowers. The Horse-radish requires that the ground should be rich and deeply trenched; and that there may be no delay when the weather changes, advantage should be taken of the frosty weather to get the necessary manure in readiness on to the ground. The soil best adapted for growing the Jerusalem Artichoke to perfection is a light rather sandy loam, as a rich soil makes them grow too rank, and puts off the formation of tubers to too late a period.

State of the Weather near London, for the week ending Jan. 24, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 28th Jan., 1843 and 1846; and 2d Feb., 1845—therm. 55 deg; and the lowest on the 27th Jan., 1827—therm. 17 deg.

Notices to Correspondents.

ANÆCTOCHILUS AND PHYSURUS: *G H H.* Place your plants in a situation in the stove where they will have more heat, less moisture, and plenty of light; it is excess of moisture, without a sufficiency of heat and light, that has injured them.¶

AZALEAS—12 HARDY KINDS: *M W.* Rutilans, fulgens superba, Adelaide, exquisita, gloria mundi, triumphans, imperatrix, nudiflora alba plena, dulcedo, belle rosette, pontica alba superba, ardens, Watereriì.¶

BOOKS: *J E.* Any respectable bookseller can procure "Moore on the Cucumber" for you if he chooses.‡—*C E.* "Roberts on the Vine" will possibly suit you.‡—*J S.* See the advertisement of last week. "Paxton's Flower Garden" will be a new work on a new plan. There will be no new edition of the Horticultural Society's Fruit Catalogue for the present.

BUDDLEA GLOBOSA: *L B S.* Propagate by cuttings or layers. It is an old South American shrub, found in every general catalogue that we have any knowledge of. Perhaps Loudon's "Arboretum Britannicum," the small edition in one volume, may suit you.

COFFEE-POT: *Coffea.* Lebrun's Patent. It has stamped on it, "Cafetière d' Alexandre Lebrun. Opticien à Paris."‡

CUCUMBERS: *J E.* Cuthill's Black Spine.‡—*O B.* We are unable to discover any unusual bitterness in your Cucumber; but it is not a good sort, belonging to those bearing the name of Smyrna. You had better use in future some of the black-spined varieties.

ELVASTON: *John Kinloch.* The subject of your request is in manuscript, and will shortly appear. *R. G.*

HEATING: *A Sub.* If you leave the sides of the tank exposed to the house, you will have enough of both bottom and top heat, unless your house is very high.

INSECTS: *J F.* The insects on the plant from Madagascar, imported with the Guava from Jamaica, are the common thrips of the hothouses. The plants attacked had better be removed from the rest, and strongly fumigated. *W.*

JOYCE'S STOVE: *A A.* This will answer the purpose imperfectly, among plants; but it dries the air very much, and should only be used in extremity. The carbonic acid emitted by it will not hurt plants half torpid in winter; although it destroys animal life.

NAMES OF FRUITS: *D M T.* 2, Downton; 7, Golden Pippin; 8, Scarlet Crofton? 9, Dumelow's Seedling; 17, Deux Ans; 4, 5, 11, 12, are worthless, and not at all known in the neighbourhood of London.‖

NAMES OF PLANTS: *J R.* Is it possible that you can be a gardener and not know that morsels of succulent plants cannot be named without flowers?—*J H.* Ageratum cœlestinum, and Eupatorium glandulosum.—*H H.* 1, Lastrea spinulosa; 2, Asplenium Adiantum-nigrum; 3, A. Ruta-muraria; 4, A. Trichomanes; 5, Polypodium vulgare; 6, Lomaria borealis. *S.*—*J D.* Pteris longifolia, very common in hothouses. *S.*—*G W.* Certainly not Styphelia tubiflora; it appears to be Cyathodes oxycedrus.

RHODODENDRONS—12 HARDY SORTS: *M W.* Albertus, Catawbiense superbum, Lowii, Ne plus ultra, Nobleanum ornatum and pictum; ponticum grandiflorum, pictum, and spectabile; tyrianthinum, Victoria, venustum.¶

SHRUBS—12 NEW ORNAMENTAL SORTS: *M W.* Weigela rosea, Spiræa Reevesiana, prunifolia (double), and expansa; Jasminum nudiflorum, Berberis trifoliata, Elæagnus reflexa, Ceanothus rigidus and cuneatus, Daphne Fortuni, Deutzia staminea, Syringa Emodi.¶

TEMPERATURE: *Gallicus.* We regret that we are not in possession of observations sufficient to enable us to say what the average difference would be, in winter and summer, between a thermometer exposed against a north wall and one in the open ground, protected merely from direct solar radiation. The subject deserves attention. The difference between a thermometer protected by an umbrella and one freely exposed may amount to 5 or 6 degrees.‖

TOBACCO: *G R M.* To add charcoal to Tobacco, will do neither good nor harm in a greenhouse.

TOWN PLANTS: *Sub.* The soot and dirt chokes the pores of their leaves, and often kills them; but we should think that with ordinary care most kinds of plants (Conifers perhaps excepted), would live with you as near London as Dalston. See an article on this subject, at p. 822 of our volume for last year.‡

VINES: *A Reader.* The White Muscat of Alexandria will bear the heat of a Pine stove. Vines that have been taken up and replanted should not be allowed to bear much fruit, if any, the first season.‖

MISC: *Maiheae Waltham.* We really cannot advise you. In such matters all men should judge for themselves. You may not find it possible to get into the garden of the Horticultural Society.—*W Loxley.* We shall be happy to get you supplied by the time you mention through our own agent.—One Shilling will be given for No. 1, 1846.

PERUVIAN BARLEY.—This wonderfully productive species was imported by the Earl of Lonsdale in 1847, and promises to be of more real importance to the Farmer, the Maltster, and Brewer, than any grain hitherto introduced. It is scarcely possible sufficiently to eulogise its merits, which have been proved of so high a class that it must eventually supersede all other Barleys, and become an indispensable addition to our cereal crops. Its Malting properties have been found very superior to all other kinds, producing Beer of a much better quality. For Feeding it is inestimable; the grain having no husk whatever, it yields quite as much meal as Wheat, and closely approaches it in quality. Sown in February on his lordship's farm at Barnes, Surrey, on ordinary land, in 1849, it produced 9 quarters to the acre, weighing 64 lbs. to the Bushel. Messrs. J. and C. LEE, sole proprietors of the PERUVIAN BARLEY, being desirous that so invaluable an article should be widely distributed, are prepared to send it out in parcels containing 1 peck each for 10*s*. A remittance must accompany all orders. Post-office orders to be made payable at the General Post-office.—Address, JOHN and CHARLES LEE, Nurserymen and Seedsmen, Hammersmith, London.

THE IMPROVED "FLUE BOILER" AND FURNACE.

W. HILL begs respectfully to inform the numerous applicants for his "FLUE BOILER" of a small and intermediate size, that he shall be prepared, early in December, to supply sizes to suit every description of Apparatus, from that of 100 feet of 3-inch pipe to 2000 feet of 4-inch pipe. A List of Sizes and Prices will shortly be published. W. HILL guarantees his Boilers to be the most effective and economical of any in use.
Horticultural Works, Greenwich, Jan. 26.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY, and Make the Animal look Better than when Paying 12*s*. and 14*s*. per Week.—Consider the enormous saving in these hard times—times of cheapness.—Apply personally or by letter at MARY WEDLAKE and Co's, 118, Fenchurch-street, London, Oat-bruising and Chaff-machine Manufactory, established upwards of 40 years.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s*. 3*d*. to 1*s*. 6*d*. per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d*. to 9*d*. per ft.
HEATING BY HOT WATER.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences. Wire-work, &c.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION, especially with regard to Agriculture, under the immediate patronage of the Right Hon. Lord RENDLESHAM, M.P.; conducted by Mr. G. DOWNES. The Classical and Mathematical branches are entrusted to a Graduate of Cambridge; the Commercial and other departments to efficient assistant masters. A Laboratory, Collection of Philosophical Apparatus, Library, &c., are attached to the school. Terms are moderate and inclusive, and may be known upon application to Mr. G. DOWNES, Wickham Market, Suffolk.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.
GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
London, January 26.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.
Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.
The terms of the School can be had on application either personally or by letter.

IMPROVED FOUR-HORSE PORTABLE STEAM-ENGINES AND BOLTING OR THRESHING MACHINES.
FREEMAN ROE AND HANSON, Southwark Iron Works, and 70, Strand, beg to call attention to their Steam-Engines and Threshing Machines, which are more economical in fuel, for the quantity of work done, than any before the public. They may be seen any day at their works, Sumner-street, Southwark Bridge-road.—Water-rams for raising Water. Deep Well Pumps; Baths; Hot-water Apparatus; Fountains. Towns supplied with Gas or Water.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.—Direct to JOHN LEGG, Cheltenham.

The Agricultural Gazette.

SATURDAY, JANUARY 26, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Jan. 31—Agricultural Imp. Society of Ireland.
TUESDAY, Feb. 5—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Society of Ireland.
FARMERS' CLUB.—Feb. 4: London.

A TRUE CONFESSION!

"During a past year, I was occupying tenant of 270 acres of arable land, at a rent, including rates and taxes, of 562*l*. 17*s*. 2*d*. I employed a capital upon that farm—that is, I possessed a sum invested in it, when the accounts for the year were balanced—of 2871*l*. 16*s*. 11*d*. During that year I reaped a profit of 194*l*. 6*s*. 3*d*.; that is to say, the value of the farm stock at the close of the year, added to all receipts during it, was greater by that sum than the value of the stock at the commencement of the year, when added to all the expenditure during it. This income was the whole return from the employment of that capital. And if the result be analysed as it is in the ledger accounts of the period, the following results will appear: on the pig stock, a profit of 87*l*. 14*s*. 1½*d*., on an expenditure during the year of 121*l*. 16*s*. 4½*d*.; on the sheep stock, a profit of 62*l*. 19*s*. 4*d*., on an expenditure of 961*l*. 8*s*. 4*d*.; on the feeding cattle a profit of 193*l*. 15*s*. 1½*d*., on an expenditure of 564*l*. 17*s*. 7½*d*.; on the Clover crop, an expenditure (loss) of 33*l*. 5*s*. 2*d*.; on the Turnip crop an expenditure (loss) of 99*l*. 17*s*.; on the Carrot crop, some having been sold at 30*s*. per ton, a profit of 41*l*. 9*s*. 4½*d*.; on the Potato crop a profit of 27*l*.; on the Mangold Wurzel crop an expenditure (loss) of 42*l*. 0*s*. 5*d*.; on manures a cost (loss) of 37*l*. 5*s*. 8*d*.; on the Wheat crop a profit of 99*l*. 11*s*. 4*d*.; on rent a cost (loss) of 562*l*. 17*s*. 2*d*.; on implements a diminished value (loss) of 7*l*. 3*s*.; on horses a cost and diminished value (loss) of 277*l*. 7*s*. 7½*d*.; on a general account, under which sundry sums are put, for which an imperfect arrangement of accounts has provided no other place, an expenditure (loss) of 129*l*. 2*s*. 8½*d*.; and on a dormant capital account a loss by efflux of time (the period of the lease approaching) of one year's interest in tenant's capital invested in draining, buildings, &c., of 11*l*. 15*s*. During the year I refer to, I spent on this farm 701*l*. 16*s*. 8*d*. in wages and petty expenses connected with marketing, attendance on live stock, and barn work: thus I spent in this way 225*l*. 15*s*. 1½*d*. on the Wheat crop; 16*l*. 9*s*. 5*d*. on the Clover; 40*l*. 13*s*. 10*d*. on the Carrots; 54*l*. 8*s*. 10*d*. on the Potatoes; 89*l*. 16*s*. 2*d*. on the Turnips; 11*l*. 8*s*. 8*d*. on the horses; 49*l*. 17*s*. 0½*d*. on the feeding cattle; 41*l*. 12*s*. 8½*d*. on the sheep; 21*l*. 2*s*. 4½*d*. on the pigs; 65*l*. 17*s*. 0½*d*. on the general account; and 42*l*. 15*s*. on the dormant capital account. I specify these latter details in illustration, not of its money result, but of the style of cultivation which I had practised; it is the former series of particulars that explains the cash balance of the year's proceedings; collate them and you will find that on the whole my receipts during the year exceeded my costs by 194*l*. 6*s*. 3*d*. Nothing is put down among the latter for my household expenses—they are a matter quite apart from the business of the farm; nothing is put down for the cost or market value of the year's use of the money invested—the sum stated in the whole return for its use which agriculture has in this instance provided: neither has anything been put among the costs of the business, for the market value of the skill with which it was conducted, for, in truth, I am inclined to think that it was the *want* of skill rather than its possession to which, in this instance, the returns from it were owing."

Such is the statement of a tenant farmer—he sold his Wheat during that year at prices varying from 50*s*. up to 60*s*. per quarter, and a considerable quantity for seed fetched even 8*s*. per bushel. Beef was then worth 6*d*. per lb.; and mutton, sold during spring with the wool on, was worth 7½*d*. per lb. With these prices he obtained by the year's farming hardly 7*l*. per cent. for his capital. And if his returns were so low when he suffered no extraordinary losses of any kind in his stock, or indeed in any other way, if we except the Potato crop, which seems now to be pretty generally regarded as a sort of agricultural interloper, which has no place in statements of ordinary farm experience—if his returns were so low then, how shall he ever hope to weather a period of prices 20 per cent. lower than those he then received.—This is, indeed, the last dying speech and confession of the unfortunate man, and agricultural bankruptcy seems to be an inevitable consequence. Not so: listen to him again.

"I have had some years' experience of farming since that time; and some of them have yielded a much poorer return than that which I have specified in detail: but it has not always been the year of high prices which has been the most profitable; and the current year of low prices has advanced sufficiently to enable me to anticipate with confidence a better result from my proceedings during it than I have obtained during two or three of the past seasons. This will arise from a larger balance to the credit of the cattle and sheep stock, notwithstanding that beef is being sold at 5½*d*., and mutton at rather less than 6*d*. per lb., with the wool on. And to this I shall look, for the future, as the department in which most improvement is possible. Low prices, however undesirable, have this advantage, that sums invested in the purchase of cattle-food will now procure a larger quantity, enabling the fattening of a larger herd, and so producing more manure, and occasioning a higher fertility of soil. The 277*l*., for instance, of which at least three quarters were spent on horse-corn, will, during the present year, be represented by a sum at least one-third less. But, whatever the whole effect of diminished price may be, I can see many methods, dependent merely upon economy, in which the several balances to the credit of my different accounts may be increased. Cattle, where bought to feed, may be purchased younger, and therefore at less cost, and easily fed up to the value at which they were formerly procured, at little expense beyond that of food which has till now been wasted. Straw now used almost wholly as litter may be carefully consumed as fodder. Root crops may be consumed more sparingly, so as, by a given quantity, with the aid of an increased purchase of food, to keep more stock. Manure may be preserved more carefully. I paid upwards of 350*l*. to my predecessor for the manure upon the farm when I entered it; and I have thus, literally, nearly 400*l*. worth of dung every spring in the fields, and yards ready for application to the green crops. What would be thought of a man who had as much money invested in implements without a cart-shed in which to shelter them? And manure is far more liable to loss and injury by exposure than carts and waggons are: but whether under the circumstance of my lease it is my interest or not to erect shelter sheds for my manure heap; at all events I can save much that is now wasted, by a more careful management: and a saving here will, we know, soon affect farm experience in every department, increasing the balance to the credit of all the accounts in the ledger. Lastly, the expenditure of the current year will be considerably diminished in the article of labour; and that, not so much owing to diminished employment having been given as to diminished wages."

Now the advice and the comfort which the farmer takes to himself may be offered to many others. Let the raw material of the manufacture in which the farmer is engaged once attain its natural position, and the value of labour assume the status which, in relation to its new conditions, properly belong to it—once let rent and wages accommodate themselves to present prices, and present prices will immediately become profitable prices. But these two subjects—rent and wages—must be more fully discussed hereafter. We must content ourselves at present with having drawn attention to some of the details embraced in a general view of AGRICULTURAL ECONOMY.

CHRONICLES OF A CLAY FARM.

SECOND SERIES.—No. IV.

DAYS—weeks—months—how you drift away! bearing the present time with all its clamorous and busy sounds of life, into that long wake that stretches far—farther than the eye can reach—behind us! How you float past—boiling and tumultuous at first, as just escaped from the din and turmoil that marks the everlasting conflict of our onward course—then gently and deceitfully subsiding off with only a rising ripple here and there, that beckons to the eye and tells of something that *will* be remembered—some duty unperformed—some happiness perceived too late—then, at last, sinking away into the smooth surface that stretches far behind in undistinguishable outline, blending both near things and remote into one great PAST, and leaving us to wonder at the intensities of fear and hope, of vanity and usefulness, of evil and of good, with which each moment as it passed seemed pregnant.

How *wise* we are, as we look back! How clear-sightedly we discover each blunder, and its cause; how surely we believe that *here* at least and *there* at least—

forgive us this once, oh! Common sense and Judgment—and we will promise *never* to be such fools again!

Did ever man build a house—or farm a farm—or even drain a marshy meadow—and not feel some touch of this provoking after-wisdom that comes too late, telling of material and money wasted—plans insufficiently considered, too hastily accredited—tiles mislaid, too shallow or too deep, or in the wrong direction? In the matter of brick-and-mortar such aftersight is grown a proverb; and is it otherwise in land? Let him that has never felt it, cast the first stone: *he* has known little of Life's learning who has never repeated to himself how true it is that Experience is never *given*, but always *bought*;——at the top of the market too!

But there is this consoling difference between *Bricks*, and *Tiles*,—that is to say, between Building and Farming: that whereas in the former case you always find your cost in having done too much, proceeded on too large a scale—in the latter case you mostly find, such at least was my discovery—that your unprofitable expense is for ever peeping out in the niggling nature of your plans—field by field, hedge by hedge, drain by drain, a tank here, a cowhouse there—you have *waddled* through your Farm, denying your better instincts, resisting the true economy which would have prompted a complete and comprehensive plan that looks the whole matter in the face at once: as though a man should build a mansion room by room, and paint and furnish and roof them in, one by one, solemnly counting the cost all the way and shutting his eyes to the conviction that the next room—and the next story, must come at last—and that one roof, one plan, one outlay, the cheapest because the most compendious, might have covered all, and saved the worry and mortification of jobs *un*done, arrangements altered and blunders deplored.

Architects are expensive things it is true—but still the comprehensive plan is the cheapest in the end. We want *Farm-Architects*. Not (Heaven help us!) that we want more expense in farming, or in farm buildings, but a kind of knowledge in the whole laying out of a Farm, analogous to that of the architect who plans a building. The Landlord, the Tenant, the Bricklayer, the Carpenter, the Workmen, and last not least the gaping Neighbour—each has his opinion, and gives it freely enough. The result is generally a mongrel compromise between them all. No one voice—no one plan is predominant, and by the time the whole outlay is expended, the job is half a job, and the ship is spoilt for a ha'p'orth of tar and an ounce of oakum. The extreme of cold, as well as the extreme of heat, will leave a blister on the fingers.

Five months had winged away—and the glorious spring of that eighteen hundred and thirty *odd*, afore dated with such edifying minuteness, and now hanging up like a cobweb in some neglected passage of this Chronicle — had fallen into something more than summer—since the Wetlandshire Mercury had typified to the world at large that a certain farm was to be let, at a certain time. 'Fourteen' applications by the first post, duly forwarded by the prompt Firm of Penn and Debbitt—(and how many more by the next—and the next—what boots it to particularise?) had been forwarded in vain. For a blight had fallen—the strangest of blights!—the blight of Plenty, over the sons of the soil, and before September had crisped the morning air, and the partridge-chick had found cool midday covert under the young Turnip-leaf, every county journal had its broad page of 'Sales of Farming-Stock' set in types in which he who ran might read—something more than met the eye.

"—— Fallen upon bad times!—all up with farming, I doubt, Sir!" said a muffled voice, out of a red-striped neck-warmer; joggingly; for the utterer of the sentiment was on a rough nag, not a 'good'un to look at,' but he *went*—as an old clock does, by habit—with an ash stick *steadily going*, for pendulum, on one side, and a spur peeping under the left gaiter, and steadily going too, on the other, for regulator.

——"All up with farming I doubt!"

And the speaker threw an eye sideways to therider on his left, as he repeated the last words—an eye *most* expressive—for with the good natured 'crow's foot' that nestled close up to it and seemed to tell of home-feelings and fire-side memories, there was a momentary wrinkle, a peep of something well accustomed to concealment, that glanced out for an instant—telegraphing (how rapidly!) a half century's experience of the words 'From the Sweat of thy Brow shalt thou eat Bread.' Yet not complainingly: too truthfully and heart-whole for that.

No answer came. The ash stick went on steadily: and the spur; for the tail performed the part of index—a true *tell-tail*, swishing and signalising to each application of the blunt rowel upon the same spot, grown horny and resistful under its influence. The mouth that had spoken dropped into the neck-warmer again—and the kind but care-*full* eye looked straight forward, with its fellow, into the early morning fog that lay upon the road and fields, and dripped upon the hedges, where the gossamer had hung its tiny tissues, waiting patiently for Sunrise. *Click, click, click, click*, went the aggravating off-side hind-shoe, for half a mile nearly, before another word was spoken.

"Any chance of *it's rising again* d'ye think Sir?"

Still no answer. The question could not have applied to the Sun, for his great red merry countenance was just beginning to peep, enormously big, over —— hill, like some jolly welcome-faced friend, half behind the door, glowing with the knowledge how the heart of him, or her, who sits within will *rush* presently to tear away the screen that separates them. It could not be the Sun: for he is half up now, and yet no answer from that thoughtful-looking Quixote, that sits his mare as if he was riding in a dream, and had lost the power of utterance. It was strange, too; for he had been no moody companion from the time farmer Greening's trotting nag overtook him on the road; and if he had been, Mr. Greening wasn't the man to have hailed him in the merry way he did, and especially in such times: he would have gone by with the respectful, and self-respectful, morning salute of one who never intruded, nor retreated, on life's highway, in the matter of companionship. But *that question*—What was there in it that had stopped the way-cheer of discourse, and set one of the parties thinking like an oracle? It was lucky that his mare happened to make a false step as he turned her from the footpath where she had (no business to have) been nursing her hoofs, for it made him wake up, and say, "I'm not sure, Greening, that I can answer your question, but I can tell you how I answered one of the same sort a fortnight ago, to a man who came to look at my vacant farm."

"Oh! I heerd of it, Sir, I heerd of it! They was telling of it the other night at Bogmoor: and didn't tell it bad either: old Dobson said the West-country gentleman stood up to his full height (and he wasn't a short'un either), and says he, 'Pray, sir, how many bushels of Wheat will this farm grow to the acre?' pompous-like; and says you, drawing up queerly (and, beg pardon, you ain't a very tall'un, Sir), and looking calcylating and confidential-like, 'From 15 bushels to 50,' says you; and we all laughed a good'un, for we knew your look somehow: and I know'd how you'd say it, and what you meant pretty well. Yes, yes! I heerd o' that. He didn't like it, however. I think if you'd 'a' said *thirty* he'd 'a' had the farm."

"No!"

"Not? Well I don't know. Dobson said he seemed smartish like, and he didn't mislike the look o' the stubbles, nor the rick yard neither. What did he say to your crop o' swedes in the forty-acre piece, the Brickfield-close I think you call it? Didn't he think *them* big enough?"

"He didn't tell me: he couldn't, indeed: for he only looked over the hedge at them, saying that 'it wasn't a Turnip farm.' As he spoke to himself rather than to me, I didn't 'gainsay him. But as it takes me a long time to say anything smart, I accepted that as a *notice*, and prepared my answer for what I foresaw was coming when we had done riding through the stubbles: and as I think his hoofs were on every acre of them, I had time enough for preparation."

A short silence ensued. The Ash-stick and the spur seemed to work less emphatically. The horses dropped into a walk: they were nearing the town of ——, which began to loom through the morning mist. The approaching termination of the ride seemed to bring the two saddles closer together.

"I think I know what you mean. I had an inkling of it before, when I heard the story from old Dobson; but I see it plainer-like now, after what you've said. You likes a man as thinks of *grace before meat*," said Mr. Greening in a sort of under tone, and looking up into the face of the other, significantly, and with an expression of half inquiry.

"You've described it shorter and better than I could have done; you've hit the nail on the very head," said the other.——"I don't know how it is, Greening, but these dark misty mornings bring some thoughts into my mind that I hardly know how to tell exactly as I feel them. But this I know, that some of the thoughts they bring make me shrink from the very sight of a man that looks at nothing but the Wheat stubbles. I'd as soon ride this mare straight into the knacker's yard"——

"Lor' blesh ye Sir!"

"Well—you understand me; it's but a young 'un, certainly, for that last journey; but I should feel less sin or shame in that, than in letting a farm to a man who looks at the stubbles first, and the Turnip-fields afterwards, or not at all. The knacker has an eye for a horse"——

"For the dogs."

"Exactly! and so have some men for a farm. It does seem to me strange that all these pamphlet writers and law-makers should have omitted this—but I forgot—I am afraid you and I are not quite on the same bench in that question."

"Ah! don't 'e say so, Sir! I *should* like, uncommon, to have a bit of a talk with you, though, about *that*. It beats me entirely when I hear tell that you ar'n't——that you go with them there free—"

"Take care! take care! said the other, turning quickly in his saddle, as the fore-horse of a wagon-team turned suddenly at full trot down-hill from a side lane, into the high-road, grazing Mr. Greening's unspurred foot with the point of the leader's stretcher, and bringing the whole team, and the wagon after them rumbling round the corner, a very near shave and at the imminent risk of spilling a sack or two of Wheat that lay not very safely on the near-side shel'-board.

"Aye! there ye go," said Mr. Greening, rather angrily, as his rough and hot-coated nag jumped with some alacrity against the pathway out of reach of the wheels, pressing the other rider pretty close to the ditch, as the wagon passed on before them—"there you go Mr. Cropfield with your new Wheat and your Straw again! I wonder how many sacks to the acre you've grown upon last year's Oat-stubble *this* time! Do look at the boultings, Sir! That's for *litter for the team* I suppose! He's late to market with *that* load; no wonder the' go so fast. Well, if it ain't enough to make an honest head ache to see that!" added the indignant farmer, in a tone of unusual sarcasm. "That's what I call taking the new-laid eggs to market, and the *hen along*."

"Wheat on an Oat stubble!——He brings back manure, I suppose?"

"Aye for the Barley-crop; or Oats again, may be: it's all the same: he *counts back'ards*; he begins with the grain, and ends with—no he never comes to the *green*. He says *stems* pay quicker than *roots*; and Stock's expensive; so he starts at once with the high figures—though, my life! 'tis but a low 'un now, for that matter. *Do you* think, Sir, it 'll ever get up again?"

"The old question again! I'm afraid, Greening, you'd never hear out the answer, even if I could give it. Sharp questioners are impatient listeners."

"Oh! trust me for that: if you'd spare me the val'e of a half hour's walk through those Swedes again (I should like to see how the dibbed ones get on), I think I can take all you'll give, and ask for more, after."

"Oh, you're most welcome to see the Swedes: you'll come round to the dibbing, depend on it, and when we've done there"—

"I shall come round to *something else!* Ah! that's capital! No, no, no, no!" said Mr. Greening, laughing and suddenly bending his pony's shaggy neck with a jerk of both reins towards the street that led into the cattle fair, for they had reached the town, and the turn brought the colloquy to an end. "Well, I shall keep you to your promise, Sir, howsomever. Please to look out for a trespasser on Monday morning, you'll be most like to catch me early. I hav'nt forgot your words last autumn about the matty—what was it—the mattytynial hours."

"You'll be my fast prisoner to luncheon-time. Well, good day, Greening, and a good fair!"——Ah! those 'matutinal hours!' I repeated to myself, as Mr. Greening's good-natured face nodded away, and the ash stick and the well-worn spur, and the click, click, click of the hind hoof were lost up the street, towards which Nelly swerved sympathetically for a pace or two before she swung again into her usual trot, and forgot her little rough-coated companion. *Talpa.*

TITHE COMMUTATION.

As your agricultural as well as clerical readers may feel anxious to know the result of the corn averages for the seven years to Christmas last, published in the *London Gazette* of this evening, viz.:

Wheat	6*s.*	7½*d.*	per imperial bushel.
Barley	4	1¼	" "
Oats	2	8⅓	" "

I beg to state for their information that each 100*l.* of rent-charge will, for the year 1850, amount to 98*l.* 16*s.* 10*d.*, or about 1¼ per cent. lower than last year.

The following statement from my "Annual Tithe Commutation Tables" will show the worth of 100*l.* of rent-charge, for each year, since the passing of the Tithe Commutation Act, viz.:

		£	*s.*	*d.*
For the year	1837	98	13	9¼
"	1838	97	7	11
"	1839	95	7	9
"	1840	98	15	9½
"	1841	102	12	5½
"	1842	105	8	2¾
"	1843	105	12	2¼
"	1844	104	3	5½
"	1845	103	17	11½
"	1846	102	17	8¾
"	1847	99	18	10½
"	1848	102	1	0
"	1849	100	3	7¾
"	1850	98	16	10
	14)	1415	17	6¾
General average for 14 years		£101	2	8

Charles M. Willich, 25, *Suffolk-st., Pall Mall, Jan.* 8.

LIQUID MANURE.

Mr. Smith, of Deanston, lately read a paper, on the Collection and Application to Agriculture of the Sewage Water of Towns, before the Philosophical Society of Glasgow, from which we make the following extracts:

The removal of the sewage water, in its original fluid condition, by pumping, and its conveyance in pipes to the spot where it is to be applied, obviously afford a simple and efficient mode of dealing with it. It has been ascertained, by careful calculation, that sewage water can, in this manner, be taken up and conveyed a distance of 10 miles, and be thrown upon the ground in most equal distribution, at a cost of 3*d.* per ton, containing all the elements, unchanged and undiminished, and be presented to the great chemist, Nature, to be dealt with by the never-ceasing and costless labourers of the vegetable kingdom. The pumping, conveyance, and distribution had been tested at several places on a sufficient scale to demonstrate its perfect practicability and efficacy. The first experiment of the pumping conveyance in pipes, and distribution by hose, was made at Clitheroe, in Lancashire, under Mr. Smith's direction, by Mr. H. Thomson, of the extensive print-works there. The liquid consisted of the sewage of a village of the ordinary character, with that from the works, which contained, of course, a greater amount of soap-suds and alkaline matter: this was thrown into a tank containing the drainage from a farm-yard. The pumping, conveyance, and distribution by the hose answered admirably. The experiment was made on some old meadow land. This liquid was applied to a meadow at the rate of about 8 tons per statute acre, whilst farm manure, at the

rate of 15 tons per acre, was applied to a corresponding extent. The Grass from the liquid manure grew considerably more luxuriant than that from the farm-yard manure; but, unfortunately, the relative weights produced were not ascertained on cutting. The next experiment was made on a farm on the estate of Possil, near Glasgow, by Mr. Robert Harvey, of the Port-Dundas Distillery, who, in the most enterprising and spirited manner, at Mr. Smith's suggestion, laid down pipes for conveying liquid manure over his whole farm, consisting of upwards of 300 acres, and had the liquid manure from a dairy of upwards of 500 cows pumped to an altitude of more than 70 feet. The distribution of liquid manure has been carried on on this farm for more than four years, very little solid manure being used, except for comparative purposes. The distribution is chiefly on what may be termed the low pressure system, as, instead of being jetted with force to form an artificial shower, it is simply allowed to be discharged upon the surface (by tin-plate pipes of about 1½ inch in diameter, and 4 feet long, fitting into each other with slip joints, and these can be led to discharge the liquid at any point within their range, which can be extended to a length of 200 or 300 yards if necessary). In this manner one man can distribute the manure over from one to two acres per day. The manure is thus applied to pasture land, to Grass for cutting, for house feeding, and for making hay. It is applied also to stubble land and to fallow, and has uniformly raised magnificent crops of Grass, Potatoes, Turnips, Wheat, Beans, Barley, and Oats, on land not of the best quality. These men are employed during the whole year in distributing the manure, and go on in wet weather as well as in dry. Mr. Harvey has lately extended his system of pipes, and has erected a 12-horse engine, which is more than master of the work. The Sewage Manure Company of London, which obtained Acts in 1846 and 1847 for taking a portion of the sewage water of Westminster, has, after much untoward obstruction and delay, got to work with a 30-horse engine, and is now distributing the liquid in several of the market gardens at Fulham, and upon meadow land in the neighbourhood, with most satisfactory results. The Company receives 3*l.* 10*s.* for the season's watering of the garden ground, and 2*l.* for that of the meadow land. The results in growing Lettuce have been very extraordinary, a market gardener admitting that he had sold the Lettuces from an acre of land, so watered, 14 days earlier than that from some land which had not been watered, and that the pecuniary result had been 25*l.* per acre more. The operations of the Company are going forward, and in another season the value of liquid sewage manure will be fully demonstrated. The water at present applied by the London Company is very much diluted, and has very little smell, and being immediately absorbed by the ground, all offence is avoided. It was at first thought by the engineer of the Company that it would be necessary to employ their own servants to make the distribution; but it has been found in practice that the men, women, and boys who are usually employed about gardens are quite competent to the work, under the direction of the master gardener, so that the whole matter is, in the mean time, left in his hands to use the liquid as he considers most fitting.

It has been objected by some that the distribution of the sewage water would generate miasma all over the country, to which it may be replied that the matter taken from the sewers being in a fresh condition, and before it has had time to pass into any extensive decomposition, and being, in itself, much diluted with water, to facilitate its conveyance and distribution, and being thrown over an extensive absorbing surface, with a great area of atmosphere, any poisonous matter that may emanate from it will be so diluted that it cannot affect the health of man or beast. It is impossible, with present information, to determine what may ultimately be the profit derivable to any community from this source; but, taking what data we have from scientific inquiries, as well as that from the practical experience which has been worked out, it does not seem extravagant to anticipate a free yearly income of 1*l.* for each individual of the community. But, to render the estimate safe, in the first instance it may be made at 10*s.*, which would afford to the city of Glasgow an income of, at least, 150,000*l.*, which would put it in the power of the public authorities to root out by degrees all the narrow and unwholesome lanes, and the wretched dwellings, which are a disgrace to the present age, and to carry on continously the progressive improvement of the city. It has been suggested by many, that customers will not be found for the manure in this condition to so great an extent; but it must be obvious to every intelligent agriculturist who takes the trouble to make a survey of the surrounding country, and it will come home to the experience of every farmer, that there is everywhere a great want of manure to produce the fullest effect. If manure can be furnished in this manner at half the cost of ordinary manure, and be laid on the ground when the farmer wishes it, without carting over his land, with very little trouble to himself, and with results beyond the average of ordinary crops, there can be no doubt of finding customers everywhere. The crops of the farmer who uses this manure will excite the jealousy of his neighbours, which will lead them, I would almost say force them, to follow his example.

In order to test the usefulness of the manure in the liquid form, Mr. Smith said he had made extensive inquiries for several years. A number of experiments had also been made with the view of testing the practicability of dealing with it in the liquid form, and ascertaining the cost at which it could be pumped into pipes, and thus conveyed into the country. It was ascertained that sewage water can be conveyed, by pumping, 10 miles, and delivered on the ground for 3*d.* a ton, with a moderate profit; whereas to cart a ton for 10 miles, costs 5*s.* The liquid is not only conveyed at this charge, but distributed. The expense of distributing liquid manure, by cart, is considerable, and, in the solid form, it is more expensive still. Mr. Smith next remarked, that the sewage water of large towns contains all the elements of the food used by the inhabitants and by animals. These elements exist in the state of mechanical mixture, of suspension, and of solution. A large dilution of these matters with water not only deprives them of smell, but fits them better for being applied to the land. The suspended matter moves easily in properly constructed sewers, and can be conveyed with facility through pipes. The sewage matter applied in the liquid form is much less liable to be washed away by rain than when applied in the solid state; and, besides, both chemical investigation and the results of experience combine to show that solid manure is less valuable than manure in a state of suspension or solution. In the Meadows at Edinburgh, which are irrigated by sewage water, it is found that the matter in suspension has a tendency to lodge at the roots of the Grass, causing decay; while the fluid manure which ultimately remains, after flowing through several meadows, produces the healthiest and best Grass. Some of these meadows are let for 30*l.* to 50*l.* for the cutting of the Grass. Six different specimens of water from the meadows, of a gallon each, yielded—1. Water taken up immediately on its leaving the sewer, 244 grains of solid matter, and 82 grains in solution. 2. Taken as it flowed from subsidence pond, 52 grains of solid matter and 87 grains in solution. 3. Taken after having flowed over one plat, 31 grains of solid matter and 89 grains in solution. 4. Taken after having flowed over several plats, 15 grains of solid matter, and 82.7 in solution. 5. Taken still farther on, 2½ grains of solid matter, and 67.2 grains in solution. 6. Taken at sea when passing away, 2½ grains of solid matter, and 72.9 grains in solution. The meadows farthest from the source of the sewage water consist of poor sandy land, yet they produce better Grass, in consequence of the water being deprived in its progress of its grosser matter held in suspension.

Home Correspondence.

Emigration.—The necessity of systematic emigration having been sounded in the ears of authority for many a long day, without making any impression, a dawn of light appears to be shining at the eleventh hour, which it is to be hoped will not be dimmed without producing happy results. Had a place of colonisation been carried out 30 years ago, the labouring classes in the country would have improved both in conduct and intelligence; and poverty would have been the exception instead of the rule amongst that class. Where there is a limited extent of territory in the mother country, and her colonies are numerous and fertile, common sense points out the safty valve for an increasing population; that emigration should never have been taken up as a grand feature in political economy, only proves the want of foresight, or wilful determination not to profit by experience. England may well be said to be penny-wise and pound-foolish, putting off from day to day work which should be accomplished at the moment, spending millions in the futile attempt to remedy an evil by palliative measures, which can only be surmounted by vigorous action, guilty of procrastination, which creates difficulties and dangers, rendering "the last state worse than the first." Our peasants and artisans are on the whole a patient and deserving class, calling forth our sympathy in their distress, and how has it hitherto been answered? By casting their misfortunes in their teeth and offering them the workhouse, instead of providing profitable employment for those willing to exert themselves, and earn their daily bread. To say that all the hands are occupied on the land which can be, with any prospect of making a return for capital, is assuming what is not the fact. Let it however be admitted, for the sake of argument. Let the question then be asked, Is it advisable when a man applies for relief to take him and his family into the Union, or assist him to emigrate as a useful member of society? The very expense of keeping a man, his wife, and children in the workhouse for one year, would more than defray his passage out to Australia, and provide him with tools to set him up on his arrival. An industrious man thus sent out would never lose his attachment to his native country, but would in after years do her good service by his loyalty in preserving her possessions from revolt and separation; as well as by forming a market for the surplus productions of our manufacturing towns. Our best colonies have been considered as mere receptacles for convicts, thus peopling them with the refuse of society, and planting a race in our strongholds, who can have no pleasant reminiscences of the United Kingdom. A difficulty may be started, as to what we are to do with those sentenced to transportation; despatch them to Sierra Leone, the most fitting destination for those who have outraged society at home by their crimes. Mawkish sensibility may exclaim, What cruelty! But are we to show more commiseration for our culprits than for our hard-working labourers? Are we to provide every comfort for a man guilty of offending the laws, and tell the honest man he may starve unless he commits crime? Are we to continue to tax those who rise early, and toil through the day to pay rates, to be expended in pampering thieves and vagabonds? If one man knocks another on the head, and robs him, he should know that he must, if discovered, pay the penalty of his wickedness, and end his days far from his native land—not in luxury, in a most salubrious climate, but under a burning sun he will have to expiate his delinquencies, in sorrow and hard toil. Little pity is shown for our officers, soldiers, and sailors, who are doomed to breathe the pestilential atmosphere of the coast of Africa, with a view to prevent the slave trade, which all thinking men know to be impossible. Ladies over their tea, and gentlemen with straight hair, will expatiate by the hour, on the subject of inhumanity to the negroes, and the horrors of buying human flesh; but they seldom give a thought to the gallant fellows who sacrifice their lives in a cause as hopeless as washing a blackamoor white. The comfortable state of our goals, and the diet served out to men who disgrace themselves, is rather a premium to misconduct; many an idle vagrant committing a petty theft, in order to partake of the bounties of the prison. The lands of sunshine and plenty should not be appropriated to the ill-conditioned, but should be reserved for the surplus population of our own flourishing country. Our foreign possessions are the points we are to look to for our future markets, therefore honest men should be sent out as a reward for good conduct, giving them an opportunity of improving their condition, at the same time relieving the country from a heavy burthen, and the great responsibility which it incurs by pauperising a body of useful men; instead of turning their talents to account on the virgin soil of distant lands, where peace and plenty await them, and where they may in a short period become independent of the world, and reflect back credit on old England. Let us no longer waste sentiment on the criminal whose repeated offences evince a hardened disposition, and whose very nature is impervious to charity and kindness; but rather seek for sterling worth in the labourer's cottage, who procures a bare subsistence by untiring toil; such men are real objects of benevolence, and would well repay exertions on their behalf. Let us no longer begin at the wrong end of our task—encouraging thieves and vagabonds of every description, locating them in the finest climate, feeding them with the best, and being guilty of other inconsistencies, whilst the loyal and poor man is doomed to perpetual wretchedness and neglect. *Falcon.*

Liquid Manure.—Having instituted some experiments in gardening and agricultural concerns, in conjunction with a professional person of great intelligence and practical information, the issue may not be unworthy of notice. The first had reference to the substitution of pointed lightning conductors for training Vines, instead of the ordinary mode, by which instrumentality, the electric fluid, that known and powerful agent in promoting vegetation, is insensibly drawn from all transient thunder-clouds. An old hogshead also was sunk in the ground, in such a position that the Vine root might extend into it with facility. The vessel was then filled with liquid manure, the lid put on, with a tube inserted for replenishing it when exhausted, and the place covered in with earth. This plan was tried with perfect success, the Vine encircling a conductor, and nourished with the liquid manure, far surpassing in luxuriance of growth any of its adjacent neighbours, bearing a profusion of Grapes, superior both in quality and flavour. Hence I was led to examine the properties of the different descriptions of manure, and found that the animal kind, when completely decomposed, is best adapted for farming purposes. The case is similar with regard to stable and cow-house liquid manure, which is equally effectual. An inference may fairly be deduced, that the pointed and tiny blades of corn, as well probably of all plants, serve like small conductors, to establish an equilibrium between positive and negative electricity. Should this conjecture prove correct, some important changes may be introduced in husbandry, by which much of an invaluable article may be saved that is now improvidently wasted or lost, and cultivation extended at diminished expense. The preservation of liquid manure is an object that deserves the utmost attention and care. The requisite drains and tanks, or cesspools, can be cheaply constructed according to approved designs, either on a moderate or a large scale. At the same time, nothing contributes more to the cleanliness of the cattle, or the improvement of their condition, including all stock, sheep, pigs, &c. It will be no longer necessary to despatch ships to remote parts of the globe in search of guano, when a preferable substance lies abundantly within reach, and is easily procured. By the proper application of such means, seconded by skill and industry, no limit can be assigned to the production of green fodder, to the use of stall-feeding, and consequently, to the raising of rotation crops. For instance, it is advisable that all seed before sowing should be steeped, until saturated, in liquid manure, of sufficient consistency to form an adequate coating for each grain, no more being suffered to adhere than is actually required, in relative proportion to the species, as too much action is over exciting to the delicate sprouts under an artificial system. The process is peculiarly beneficial with respect to spring Wheat, Peas, Beans, Carrots, Beet, and early Potatoes. In garden business, it is strongly recommended to dip previously in the same material the roots of vegetables that need transplanting. Under operations of this nature, and with prudent management, double advantages will be gained, in economy of outlay, in manure, and in the cost of labour. These brief suggestions are submitted for consideration, with an anxious hope that

they may engage attention, as, judging from the best of experience, I feel persuaded that their adoption will not fail to realise the expectations entertained, by insuring increased returns, and yielding ample fruits at the period of harvest. *M. T. K.*

Practice with Science.—Such, as has been shown, being the advantages of high farming, it seems strange, nay almost inexplicable, that the advances towards it should have been so tardy, and that a large part of the country should still remain under the old system, with Grass land bare and neglected, and a limited portion of ploughed land dirty and poor. The cause of this is not easily explained, but it seems to have been derived from a variety of adverse circumstances, and until these undergo a change, no great hope for the future can be entertained. If we look at those more fortunate countries where a change has already taken place, we shall find that this has frequently proceeded rather from fortuitous than natural causes, and that they owe their advancement not to any systematic or deep-laid schemes, but to a lucky chance. It is now nearly half a century ago ("New Husbandry," page 26) since Messrs. Bailey and Culley, employed by the Board of Agriculture, reported that the three best cultivated counties in the kingdom were Norfolk, Lincolnshire, and Northumberland; and that if all the other counties were cultivated in like manner, one-third more produce would be raised in England, and one-half more in Wales. Has this stigma been wiped away from these backward counties? Far from it. To what cause may the advance in the others be chiefly ascribed? Mr. Grey, in his Report of Northumberland Farming, tells us that it was owing to the migration of some intelligent men from their paternal property on the banks of the Tees into a district in Northumberland called Glendale, that all the good farming in that highly cultivated county had originated. And the late Lord Spencer, in a very interesting article in the Royal Agricultural Society's Journal, has informed us that from Mr. Brett refusing to give 5*s.* an acre for his land, which now usually produces nearly 4 qrs. of Wheat, Lord Leicester determined to take the farm into his own hands, and then commenced a series of improvements which has had such a beneficial effect upon that district, and on the agriculture of the country at large. When we see important events proceeding from such slight causes, we need not so much wonder that where these causes have not operated, agriculture, as an art, should have so much languished. We read in a clever production which has lately made its appearance, that farmers are not a reading set. A thorough knowledge of the "New Husbandry" is only to be obtained by reading, or by a personal inspection of the most approved methods. The days of prejudice are fast departing, and the eyes of men begin to be opened to the value of modern discoveries; but, notwithstanding this, there are many landed proprietors, and their subordinate agents, who still have a hankering after the old system, and who either cannot see, or will not take any pains to promote the advantages of an improved one. Difficulties, no doubt, there are in their way, from the instruments they have to deal with, but these difficulties are not insurmountable, and they ought to be encountered. The present race of farmers, in many parts of the country, are still sadly illiterate, ill-informed, and impoverished. This is a serious obstacle to any plan of high farming. Education is the source of all good, moral, and intellectual—as the child is trained, so will he go. It is in vain to expect any great performance when the intellects are obtuse from want of cultivation. Sir John Sinclair, in his "Scotch Husbandry," attributes much of the good farming in Scotland to the establishment of parochial schools. Numbers of Scotch farmers, also, were accustomed to travel, with a view of acquiring useful information, and of comparing their own practices with those of other districts. Thus by degrees farming came into repute in that country, and instead of its being considered a servile employment, as it is with us, it was followed, as an honourable profession, by the younger sons of men of family and fortune. But there is another almost insuperable obstacle to high farming in many parts of this country—which is, want of capital. The common calculation for stocking a farm, and all the numerous requirements necessary for cultivating it to advantage, is 10*l.* an acre. A pair of horses is wanted for every 50 acres of arable land. Where is the money to come from amongst a set of men who have scarcely means at command to carry on their own miserable system? In Scotland the country bankers had come forward to lend the farmers money; and Sir James Stewart, in his "Political Economy," goes so far as to say, that "to the banks of Scotland the improvement of that country is entirely owing." That they have materially contributed to it can be well understood, when it is considered that a vast expenditure is required on any one engaging in a new farming undertaking, and how small will be the return or rather clear profit in the early part of it in case the land is much out of order, and has been entirely worn out; in many cases the losses are great, and these can only be redeemed at the latter end of the term, provided that be of sufficient length. One great deficiency in many farming concerns is the very inadequate mode of making manure. Unless a very large quantity of this indispensable ingredient be made on a farm, it is utterly impossible that high farming can be attained. This manure, at a distance from a town, can only be raised by feeding, upon green crops, large stock. But without sufficient capital how is the stock both of cattle and sheep to be obtained? Mr. Caird on his farm of 260 acres feeds off every year 130 cattle, the same number being annually purchased to supply their place. About 150 sheep are also fed fat on Turnips during the winter. In most of the farms upon the old system not a single head of cattle is ever fed; and every means are taken to waste manure rather than to make it. With so many impediments in the way, it is almost a hopeless task to attempt to raise to the dignity of the higher order of farming those so long sunk in ignorance and sloth, or even to expect to compensate by greater gains for the losses sustained by the reduction of prices in the market. *Law. Rawstorne.*

A Six Years' Rotation, on a farm of 220 acres of arable land, adopted as the result of many years' practice, is submitted to the notice of your readers. Soil, strong loam on chalk, approaching to clay before amelioration. 1st year, Swedish Turnip and Mangold; 2d, Barley; 3d, winter Beans; 4th, Wheat; 5th, Clover and Italian Rye-grass; 6th, Oats. In fallowing after Oats for the root-crop, the rule is to plough deep, at least 9 inches, and a portion of the land is always subsoiled with the Deanston plough, and all or the greater part is always manured from the cattle yards before ploughing; also bone manure is drilled with the seed. The root crop being carried off the land, early preparation can be made for sowing the Barley, which is drilled at the rate of 6 to 8 pecks per acre. After harvest, the preparation for winter Beans begins by manuring for the whole crop. The Beans are drilled in every third furrow, after the plongh, with a barrow-drill, sowing about 2 bushels per acre. In the following season, and after the last horse-hoeing, some imperial border yellow or other good Turnip seed is sown between the drills of Beans. By means of a long seed machine (called Bennett's), the holes of which are stopped, except five, which are regulated so as to drop the seeds in the middle of the space between the drills; this is done when the hand hoes are going over for the last time. When the Bean crop is harvested, the Turnips are, as soon as convenient, horse-hoed and singled, and the after growth is astonishingly rapid; a portion of the Turnips are carried to the fatting cattle and sheep, and the remainder folded off on the land. The Wheat crop is then put in as fast as every fold course is cleared, at the rate of 1 bushel per acre.* At the last spring hoeing Clover and Italian Rye-grass are sown amongst the Wheat, by means of the above named Bennett's machine, with all its holes now open. This crop is partly cut up green and partly cut for hay, and is always cut twice; next follows the Oat crop, the last of the rotation, and 2 bushels are generally sown as early as the season permits; they are also well hoed. All the white straw crops are drilled 12 inches row from row, and the roots and Beans 27 inches; one ploughing serves for every crop, except the roots, and they have occasionally been drilled with only one ploughing, and the use of Kirkwood's grubber. The old rotation here was—1st, naked fallow; 2d, Wheat; 3d, Barley or Oats; and 4th, seeds, 2 years ley. The fallow requiring never less than 6 ploughings, oftener 8, whilst 6 ploughings has frequently served for the whole of the above rotation, exclusive of the Deanston. The advantages of the 6 course shift are a high acreable produce, complete pulverisation of the soil, at a reasonable cost for horse labour, and a crop every year. *W. Fowke, Red House, Hunley, Winchester.*

Thin Seeding.—What are the facts at issue between myself and Mr. Baker? Last year I grew, as I have asserted, a very prolific Wheat; I am likewise growing it again, and it will be grown in several parts of England also, and in two other quarters of the globe. I was applied to for it by very many gentlemen whom I could not supply; and in order that no misrepresentation, such as Mr. Baker insinuates against me, should be made, I gave away nearly as much as I sold; and what I did sell, though the price in every case was left to myself, I charged only the market price of other Wheat. I had a letter from a merchant, begging of me to let him have the whole, and saying that he did not regard the price. But Mr. Baker again has reiterated that it is "unfit for mealing purposes." I had a little made into flour, and some bread from it, and some other bread made from some very excellent white Wheat, are now before me, and I assert that the bread made from the Wheat which Mr. Baker condemns is the better bread of the two. I have also had pastry made from it, and never did I eat better. I have also an analysis of it, gratuitously sent me by a gentleman of eminence, who states that "it is unusually full of gluten." It is, moreover, the heaviest Wheat I ever grew in this neighbourhood. I beg the readers of the *Agricultural Gazette* to bear in mind that I publish this account of the Wheat purely on public grounds. I believe it to be an invaluable kind of Wheat, and I hope to see its cultivation become general, and more especially as it must be seeded exceedingly thin. Let me also again repeat, that I could last harvest find roots from single grains having produced nearly 4000 grains, and I have not the least doubt whatever but next harvest I shall be enabled to do the same. With reference to my esteemed friend, Mr. Mechi, we understand each other very well; or if not, he is able to fight his own battle; and the same may be said of my friend, Mr. Thedam. In conclusion, I must add a word or two on thin-seeding, as I fear I am not generally understood. My attempts have been to ascertain the minimum quantity of seed for Wheat, and not the maximum quantity. I have also been careful to observe, that I have never advocated a definite quantity of seed for every kind of Wheat and for every kind of cultivation, nor for every other kind of grain; but just the reverse. On one field I might put two or more pecks of seed, when, on another, I might put but one. I should also put twice the quantity of one kind of seed Wheat that I should of another, and perhaps more. In my parish there are now fine fields of Wheat seeded with 3 pecks and 4 pecks of seed; and last year I think the best crop was from the smallest quantity of seed. But everywhere less seed is being used; all farmers, and even Mr. Baker himself, say they use less seed than formerly, and there is no doubt but the quantity will diminish as knowledge becomes more general: on no land can more than half a bushel of seed Wheat come to perfection; all the remainder decays, or does mischief to the crop, from a lack of scientific cultivation. *G. Wilkins.*

* The Wheat crop put in this season has cost within a fraction of 20*s.* per acre, including ploughing, &c., and 1 bushel of Wheat, at 6*s.* per bushel.

Societies.

Highland and Agricultural (General Meeting), *Jan.* 8.—The Duke of Roxburgh in the chair. *Admission of Tenant Farmers.*—Among various reports received, was one on this subject by the Directors, recommending that tenant farmers, who are members of any local agricultural association, should be admitted to the Society on a reduced subscription, was read. The report states that the subject has been for some time under the consideration of the Directors, and that the Secretary had been in communication with the farmers generally in regard to it, and proceeds as follows: "The list of the Society's members at present comprises 2707 names, of which only 239 are those of tenants. This is, unquestionably, a very small proportion, and does not indicate that amount of support which might be looked for from a body so numerous and so intelligent as the farmers of Scotland. It indeed might induce a casual observer to infer, that the Society does not command their confidence, or that, uninterested in its prosperity, they purposely stand aloof from it. That this is not the case the Directors are well aware. They have ample evidence of the interest which is taken in the Society by agriculturists of all classes; and through the medium of local associations and local shows, there is constantly maintained, between it and the farmers generally, a friendly intercourse and connection. The Directors are disposed to attribute this comparatively small number of tenant members to an idea which at one period was prevalent, and is not yet altogether exploded. The Society was too much regarded as exclusively a landlords' body; it was conceived by many that tenants were inadmissible to a share in its direction, and that though not debarred from becoming members, they were scarcely expected to do so. It is unnecessary now to explain that this feeling was unfounded; it is the boast of the Society, as a national body, that it represents every class connected with the agriculture of the country, and it is evident that, without the co-operation and aid of all, and more particularly of those practically engaged in farming, it cannot command that position which is so requisite for the furtherance of its important objects. Within the last few years several tenant farmers have become Directors of the Society, and, independently of the advantages afforded by their knowledge and experience, their presence at the Board has tended to dispel the impression which has been alluded to, and to induce their brother farmers more generally to rally round the Society. The Directors think that this would still farther be promoted were the present subscription reduced, as the Society could not more emphatically express its desire to include in its ranks the farmers of the country, than by inviting their adhesion on terms more favourable than those accorded to other parties. Such an advantage, besides, would be but reasonable, and no more than what the tenantry have a right to expect. Their connection with land generally is neither so extensive nor so permanent as that of a proprietor, and they should not, therefore, be called upon to contribute in an equal degree to the support of the Society. It seems somewhat incongruous, that a tenant, paying perhaps a rent of moderate amount, should not have it in his power to become a member on terms more favourable than those imposed on the largest landowner in the country. In recommending a reduction, however, there is one limitation which the Directors would suggest. It may be apprehended that were the farmers more generally to join the Society, they might be withdrawn from local associations, and that the support now given to these useful bodies might be interfered with. This the Directors do not anticipate; but as they cordially acknowledge the great advantages conferred by local societies on agriculture, they would be the last to promote any measure calculated to detract from their efficiency. So far from weakening, they would endeavour, by means of the proposed change, if possible, to strengthen their hands, and for that purpose they would restrict the privilege of the reduced rate to those tenant farmers who are members of some local society." The report proceeds to recommend that the annual subscription to tenant farmers shall be 10*s.* instead of 1*l.* 3*s.* 6*d.*, with the power of redemption at 5*l.* 5*s.*, instead of 12*l.* 12*s.* *Chemical Department.*—Professor Gregory reported that the Chemical Department of the Society continued to be conducted by Dr. Anderson to the satisfaction of the committee of superintendence, and of the Directors.

Dr. Anderson said he should not detain the meeting by entering into any extended details regarding the business of the laboratory. Since he had last the duty of reporting to the Society, they had been closely occupied in the laboratory with the performance of analyses of different sorts; and during that time about 70 analyses had been made for different parties; many of these were extremely complex and minute investigations, and had occupied considerable time. This did not, however, give any idea of the whole amount of work done, as he had also been engaged on several extensive investigations of subjects of general interest to the agriculturist. One of these was a set of very minute analyses of the Wheat soils of different districts of Scotland, which were intended to determine the standard constitution of such soils. These analyses were now in progress, and he hoped shortly to have an opportunity of laying the results before the Society. He was also engaged in a series of analyses of Turnips, grown with different manures and from different localities, for the purpose of determining the feeding value of that important root under different circumstances. Another subject now under investigation was the feeding value of our different grains, and of all the substances used as food for cattle. In this some progress had also been made, but at the present moment it was entirely laid aside, in order that all the time possible might be devoted to the Turnip analysis, which required to be set in operation without any unnecessary delay. The matter, however, was not lost sight of, although not at present under active investigation. On the whole, a very considerable amount of work had been got through in the laboratory; and more would have been done, had it not been for the interruption occasioned by their removal to the new laboratory, which had occupied much more time than was anticipated. He had not brought the first year of his official connection with the Society to a close without having experienced considerable difficulties in the management of the laboratory; these, however, he trusted, were now overcome, and he hoped that the experience of the past year would enable him in future to perform the duties of his office in a manner more satisfactory both to himself and the Society.

Reviews.

The "Present Prices." By the Rev. A. Huxtable, Rector of Sutton Waldron, Dorset. Ridgway, Piccadilly, London.

As a New Year's Present to the agricultural world, Mr. Huxtable's pamphlet will be useful to our readers, as furnishing food for much useful reflection to them at least.

Notwithstanding some important typographical errors, which confuse the calculations, but which we hope to see speedily corrected in an enlarged edition, we must repeat that we consider this work a most valuable addition to the agricultural literature of the day, whether it be to those who, contented with present prices, receive gladly any hint by which to carry out their pre-conceived opinions, or, on the other hand, for the interests of that very numerous class who loudly profess their inability to cope with a state of things which they desire to remedy by the direct interference of the legislature, and which our reverend author thinks may be encountered more readily and surely, "by the employment of our own individual resources, exertions, and arrangements."

It must be evident, on a moment's consideration, to every practical farmer that the discussion is not whether he can produce profitably Wheat at its present price of 5*s.* a bushel, or meat at 5*d.* a pound; that higher prices than these may be more agreeable to him, and more advantageous, is totally beside the question. If he has made up his mind that present prices cannot be rendered remunerative, he must either discontinue his business, and seek some other livelihood, or submit to carry it on at a loss, more or less ruinous, until better times, come how they may, whether by protection or otherwise, shall at last reward his labours.

Turning then from this class, Mr. Huxtable addresses himself to the attention of those who are prepared to consider, "By what system can we most profitably manufacture Wheat and meat at present prices?" to whom he says, "Unlike most of my farming friends, I have long been seeking out consolation from the better management of my own farm."

To many of the numerous and interesting topics alluded to in this pamphlet, we shall not now advert, being convinced, from the recollection of the popularity of a former publication of the reverend author on agricultural chemistry, that it requires no eulogium on our part to obtain for the present work a similar amount of the public attention; but we recommend it more specially as bearing "on the important subject of green crops, and the two distinct questions therein involved: firstly, what is the cost of their production? secondly, what is their value, when consumed on the farm, estimated by the increase of live weight in animals of known value, and by the worth of their residue as manure?" (P. 21.) In resolving these two questions Mr. Huxtable makes some valuable remarks, too long for quoting, and which, therefore, we will not injure by curtailing, but which he sums up in the following statement:

Dr.	£	s.	d.
Wheat crop	4	19	4
Swede crop	5	12	4
	£10	11	8

Cr.			
Beef (produced by 20 tons of Swedes at 17 lbs. to the ton, 340 lbs. at 5*d.* per lb. = 1700 pence per acre)	7	0	0
Wheat, 32 bushels at 5*s.*	8	0	0
	15	0	0
Deduct cost	10	11	8
Leaving	£4	8	4

to satisfy the interest of the other capital not yet specified, chiefly 7*l.* per acre for stock, which, at 10 per cent., would amount to 1*l.* 8*s.*, and thus leave, even at the dreaded prices so familiar to our ears, a margin of about 30*s.* per acre for each year.

How far it may be in the power of persons less favourably circumstanced than Mr. Huxtable, to obtain from their crops a like amount of value, is a very serious consideration. We must however add that he supports his conclusion, not by arbitrary estimates of what ought to be done, or of what he conceives may be done under such or such circumstances; but by carefully tested experiments carried out by able and trustworthy men, and as he goes into much detail both of "facts and figures," we give him much credit for the fairness and impartiality with which he arrives at his results.

That the green crops under the "alternate system" are too frequently regarded as mere food for their more noble and more highly prized successors, is an evil which we cannot but deplore. How commonly do we see the half-gnawed bulbs of Swedes lying about the fold, as if they were of no other use than to keep life in the sheep, which deposit the nourishment of the next crop of corn. How often too is the whole produce of the Clovers preserved at great expense and risk in summer, squandered in the winter's byre and cattle yard, merely as a medium of converting through the agency of manure-making cows, the surplus straw into *soi-disant* "muck," to be applied solely to the preparation of the succeeding Wheat crop. To this system it is that the remarks of Mr. Huxtable apply most forcibly, but as our own have already extended to an undue length, we shall postpone until some future day the consideration of this important branch of his subject.

Farm Memoranda.

Ellel Moor.—Ellel Moor was inclosed by a special Act in 1756, laid out into farms, and brought under cultivation. Draining and trenching have both been carried on from time to time to a limited extent, but not on a regular or fixed system. The soil is from 2 to 5 inches deep, growing in its natural state—Rushes, Whins or Gorse, Alder bushes and Heather; it lies upon a yellow bastard clay, full of stones, and frequently containing large quantities of oxide of iron, making it very hard to cut for drains; the rock is the millstone grit; the land varies so much, that there are hardly 2 acres exactly alike. I took possession of the farm, which consists of 77 statute acres, in November, 1843. It has an excellent house and good farm buildings. The tenant had been on it for 22 years, at a rent of 44*l.* per annum; but for want of energy, and from bad management, he had brought himself to a stand still. I commenced draining, trenching, and subsoiling. I did not cut any drains the first year on the thorough-draining principle, not feeling sufficiently informed of, or confident in, the system; since then I cut them 30 inches, and latterly 3 feet deep, at 7 yards apart, upon Mr. Smith of Deanston's plan, and find them answer extremely well. I occasionally used 1½-inch tiles, and at other times, from the quantity of stones there are, sough-drains, with broken stones on the top. I have been successful in most of my crops: in 1845 I gained the premium for the best crop of Swedish Turnips at the Lancaster Agricultural Society's Show, competing with the best lands in the neighbourhood of Lancaster—Burton and Milnthorpe; the crop weighed 24 tons, topped and tailed, to the statute acre. In 1846 I had 8A. 3R. statute of Turnips, Cabbage, Mangold, and Potatoes; the field was thorough-drained, but neither trenched nor subsoiled; it was formerly two fields, and I expended 75*l.* in draining, levelling fences, picking stones, &c.; and I may here mention that the value of the land, as made by two most experienced land-valuers at the time I bought it, was 6*s.* per acre for one field, and 8*s.* per acre for the other, at 26 years' purchase. The crop was not weighed; but I sold by auction 2A. 3R. 35P. statute of Swedes, which realised me 47*l.* net towards the outlay of 75*l.*, leaving me above 5 acres for my own; last year I mowed a most excellent crop of Rye-grass; so that I think it has nearly redeemed itself, and is in a very different condition to what it was. In the winter of 1847 and spring of 1848 I trenched and drained 6 acres of old ley, and trenched 4A. 1R. 35P. of Oat-stubble for green crops, the account of which I give below. The plan I proceed upon is to set my trenching in beds of 7 yards wide, the fall of the land, a drain being cut on each side of the bed. I provide, in the first instance, stones for the first two or three drains, and then commence trenching to the depth of the soil only, breaking up the subsoil to the depth of 10 or 12 inches with a pick, and throw all the stones on the top of the trenched land. This year I have used strong forks about 7 lbs. weight, with a projection at the back in this form (T), in order to give more leverage. I prefer them to the pick, being, I think, more effectual, and easier for the men. Whilst the trenching is going on, I have other men cutting the drains in the entrenched land, and the stones on the trenched land are wheeled in barrows to the drains, the land abounding so in them that they have seldom to wheel them more than 14 or 20 yards, so that I hardly ever have a horse and cart in the field. I believe this plan to be the cheapest and most effectual for my land, and I have given up the subsoil plough; the trenching is done by the customary measure of 7 yards square to the rod, or fall, as we call it; the price 8*d.* to 9*d.*; at which price a good man can earn 2*s.* to 2*s.* 3*d.* per day; the drains are cut by the rood of 7 yards long, 3 feet deep for stone soughs at 7*d.*, and 30 inches deep for pipe-tiles at 5½*d.*; the soughs are made, tiles laid, and stones filled, and drains filled up by day-work.

"Expense of thorough draining, at 30 and 36 inches deep, and 7 yards apart, trenching, &c., 6 statute acres of old ley on Ellel Moor:

Grubbing Whins ...	£2	5	0
„ Alder-bushes ...	1	12	9
Trenching 595 falls of 7 yards square, at 8*d.* ...	19	13	8
Cutting 685 roods of drains at 6*d.*, tiles, stone-breaking 258 cubic yards, laying tiles, filling up drains, &c. ...	45	18	11
Labour, getting up large stones and Alder-bushes, not let by contract, &c. ...	10	0	0
	79	10	4

I removed 920 one-horse cart-loads of stones from the land after it was drained and trenched, which I sold to the Surveyor of Roads, and which paid for the removal, the road being alongside the field, besides 70 loads of good rubble walling stones, from the large stones we had to break up with hammers and wedges. I sowed the field with Scotch lean Oats, and gave it 2 cwt. of Peruvian guano to the acre; it produced 197 thraves, the band being made small on account of the wet season; the straw was strong and full, but I have not weighed it for thrave. In corn it gave 44½ bushels per statute acre, of 39 lbs. to the bushel; and having made meal several times, I find it gives me four loads of 240 lbs. to the load per statute acre. I am now ploughing it for a second crop of Oats with a hand-dressing, probably superphosphate of lime; and the condition of the land is most satisfactory.

From the 4A. 1R. 35P. of Oat-stubble which I trenched, I removed nearly 500 one-horse cart-loads of stones, and sold most of them to the roads. I sowed it with Swedes, Mangold, Carrots, and a few Potatoes; and considering the wet summer, I had a very fair crop of Swedes, about 18 tons to the acre; and with what I have sold and have to sell, I shall more than twice cover the expense of trenching. For Mangold Wurzel on poor lands like mine, independent of the muck put into the stitches, I strongly recommend the practice of dibbling in with a trowel, every 10 inches, a prepared compost, and placing the seed immediately upon it. The compost I made last year consisted of bones, horse-feet parings from the blacksmiths' shops, hen-manure, which I carefully save, and ashes, or, still better, refuse charcoal: these were put into a heap under cover, and well wetted with tank liquid, and left to heat for two months. I have a light wooden roller, the same as a garden roller, 30 inches in diameter, with three strips of wood projecting about an inch railed on at every 10 inches longitudinally; it covers two stitches at once, 30 inches between each, and is drawn by men, and consequently levels to the top of the stitch, and leaves a mark every 10 inches. The compost is put into buckets, and with a garden-trowel the labourer takes out a trowelful of earth and replaces it with a trowelful of manure. The cost of doing this per acre is from 10*s.* to 12*s.*, if done with men: could women or boys be had, it would be less. I steep my seed in liquid manure 24 hours, and put in a bag two or three times larger than required, in order to be able to turn the seed and lay it on the midden in a gentle temperature from four days to a week. The bag must be turned every day, and great care taken not to place it in too hot a berth. Last year my hind overheated and destroyed the seed, and the consequence was I had at the third week's end to re-dibble fresh seed; notwithstanding which I had nearly as fine a crop as any I saw in the better land in the neighbourhood of Lancaster, owing to the compost and liquid manure. I dibble the seed in with the finger and thumb, placing three seeds at a little distance from each other in the compost at every 10 inches, and cover lightly with the finger. I have thus had it up in a week from the time of sowing. For Carrots I recommend, after they are weeded, and about 2 inches high, to give them, if the weather be damp, 1 cwt. of guano and 1 cwt. of gypsum per acre, sown on them early in the morning. I did so last year upon my crop, which I thought worthless, and the effect was astonishing.

Rotation.—My general rotation is—of old tough ley, two crops of Oats, both hand-dressed; two Turnips, Mangold, drilled Beans, Potatoes, Cabbages, and Carrots; three Oats, with Grass seeds, either mown or left to pasture three or four years; if mown, ploughed up earlier. I do not, however, follow strictly any rotation, but depend entirely upon the condition the land is in. I have two liquid manure tanks, and attribute my success in growing green crops mainly to its use upon the first appearance of the plant. My common Turnips were sown very late last summer; and in applying the liquid manure when in seed-leaf several rows were missed. The result was that I had not one-third of a crop on that portion, the fly destroying them; and what remained, from the want of a stimulant and ready concocted food—liquid manure—made very poor progress, the season being late.

Manure.—Since 1843-4, my first two years, I have bought no heavy manure, and very little guano, about a ton to 25 cwt. per annum. I find it the most advantageous to make the manure on the premises, by

buying Linseed and straw for bedding, and laying on as many cattle in the winter as I can accommodate for feeding. I have never bought a single ton of horse or cow manure, only night-soil from the factories, which nobody thought much about when I first commenced.

Cattle.—The greatest number of cattle kept by the last tenant were in summer never more than five milch cows, and about four or six head of young stock, a pig, and two horses. In 1846 I milked 15 cows, besides having young stock, three horses, and three brood-sows and store-pigs. Last summer I milked 12 cows, having rather more under the plough; and this winter I have nine milch cows, two two-year olds, and five fat beasts in my shippon, five yearling calves, one back-end calf, two nine-months-old bulls, three horses, two brood-sows, and eight store-pigs. I have grown Italian Rye-grass, and mown three crops; and now that the land is in better condition for it, I shall sow it again. I grew a very heavy crop of tick-Beans in 1847, broadcast, and well mucked with farm-yard manure. The extent of land was a customary acre, or 1A. 2R. 20P. statute, and I had 16 loads, of 280 lbs. to the load, and 147 lbs. *Richard Hinde, Journal of the Royal Agricultural Society of England.*

Miscellaneous.

Transplanting Swede Turnips.—I prepare a bed, and sow it early in rows about 8 inches apart, and thin out to 4 or 5 inches in the row. An acre will thus transplant about 20 or 25 acres. As the Vetches are mowed off, the space cleared is ploughed, well worked, dressed with 2 cwt. of the compost, and ridged up. As this work proceeds the plants are being prepared, and are planted while each drill is damp and fresh. As dispatch is only produced by division of labour, the process is as follows:—One party, No. 1, pulls the best plants, keeping them "heads and tails," and carries them to another party, No. 2, who sits at the end of the ground to be planted, and who nips off the slender part of the tap-root and the upper part of the leaves, laying them in a basket, also "heads and tails;" No. 3 carries them up the field to No. 4, who lays them in the drill, with the leaves towards the planter's left hand; No. 5, who must be a man or boy, that, striding across the drills, no petticoats may interfere with the plants just put in. I never use the dibbling-stick, which, in heavy land, only hardens the inside of the hole, but the planter is furnished with a light, hollow, half-round steel trowel, with which, in his right hand, he lifts up a portion of soil, while with his left he puts the plant in a slanting direction below it; then drawing back the trowel, the soil falls loosely on the plant, and a short stride of one leg takes him to the next. The proportion of labour for pulling and topping depends on the size and position of the plants; but one layer will do for two ordinarily quick planters, though my bailiff, whom you saw, can transplant a statute acre in the day. I usually transplant from 15 to 30 acres per annum, and have raised, according to the examination of the Inspector of the Liverpool Agricultural Society, 26 tons 4 cwt. per acre; but the land must be "mucked heavily, ploughed deep, and weeded clean," which I consider now, more than ever, the farmer's motto. *Mr. Neilson, Journal of the Agricultural Society.*

Calendar of Operations.

JANUARY.

SUSSEX FARM, *Jan.* 21.—The snow in this part has nearly disappeared, but since Saturday the weather has changed again to frost. Our teams are engaged ploughing Oat stubble for Beans and Peas, also ploughing two years seed lea for Oats. If the weather allows, the ploughs will continue at work; if too hard for that, we shall cart earth from road-sides, ditches, banks, and headlands, into heaps, to mix with lime, to be applied again to the land before the Turnip crop is sown. Men are engaged ditching, hedging, filling earth into carts, turning mixings, and threshing Oats and Peas. In speaking of threshing, I may state the difference between machine and hand threshing. The last stack of Wheat we threshed was the crop of 1848, threshed in October 1849, by machine; the stack was got in by truck and temporary railway. The stack yielded 50 sacks (4 bushels to the sack). Cost of getting in and threshing the same, 1*l.* 5*s.*

Threshing by manual labour, 50 sacks of Wheat, at 1*s.* 9*d.* per sack, would be	£4	7	6
Men and horses getting in stack and storing in barn	0	18	0
Expense by hand	5	5	6
Ditto by water power	1	5	0
Profit for machine	4	0	6

If the money saved by machinery was applied in draining, it would increase the food for both man and beast; instead of being an injury to the labourer it would be a general good. *J. B.*

Notices to Correspondents.

AMMONIA: *R G.* 100 gallons of undiluted urine will furnish during decomposition about 40 lbs. of carbonate of ammonia; to convert that into sulphate of ammonia, a *fixed* salt, 40 lbs. of sulphuric acid are needed—a quantity contained in 55 lbs. of liquid acid of specific gravity 1 8.

ARSENIC: *T H* says, "I see that your correspondent 'J. B. J. N.' advocates the plan of soaking Wheat in a solution of arsenic. Perhaps he is not aware that Wheat so treated will poison the game, and that the game so poisoned contain a sufficient quantity of arsenic in the flesh to affect very seriously, if not to kill, any animal partaking of them. This was fully established by experiments some months ago, which were published in the papers at the time, and for the truth of which I can vouch."

BACON: *A B.* Next week.

BOOKS: *F.* Some of the descriptions of selected farms, published by the Society for the Diffusion of Useful Knowledge, contain the details of dairy management. Their work, "The Ox," also has chapters on the dairy.

BOWERS' DISSOLVENT: *W L C.* If any of our correspondents are using, or have ever used, Bowers' Dissolvent for preparing grain (instead of grinding into meal), for feeding purposes, we should feel greatly obliged if he would inform us whether or not it answers the purpose.

BUTTER: *L R S* asks for the cause of his butter being very bad both in texture and taste? The cows are fed on Mangold Wurzel and Beans. Scrupulous cleanliness is preserved in all the dairy utensils, but the butter is short, tough, and almost rancid. The cream is only churned once a week. Can it be owing to the Beans? [We should think not]

CUNNINGHAM ACRE: *V A N.* The Irish acre is 7840 square yards —3000 yards more than the imperial measure. What is the Cunningham acre?

FIXATION OF AMMONIA: *W E.* 100 gallons of undiluted urine will give off so much ammonia as to require 86½ lbs. of gypsum, 139 lbs. of green vitriol, or 123 lbs. of Epsom salts to furnish sulphuric acid to "fix" it. The Epsom salts is the best to use; the iron salt, the worst.

FLAX: *A Subscriber at Reading.* Apply to Messrs. Storar & Co., Belfast.

GRASS SEEDS: *V A N.* For improved deep mossy or boggy soil, sow, per acre, without a crop: Agrostis stolonifera, 2 lbs. Alopecurus pratensis, 2; Festuca duriuscula, 2; Lolium perenne, 6; L. italicum, 3; Phleum pratense, 2½; Poa trivialis, 2½; Tritolium repens, 6; Lotus major, 1½; total, 27½ lbs.; and one bushel of Rye.

HARD WATER: *A B* may make his hard water soft, for use to clean a carriage, by precipitating the lime it holds in solution, and if the solution be one of *caustic lime*, as under the circumstances is possible, to add a little stale urine would answer the purpose.

LIQUID MANURE: *A F.* Mix it with charred vegetable matter; that is better than ashes, which, being generally alkaline, will hinder the fixation of the ammonia, to which the putrefaction of the ammonia gives rise.

LIME AND MUD: *B A, Cantab.* Lay it in alternate layers, and let it remain till next winter, turning it over in the meanwhile. You are not well advised not to add the lime till just before using it. Lime ought not to be mixed with stable manure, and the objection holds good for all animal manures; for instance, with night-soil salt may be usefully added to the manure heap. It is good for Grass land in inland places. Guano is the best artificial manure for Grass land—the best purchaseable manure next to stable manure. Pure horse-droppings are of more value than when mixed with straw. Pay the old man 8*d.* a large wheelbarrow-full for the horse-dung.

OVERHANGING HEDGES: *Horncastle.* You may enforce the removal of overhanging branches; but you had better consult your solicitor, if a remonstrance is ineffectual.

PHEASANT AND DOMESTIC FOWL: *Our correspondent L V R* asks if any of our readers, who intended during last summer to try to procure half-bred birds or "peros" from the pheasant and domestic fowl, have any favourable results to relate? He, after much trouble for the purpose, was deprived by an accident, or rather a series of accidents, from procuring any chicks. However, he is fully convinced, from what he has observed of the cock pheasant when confined in pens with the fowls, that it is vain to expect the birds to breed, except in very rare instances, when in confinement. The pheasant will not rest (although bred up in confinement from the shell) after he is a year old; the birds therefore should be at liberty, but strictly isolated.

LIQUID MANURE: *Lancashire Farmer.* If you have much to distribute, the pump and pipes would suit your purpose. If little, the water-cart will be cheaper.

Markets.

COVENT GARDEN, JAN. 26.

Vegetables, though generally somewhat dearer, are nevertheless pretty well supplied. Fruit for the most part is sufficient for the demand, except good Pears and Apples, which are very scarce. Hothouse Grapes and Pine-apples are good for the season, Filberts and Walnuts are abundant, and Chestnuts plentiful. Oranges and Lemons are abundant, and there are now some good Seville Oranges in the market. Amongst Vegetables, Turnips and Carrots are a little scarcer. Cauliflowers and Broccoli the same. Potatoes have altered little since our last account; there are some foreign ones in the market, which fetch from 50*s.* to 70*s.* a ton. Lettuces and other salading are dearer, and so are Mushrooms. Some French Beans, Asparagus, Seakale, and Rhubarb may be obtained; and some green Peas, not over fresh looking, have just arrived from Lisbon. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

POTATOES.—SOUTHWARK, Jan. 21.

The Committee report that there have been but few arrivals since our last report, shipping from the Continent being much retarded from the severity of the frost. The demand is not good, and it is with difficulty higher prices for French are obtained. The following are this day's quotations:—Yorkshire Regents, 90*s.* to 120*s.* per ton; Wisbeach do., 70*s.* to 75*s.*; Scotch do., 65*s.* to 75*s.*; French whites, 65*s.* to 70*s.*

SMITHFIELD, MONDAY, Jan. 21.

We have about an average supply of Beasts, and trade continues about the same as of late. Our top quotations are not very freely given, and some middling descriptions remain unsold. The supply of Sheep is not large; trade is, however, very dull at rather lower prices on the average. The number of Calves is greater than the demand, and lower rates are taken. From Holland and Germany we have 200 Beasts, 380 Sheep, and 112 Calves; from France, 10 Beasts; from Norfolk and Suffolk, 1700; and 920 from Leicester and Northampton.

Per st. of 8 lbs.—*s d*	*s d*	Per st. of 8 lbs.—*s d*	*s d*

		Pigs	3 4 — 4 2

Beasts, 3334; Sheep and Lambs, 19,800; Calves, 153; Pigs, 205.

FRIDAY, Jan. 25.

We are but moderately supplied with Beasts; the demand is, however, so small that lower prices are submitted to, and many of inferior quality remain unsold. The supply of Sheep is small and very few are wanted; Monday's quotations are scarcely maintained. Good Calves are very scarce, and readily make 4*s.* 8*d.*, but inferior are not much dearer. From Holland and Germany there are 7 Beasts, 100 Sheep, and 33 Calves; from Scotland, 240 Beasts; Leicester, Northampton, and Lincoln, 100; and 127 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3 8 to 4 0	Best Long-wools .	3 6 to 3 8

		Pigs	3 4 — 4 4

Beasts, 714; Sheep and Lambs, 1860; Calves, 132; Pigs, 200.

HOPS.—FRIDAY, Jan. 25.

Messrs. PATTENDEN and SMITH report that the market continues the same as for some time past, fine new Hops being very scarce. It appears from returns just published, that from the 6th July to the 15th December last, only about 77 tons of foreign Hops have been entered for home consumption, equal to only about 700*l.* old duty; consequently holders of Hops have nothing to fear under this head.

MARK LANE.

MONDAY, JAN. 21.—There was a small supply of Essex Wheat to this morning's market, but fair of Kent; the former was disposed of on terms barely equal to our quotations of this day se'nnight, but the latter could not be cleared excepting at a decline of 1*s.* to 2*s.* per qr. Foreign was in limited demand, but the sales of too retail a character to allow of any alteration in prices.—The value of Barley is unaltered.—Beans and Peas are a very heavy sale.—Oats are not lower in price, but sales not extensive.

FRIDAY, JAN. 25.—The arrivals of grain during the week have been moderate. To-day's market was thinly attended, and the amount of business transacted small. The value of all grain remains without alteration from Monday.—Floating cargoes of Indian Corn continue in request, and 30*s.* cost freight has been made for Galatz.—The Flour market remains inanimate.—The Wheat trade still continues very depressed, and prices in many of the provincial markets have further declined 1*s.* to 2*s.* per qr. The tendency in the value of spring corn is also downwards, and English Barley in some of the country towns has been sold at very low rate, viz., 21*s*,, 22*s.* and 23*s.* per qr. The flat accounts from this side appear to have no influence on purchases throughout the Baltic, where former prices continue to be well supported.

LIVERPOOL, TUESDAY, JAN. 22.—The arrivals of Wheat this week are to a fair extent, those of Oats, Oatmeal, Beans, and Indian Corn moderate. We had another inanimate market to-day. The purchases of Wheat were in the merest retail way, and last Tuesday's prices may be considered as weaker. There was very little inquiry for Oats or Oatmeal. Barley and Peas were each easier to buy.

Second Edition, Revised and Enlarged, price 4s. 6d.,

RURAL CHEMISTRY:

An Elementary Introduction to the Study of the Science in its Relation to Agriculture.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honorable East India Company's Military Seminary at Addiscombe, &c., &c.

PREFACE TO THE SECOND EDITION.

"In preparing a Second Edition of this little book, the opportunity has been taken of correcting several errors which the First Edition contained. The whole has been carefully revised, and such additions have throughout been made, as the advanced state of knowledge rendered necessary. In particular, the Tables of Analyses have been greatly extended, by the addition of the latest and most complete Analyses of almost all those plants which are cultivated as crops, as well as of the principal substances employed as manure."

CONTENTS OF THE VOLUME.

ACETATE of lead
Acetates
Acetic acid
Acid, acetic
Acid, benzoic
Acid, carbonic
Acid, citric
Acid, humic
Acid, lactic
Acid, malic
Acid, muriatic
Acid, nitric
Acid, oxalic
Acid, phosphoric
Acid, pyroligneous
Acid, silicic
Acid, sulphuric
Acid, sulphurous
Acid, uric
Acids
Acids, organic
Acids, test for
Action of plants on the air
Active principles
Adulteration of guano
Affinity, chemical
After-damp in mines
Air
Air contains carbonic acid
Air contains water
Air, inflammable
Air necessary to life
Air, its composition
Air resists compression
Alabaster
Albumen
Ale contains carbonic acid
Alkali, test for
Alkali, volatile
Alkalies
Alkalies, vegetable
Alloys
Almonds
Alum
Alumina
Alumina phosphate
Alumina, silicate of
Alumina in soil, use of
Aluminum
Aluminum, oxide
Ammonia
Ammonia absorbed by charcoal, &c.
Ammonia, carbonate of
Ammonia, fixing of
Ammonia, muriate
Ammonia, phosphate
Ammonia, sulphate
Ammonia, urate of
Ammoniacal liquor

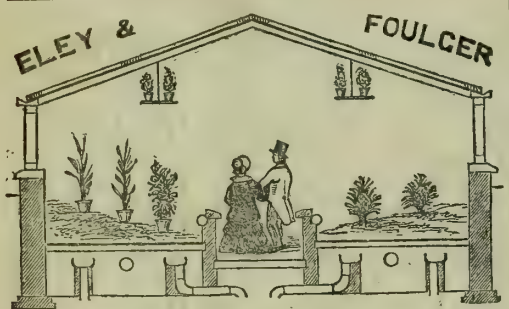
PUBLISHED AT THE OFFICE OF THE GARDENERS' CHRONICLE, 5, UPPER WELLINGTON STREET, STRAND, LONDON;
AND MAY BE HAD BY ORDER OF ANY BOOKSELLER.

TO NURSERYMEN AND OTHERS.—BRIGHTON.

TO BE SOLD, OR LET, under peculiar circumstances, and upon very advantageous terms, a series of Forcing and Succession GRAPERIES, PEACH and PLANT HOUSES, upon which a large sum has been expended to bring them into a high state of bearing. To a purchaser, any reasonable accommodation will be given for payment.—Apply to Mr. PARSONS, Auctioneer and Estate Agent, 30, Marine-parade, Brighton.

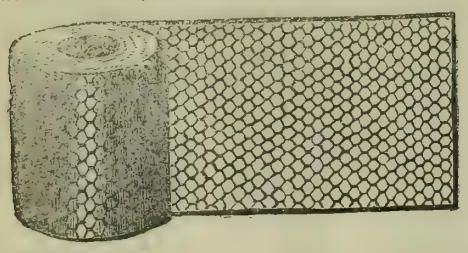


HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 130 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.



HOT-WATER APPARATUS MANUFACTURERS, HOTHOUSE AND IMPROVED PIT BUILDERS, beg to inform the nobility and gentry they are now enabled to supply their DOUBLE SADDLE CAST-IRON BOILERS, portable, with Ash-pit, Furnace Doors, Bars, and Cast-iron Smoke-conductor, the whole complete, without brickwork, being more durable than copper or wrought iron, and surpasses all others. These Boilers, placed inside the house or pits, with furnace doors outside, require no stoke-hole, and prove the most economical mode of heating. 4-inch best Hot-water Pipe, 1s; 3-inch, 10d.; 2-inch, 8d. per foot. Tank work 1s. 9d. per foot. Superior Valves, and all other connections, equally low. Buildings, or Hot-water Apparatus, can be supplied and arranged so that any gentleman's labouring man can fix them, or our own services may be had at very trifling expense. Can be most highly recommended by several noblemen and gentlemen, for whom the most complete buildings have been erected. The trade supplied. Estimates free.

*** Boilers of every description supplied.

Address, City-road, near the Toll-gate, London.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d. per yard	30 inches wide	7½d. per yard
18 " "	4½d. "	36 " "	9d. "
14 " "	6d. "	48 " "	1s. "

Galvanised do., 1d. per foot extra.

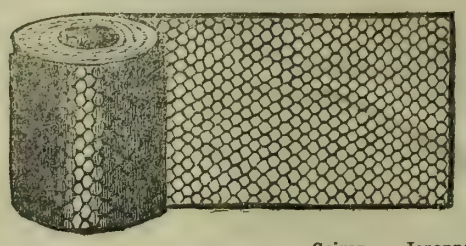
Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

NEW WORK ON GARDENING AND BOTANY.

On the 1st of March will be published, price 2s. 6d., No. 1. of

PAXTON'S FLOWER GARDEN.

EDITED BY DR. LINDLEY AND JOSEPH PAXTON.



AND ILLUSTRATED BY HIGHLY FINISHED PLATES AND WOODCUTS.

This Work, for which Monsieur CONSTANS, a French Botanical Draughtsman of great taste and skill, and a pupil of Mons. Decaisne, has been expressly engaged, will be confined to the proper business of an illustrated book, namely the representation and description of all new plants which may appear in gardens. The species which are of most importance will be illustrated by coloured plates, one species or genus only to a plate, with a leaf or more of letter-press, explaining the principal scientific and horticultural facts which belong to each plant. The species of less importance will be treated of more briefly, and will be illustrated when necessary by copious woodcuts and vignettes. The object, in short, will be to combine Scientific Botany with Gardening, and exact delineations of plants with pictorial effect. It is believed that by such means this periodical will not only be indispensable to the BOTANIST and GARDENER, but be also a mine of invaluable hints by which the ARTIST and MANUFACTURER will be able to profit.

It is not intended to admit any other kind of matter than such as is now described. All special treatises on cultivation, and all disquisitions respecting subjects incidental to gardening, will be transferred to the *Gardeners' Chronicle* and similar periodicals, in which there is ample space for such discussions, and to which they have now become better adapted than to a pictorial work.

London: BRADBURY AND EVANS, 11, Bouverie-street.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 2½-inch wide ...	7d. per yd.	5d. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG), MANUFACTURERS OF IRON AND WIRE WORK, &c., 22, PARLIAMENT-STREET, WESTMINSTER, LONDON; CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL; 128, HIGH-STREET, EDINBURGH; and 32, ST. ENOCH-SQUARE, GLASGOW, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3	15 0
Do. of 100 yards, 24 ins. wide	.. ..	5	0 0
Do. of 100 yards, 30 ins. wide	.. ..	6	5 0
Do. of 100 yards, 36 ins. wide	.. ..	7	10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2¼ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland

EDWARD PHILPOTTS, 17, Cannon-street, Dover, politely requests persons afflicted with RHEUMATISM and RHEUMATIC GOUT, in any form or degree, to communicate with him with a view of obtaining immediate and permanent relief.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

In foolscap 8vo, with Plates and Woodcuts, price 7s. 6d. cloth,

MISS ACTON'S MODERN COOKERY-BOOK. For the use of Private Families. The Ninth Edition, with directions for CARVING, and other Additions and Improvements.

"The whole of Miss Acton's recipes, with a few trifling exceptions, which are scrupulously specified, are confined to such as may be perfectly depended on, from having been proved beneath our own roof, and under our own personal inspection. We add, moreover, that the recipes are all reasonable, and never in any instance extravagant. They do not bid us sacrifice ten pounds of excellent meat, that we may get a couple of quarts of gravy from it; nor do they deal with butter and eggs as if they cost nothing. Miss Acton's book is a good book in every way; there is right-mindedness in every page of it, as well as thorough knowledge and experience of the subjects she handles."—*Medical Gazette.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

NEW EDITIONS OF NESBIT'S MENSURATION, LAND SURVEYING, &c.

Just published, New Edition, with the addition of a Treatise on Levelling, 12mo, price 6s. bound.

EXTRA GRAND HORTICULTURAL EXHIBITION, PRIZES £200.

THE DEVON AND EXETER BOTANICAL AND HORTICULTURAL SOCIETY intend holding an Extra Grand Exhibition on Wednesday and Thursday, the 17th and 18th days of July next, during the meeting of the Royal Agricultural Society, at Exeter. Competition will be open to all Subscribers to the funds of the Society of 1*l.* 1*s.*, not being nurserymen or dealers in plants. Schedules of the Prizes may be obtained on application to the Honorary Secretary, T. WILLIAM GRAY, Esq., 4, North-bridge, Exeter.—Feb. 2

RENDLE'S TRUE WILLCOVE BROCCOLI.—*This superior variety has been proved by thousands to be the best late sort in cultivation, and can be recommended with much confidence. We have saved a small quantity this season on our own grounds, from some of the finest heads ever seen; price* 1*s. per packet, free by post.*

*** Twenty packets to the Trade for 12*s.*, or 50 for 2*l.* 10*s.* It will give the most complete satisfaction.

Our commercial stamp is on each packet.

COLE'S SUPERB RED CELERY, 1*s.* per packet.

Apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

SEED POTATOES.

THOMAS JACKSON AND SON respectfully inform parties having parcels from London that their IMPROVED KIDNEY POTATO may be obtained true from the Wholesale Seed Firms in London named below, at the same price as advertised by T. J. and Son, viz.:

J. Wrench & Sons, London Bridge
Minier, Nash, & Nash, Strand
Gordon, Thompson, & Keene, Fenchurch-street
Noble, Cooper, & Bolton, 152, Fleet-street
Flanagan & Son, Mansion-house-street
Hurst & M'Mullen, Leadenhall-street
F. Warner, Cornhill
G. Charlwood, Tavistock-row, Covent-garden
H. Clarke, 86, High-st., Boro'
J. Kernan, Russell-street, Covent-garden.
J. G. Waite, 181, High Holborn.

And of most of the Wholesale Seedsmen in the country, at a slight advance of price, and from the advertisers, at 10*s.* per bushel, delivered free in London, or at any station on the South Western Railway.—Nursery, Kingston, Surrey, Feb. 2.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2 feet, is 3 weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5*s.* per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetar's, and 20 to 24 per stem. 2*s.* per quart.

BURBIGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s.* per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be furnished on application, and every article connected with the trade supplied on terms to defy competition. Garden Tools, Nets, Mats, Mushroom Spawn, and Potatoes saved from selected stocks at moderate prices.

PLANTING SEASON.

ALFRED BALSTON begs to inform planters he has still a large proportion of his Nursery Stock to dispose of, which, in consequence of having relinquished the trade, he offers at very reduced prices. The Stock comprises every variety of ORNAMENTAL, FRUIT, and FOREST TREES, and all the best kind of SHRUBS in cultivation, no expence having been spared in the collection, and from the light nature of the soil in which it has grown, the plants have all a mass of fibrous root, which causes them to grow most luxuriantly after being transplanted.

A.B. particularly recommends the following: Common Laurel, 9 inches to 1 foot, 15*s.*; 1 to 2 feet, 30*s.*; 2 to 4 feet, 40*s.*; 4 to 6 feet, 80*s.* per 1000. Portugal Laurels, 1 to 2 feet, 10*s.* per 100. Rhododendron ponticum, 1 to 2 feet, 30*s.*; 3 to 4 feet, 60*s.*; 4 to 5 feet, 100*s.* per 100. Ghent Azaleas of all the finest kinds, specimen plants, 2*s.* 6*d.* each; smaller ditto, 6*s.* per dozen. Rhododendron campanulatum, caucasicum, catawbiensis, &c., 100*s.* per 100. Standard Roses of all the finest sorts, 12*s.* per dozen. A large stock of Evergreen Oak in pots and transplanted; also common Oak, Elm, Beech, Birch, Berberis, Hornbeam, Privet, &c.

Orders must be accompanied by remittances. Orders amounting to 5*l.* delivered free.—Poole Nursery, Dorset.

JOSEPH BAUMANNS, NURSERYMAN, Ghent, Belgium, begs to offer the following plants.

12	Cypripedium guttatum	£4	0*s.*	0*d*
25	Do. do.	7	0	0

A most beautiful hardy Orchid.

The usual discount to the trade on any plants ordered by the 100 (see J. B.'s Catalogue). All letters must be post paid.

N.B.—Postage stamps do not prepay any letters to Belgium.

VERBENA, "COUNTESS OF YARBOROUGH."—This will be found to be the most rapid-growing Verbena yet known, and a most profuse bloomer, attractive colour, and splendid habit; one plant covered a bed 6 feet square, the colour a bright lavender, with a light eye, the flower-spike 63 pips deep and fine shape, and the freest seeder yet grown; one plant and one packet of seed saved from the above (Defiance grown by its side), sent free by post for 5*s.*; very strong single plants, 3*s.* 6*d.* each—discount to the trade if six are ordered. A remittance from unknown correspondents.

JAMES ROBINSON, Florist, River Head, Louth, Lincolnshire.

POTATOES FOR SEED.

TRUE ASH-LEAVED KIDNEY, good sample for general purposes, the best Early Potato grown, 5*s.* per bushel of 56 lbs., or 1*s.* 6*d.* per peck. Flour Ball, second early, the same price.—N.B. A good collection of Dahlias, Fuchsias, Geraniums, Verbenas, Roses, Tulips, Vegetable and Flower Seeds, &c., at moderate prices.—Apply to R. RILOTT, Seedsman, &c., Donnington, near Spalding, Lincolnshire.

SAMUEL FINNEY AND CO.'S NEW CATALOGUE OF SEEDS is now ready, and will be forwarded gratis on the receipt of two penny stamps for postage. In forming our Collections of Seeds we have taken special care to include all the select and most approved kinds, and such as we can confidently recommend.

Of VEGETABLE SEEDS, our Collections contain a full supply of all that is requisite for the largest establishment, and the kinds and quantities for each collection are stated. No. 1, 2*l.* 10*s.*; No. 2, 1*l.* 10*s.*; No. 3, 1*l.*; and No. 4, 12*s* 6*d.*

Of FLOWER SEEDS, we have included all the most choice and showy kinds, particularly those we know to succeed well in the north, and a full list of all the best kinds of German Seeds, imported direct in sealed packets, with prices.

A Collection of 100 packets of the best hardy and half-hardy kinds for				15*s.* 0*d.*
Ditto	of 50	ditto	ditto	8 0
Ditto	of 25	ditto	ditto	5 0

We particularly recommend this Catalogue to residents in the north, as they will be enabled to purchase to advantage. All orders delivered free of carriage at any of the railway stations between Newcastle and York, Berwick and Carlisle, and by steam-boat to London, Hull, Whitby, Leith, Dundee, and Aberdeen. Railway and water communication to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead, near Newcastle-on-Tyne.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes	8*s.*	Early Manleys	7*s.*
*Early Round Frame	8*s.*	Early Cockneys	7*s.*
Early Ash-leaved Kidney	8*s.*	Fox's Seedling	7*s.*

Second Early Potatoes for Winter and Spring use:

American Native Potatoes	5*s.*	Kentish Pink Kidney	4*s.*
York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

MYATT'S LINNÆUS RHUBARB.

J. MYATT AND SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1*s.* 6*d.*; ditto, Mitchell's Royal Albert, 1*s.* 6*d.*; Victoria, 9*d.* The usual Trade allowance.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford.—Feb. 2.

UNIVERSAL CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, CHRYSANTHEMUMS, PETUNIAS, &c.

G. SMITH'S Priced and Descriptive Catalogue contains the very best selections of the above; with a useful note and a marked List of the best Verbenas for exhibition in pots, with mode of training, and what is of great importance to exhibitors, the time of stopping back, so as to catch a sheet of bloom when it may be required; with descriptions of his superb Seedling Fuchsias, Verbenas, Petunias, &c.; and will be forwarded on the receipt of one postage stamp.—Tollington Nursery, Hornsey, Islington.

WM. HAMILTON, SEEDSMAN, &c., 156, CHEAPSIDE, LONDON, will forward free by post, on receipt of 5*s.* 6*d.*, 25 varieties of the most beautiful Hardy ANNUALS, with the SCIENTIFIC AND ENGLISH NAME, TIME OF SOWING AND FLOWERING, MODE OF CULTURE, &c., printed on each packet; 12 varieties, free by post, 3*s.*

VEGETABLE and other SEEDS of every description, including all the new Peas and other Seeds of the season.

W. H.'s DESCRIPTIVE CATALOGUE will be forwarded on receipt of two postage stamps.—156, Cheapside, London.

OAKS AND SPRUCE on Sale, delivered either in Liverpool or Glasgow. Fine healthy strong grown OAK,

5,000	Plants, fully 5 to 6 feet high, at 16*s.* 6*d.* per 1000.			
10,000	do.	3 feet	12 0	,,
2,000	SPRUCE,	5 feet	16 6	,,
2,000	do.	3 feet	12 0	,,

These Trees have been transplanted, and will be found good and reasonable.—For further particulars, apply to J. W., Box B, 35 Post-office, Liverpool.

THE "GREAT BRITAIN" CUCUMBER.—Cucumber growers and others who are desirous of growing a long and handsome variety of black spine Cucumber, and a prolific bearer, fit for any season of the year, may obtain it of W. HARRIS, Strawberry Cottage, Brook-street, Upper Clapton, in packets of 6 seeds, for 2*s*, in postage stamps.

Extract from the Gardeners and Farmers' Journal, of May 5th, 1849.—"I send you the particulars respecting the Cucumbers I forwarded for your inspection. Mr. Hunter, gardener to N. Clepton, Esq., Islington, purchased some of the seeds of my Great Britain Cucumber, and he now complains that his fruit is not so long as those he saw at my place last August. He cut the first fruit on the 14th of April, and he has cut 12 since, none of which are shorter than the one you saw. He has, besides 12 fruit on two plants at the present time, from 18 to 21 inches in length. These I saw myself, and none of them are fit to be cut; they will of course grow to a much greater length. W. HARRIS"

[We may, in reference to this matter, observe that Mr. HARRIS forwarded us for inspection one of his Great Britain Cucumbers, which measured exactly 24 inches in length; it is a handsome, well grown fruit, and fit for table. We think this is not bad Cucumber growing in such a season as we have had for the last five or six weeks.]

GENUINE HOME-GROWN SEEDS FOR THE KITCHEN GARDEN, may be had of the Subscriber, in collections of 12*s.* 6*d.*, 1*l.*, 2*l.*, and 3*l.* worth, containing the most approved varieties in cultivation. Also for the Flower Garden, in selections of 25 kinds for 6*s.*, 50 for 10*s.*, 100 for 18*s.* packed in Ayres and Moore's new labels, with directions for culture, time of flowering, whence introduced, &c.—WILLIAM MASTERS, F.H.S., Exotic Nursery, Canterbury.

W. M.'s New Catalogue may be procured on pre-paid application. Orders amounting to 2*l.* and upwards delivered to any station on the South-Eastern Railway.

NEW VERBENA, "WONDERFUL."

GEORGE MOORE, Perry Barr Nursery, near Birmingham, has the satisfaction to offer the above beautiful VERBENA, raised by Mr. C. J. Perry, of Handsworth, and it is without doubt the finest show variety ever raised. The truss is very large, in some instances measuring upwards of 3 inches in height, and 2¼ inches in diameter; and invariably filling up well in the crown. The lower pips are the size of a shilling, and of good form, each touching the other, so as to form a complete and unbroken surface. Habit like Defiance, but blooming more freely; colour pure white, with primrose eye. G. M. would call attention to the following notices of the press:

"Among the Verbenas, a white seedling, raised by Mr. Perry, the honorary secretary to the society, is entitled to special notice. The pips are of a very large size, and well formed, being a pure white colour, with a yellow eye. It bids fair to supersede everything of its class, and obtained the highest distinction which the judges had to bestow—that of a certificate of merit."—*Midland Counties Herald, June* 28, 1849.

"The Verbenas were of the highest order of merit, and have never, we imagine, been surpassed either for variety, size of truss, or beauty of form. The principal exhibitors for Mr. Smith's prizes were Mr. Perry, Mr. H. Williams, and Mr. R. Hallam, with whom there was so close a competition as must have caused the judges some trouble. The varieties most striking were War Eagle, St. Margaret, Valentine de Sauveuse, Gem, La Reine, Mr. Perry's new white seedling, already noticed by us as a production of such distinguished merit as to surpass everything of its kind, a distinction to which all competent judges who have seen it consider it entitled. It received from the judges a certificate of merit."—*Midland Counties Herald, August* 2. 1849.

"VERBENAS; *P. Handsworth.*—A good pure white flower, and a very free trusser, one of those submitted to us throwing above 40 pips of good size; form pretty good, and tolerably smooth on the edges; perfectly free from tint or flush of any colour, saving the eye, which is clear and distinct, pale primrose."—*Gardeners' Journal.*

It was also favourably noticed in the *Aris's Birmingham Gazette* and the *Birmingham Journal*, and has received the following prizes:—Handsworth and Lozell's Horticultural Society, June 26, 1849.—Certificate of merit for 3 blooms, and in first stand of 6. July 3. Certificate for 9 blooms, and in first stand of 24, for Mr. G. Smith's prize of 3*l.*; also in first stand of 12. Walsall Horticultural Society.—Extra prize for 6 blooms, and in first stand of 6.

Plants will be ready for delivery on the 1st of May, at 5*s.* each, with the usual trade discount if three are ordered. Sole agents for London, Messrs. HUGH Low and Co., Clapton.

Perry Barr Nursery, Feb. 2.

THE REAL CASSABAR MELON.

THE LARGEST AND FINEST MELON IN THE WORLD.

J. WEEKS AND CO. beg to offer to the Nobility and Gentry the above for Sale, at 5*s.* per packet. Early orders are requested, there being but a limited quantity to dispose of.—J. WEEKS and Co., King's-road, Chelsea.

FERN SEEDS, &c.

GEORGE BENNETT begs to inform the lovers of FERNS, that he has purchased the entire stock of rare and valuable Fern Seed (sent home from New Zealand by the late Curator of the Sheffield Botanic Gardens), which he purposes selling at the reduced price of 2*s.* 6*d.* per packet (advertised in the Gardeners' Journal in August, 1849, at 10*s.* 6*d.* per packet). The names of the varieties are as follows: No. 1, Todea sp., variety Australis or Black Tree-fern; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata, fine silvery-leaved Tree-fern; No. 4, Mixed varieties of Hymenophyllum, Trichomanes, Adiantums, Asplenіums, Lomaria, Niphobolus, Pteris, Cyatheas; No. 5, Mixed varieties of Alsophylla dealbata or Silver Tree-fern.

G. B. has also a quantity of valuable Shells from the above country, as well as a great quantity of Taxus sp., grows on the highest mountains in New Zealand. He has also for sale a valuable collection of rare specimens of Ferns in excellent preservation, of which printed Catalogues, with a list of prices, may be had on application to GEORGE BENNETT, Brandon Lodge, near Coventry, Warwickshire.

A remittance must accompany the order, either in postage stamps or Post-office order, made payable at Coventry Post-office, to G. B., as above.

NEW STRAWBERRY, "STIRLING CASTLE PINE."—The Subscriber begs to intimate that he has purchased the Stock of the above from the raiser, Mr. LAING, of Stirling. Its principal characters are as follows: Size of fruit large, classing with Keens' Seedling, British Queen, &c.; form somewhat irregular, inclining to conical; colour pale red, or scarlet when fully ripe; flavour excellent, partaking of that of the old Red Pine. It is also very prolific. Having been raised in 1846, it has now been thoroughly proved, and the following notices of it, selected from many others, will, it is hoped, be a sufficient guarantee for its superior merits:

"We recommend Mr. Laing to propagate this variety, and advertise it, as, from the specimens submitted to us, we consider it a most valuable addition to this useful family of fruits."—*Mr. Macintosh, in North British Agriculturist of Aug.* 1.

"This Strawberry seems to be an abundant bearer; fruit large, juicy, and highly flavoured. It may rank as a first-class fruit, will succeed the Keens' Seedling, and prove an excellent market variety."—*Mr Macnab, in Report of Caledonian Horticultural Society.*

Plants can now be sent out, 20*s.* per 100, or 3*s.* per doz. Post-office orders or references required from unknown correspondents. Agents in London, Messrs. Hurst and M'Mullen, 6, Leadenhall-street; and in Dublin, Messrs. Drummond, 58, Dawson-street.—ROBERT M. STARK, Edgehill Nursery, Edinburgh.

SEEDS FREE BY POST AND BY RAIL.

JOHN SUTTON AND SONS beg to refer the readers of the *Gardeners' Chronicle* to their Advertisement, which appeared in the second page of last week's Paper (Jan. 26).

Also to their List of NEW EARLY POTATOES, in the first page of the same number.

N.B. Small orders should be accompanied with postage stamps in payment.—Reading Seed Warehouse, Reading, Berks, Feb. 2.

SEEDS, &c.

ABRAHAM HARDY AND SON, SEED GROWERS, Maldon, Essex, feel pleasure in informing their friends and supporters that their Priced Retail List of AGRICULTURAL, VEGETABLE, and FLOWER SEEDS, also selected SEED POTATOES, is now ready, and will be sent to any address, on receipt of one penny postage stamp.

NEW REGISTERED GARDEN-POT.

OLIVER AND Co. beg respectfully to announce to the nobility, their patrons, and the public, that their newly-invented GRADUATED FLOWER POTS, for perfecting the growth of Plants, will be ready for delivery on the 1st March. Specimens on view at 210, Regent-street, opposite Conduit-street, London.

SUTTON'S NEW PRICED CATALOGUE OF HOME GROWN SEEDS, being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL, and FLOWER SEEDS, with prices affixed to each article, will, it is presumed, be found the most useful and convenient of any yet presented to the public.

All purchasers of Seeds would do well to peruse this Catalogue, as the low prices therein quoted will enable them to effect a great saving in their expenditure. It will be sent gratis on the receipt of a penny stamp, for postage.

MESSRS. SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS are now in course of delivery at the undermentioned prices. No. 1, 2*l.* 2*s.*; No. 2, 1*l.* 1*s.*; and No. 3, 12*s.* 6*d.*—Reading Seed Warehouse, Reading, Berks.

NEW ICONOGRAPHIE OF CAMELLIAS, published by ALEXANDER VERSCHAFFELT, Nurseryman, Ghent, Belgium. Every month appears a Number with Four Plates of the finest and newest Camellias, with their description, price 1*l.* 1*s.* a year; or the 12 Numbers, free to England, price 1*l.* 1*s.*

A. VERSCHAFFELT will send out this summer his NEW CAMELLIA JACKSONII, 3*l.*; do. do., very strong, 5*l.* Drawings of it may be had, gratis, on application.

36 new varieties of Ghent AZALEAS (now ready for sale); they are of the finest colours, from the lightest to the darkest, and all are large and good flowers, fine strong plants, at 2*s.* 6*d.* each; the 36 varieties, 4*l.*

A General Catalogue of Plants may be had, gratis, on application, free by post.

ALEXANDER VERSCHAFFELT, Nurseryman, Ghent, Belgium.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.

No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pints Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. £3 3 0
No. 2, two-thirds of the above 2 2 0
No. 3, one-third ditto 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

*** Cole's Superb Dwarf Red Celery, 1*s.* per packet.

WHITETHORN AND BEECH FOR FENCING.—500,000 very fine four years old transplanted WHITETHORN, at 6*s.* per 1000, or, selected, at 7*s.* 6*d.* per 1000; and fine Bedded BEECH, 2 to 3 feet, at 8*s.* per 1000. A large quantity of very fine transplanted OAKS, ranging from 3 to 5 feet, at 35*s.* per 1000. The above are all extremely fine and well rooted. Samples if required.—ARTHUR MACKIE, Nurseries, Norwich.

"BROMHAM HALL" GREEN FLESH MELON,
Is the finest flavoured in the World.

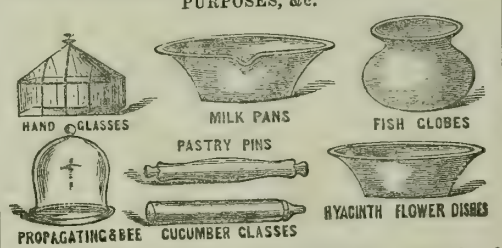
EDWARD TILEY having become possessed of the whole stock of Seed of that very superior Melon called "BROMHAM HALL" GREEN FLESH MELON, respectfully invites the attention of the public generally, to the superiority of this over all other Melons ever yet sent out. It was forwarded to the Editor of the *Gardeners' Chronicle*, July 22d, 1848, for his judgment, and he was of decided opinion that the Bromham Hall Melon was the finest flavoured fruit he had ever tasted. It was exhibited at the Chiswick Exhibition, July 11, 1849, where it was awarded by the judges the Silver Knightian Medal for the best flavoured green flesh Melon. It was again sent to Dr. LINDLEY, August 11th, 1849: "We have received your Bromham Hall Melon, it was much over ripe, nevertheless it was by far the best flavoured Melon we ever tasted." It was again exhibited at the Horticultural Society's Rooms, Regent-street, September 4th, 1849, and was again pronounced by the judges to be the best flavoured Melon they ever tasted, and was awarded the Banksian Medal. The fruit is very handsome—it is round shaped, hollow crown, beautifully netted, thin skin, flesh very firm and solid, melting flavour, very free setter, and abundant bearer. Weight, from 3 lbs. to 4½ lbs. It has been found to do well during the summer, without bottom heat. It may be as easily grown by an amateur in a frame as the common Vegetable Marrow. There is a great advantage in it for the fruiterer, as it will retain its fine flavour for a considerable time after being cut. Sold in packets of 6 seeds, 2*s.* 6*d.*; larger do. of 15 seeds, 5*s.* Also the following fine varieties can be highly recommended all true:

	s.	*d.*	
Queen Melon	1	6	per packet.
Bowood Green Flesh	1	0	"
Beechwood do.	1	0	"
Windsor prize do., 1*s.*; Emperor ..	1	0	"
Fleming's Trentham Hybrid	1	0	"
Duncan Green Flesh do. improved ..	1	0	"
Hampton-court Green Flesh	1	0	"
Egyptian do. do. improved	1	0	"
FIRST PRIZE CUCUMBER, VICTORY OF BATH	2	0	"
Gordon's White Spine	1	6	"

These two Cucumbers are unequalled for their superiority for exhibition, having been thoroughly proved to the satisfaction of hundreds of growers. They will be found to grow as well out of doors on a ridge, or against a wall, during the summer months, as a common ridge Cucumber; also equally as productive. Length, from 20 to 26 inches.

N.B. It is with regret we state that numerous parties have been disappointed by purchasing an inferior variety under the name of Victory of Bath. E. T. begs to say it has proved not to be the true variety sent out by him.

Lord Keynon's Favourite (winter Cucumber), a very scarce variety. It is the best for winter cultivation ever yet grown; it is very hardy, and free setter, and never shanks off; fruit very handsome. Length, about 14 inches. 2*s.* 6*d.* per packet. A packet of each of the three varieties, 5*s.*; if preferred, also a packet of the Bromham Hall Melon will be included with the three Cucumbers for 7*s.*—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or 1*d.* postage stamps.



CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials. packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, OldKent-road, London.

TO PARENTS AND GUARDIANS.

A LADY, residing near Eccleston-square, Pimlico, begs to offer a Comfortable Home to one or two Young Ladies, who may require the care and attention of a mother. Good references given and required.—Address, H. D. D., care of W. Parkins, Stationer, 25, Oxford-street, London.

GLASS FOR CONSERVATORIES AND HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for Scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

TO NURSERYMEN AND SEEDSMEN.

TO BE DISPOSED OF, in consequence of the recent decease of Mr. JOHN RONALDS, of Brentford, the old-established and extensive BUSINESS OF MESSRS. HUGH RONALDS AND SONS, of that place.—For particulars, apply on the premises; or to Mr. E. RONALDS, 109, Upper Thames-street; or to Mr. G. B. TOWNSEND, Accountant, 49, Leadenhall-street, London.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY, and Make the Animal look Better than when Paying 12*s.* and 14*s.* per Week.—Consider the enormous saving in these hard times—times of cheapness.—Apply personally or by letter at MARY WEDLAKE and Co's, 118, Fenchurch-street, London, Oat-bruising and Chaff-machine Manufactory, established upwards of 40 years.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

CORNWELL'S "VICTORIA" RASPBERRIES.

G. CORNWELL is now sending out strong canes of the above, at 25*s.* per 100; or 3*s.* 6*d.* per dozen. To be had at E. CHARLWOOD'S, Covent-garden; NOBLE'S Fleet-street; and of GEORGE CORNWELL, Market-Gardener, Barnet, Herts.

SPLENDID NEW DIANTHUS.

J. REID begs to inform the Public that he has succeeded in saving a small quantity of his new DIANTHUS REIDII. The ground colour is bright scarlet, laced with white, the truss or head of bloom is larger than a Dahlia flower; its dwarf habit is suitable for any situation. By sending 12 Postage stamps to J. REID, Mount Scilla Nursery, near Chippenham, Wilts, in return a packet of seed will be sent.

AMERICAN PLANTS.

GEORGE BAKER begs to inform the gentry and public he has published a NEW CATALOGUE of his AMERICAN AND CONIFEROUS PLANTS, &c., which may be had on application.—Windlesham Nursery, Bagshot, Surrey.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

ORANGE, LEMON, LIME, CITRON, AND SHADDOCK TREES.—The first importation of the above Trees, in most excellent and healthy condition, has arrived from Italy. They are from 2 to 4 feet high in the stems, very straight, and possess strong grafts, and will make splendid trees in two or three years; from 12*s.* to 25*s.* each. They may be seen at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, London. Also Catalonian, Azorian, and Arabian Jessamine Plants. The Double Italian Tuberose Roots are still on sale, 4*s.* per dozen.

BASS AND BROWN'S SEED AND PLANT LIST, stamped to go free by post. Copies forwarded to any address.—The above comprises their General Descriptive priced Spring Catalogue, in which will be found a rich assortment of the newest and best articles that can be procured.

PART 1 contains Lists of new and choice FLOWER AND VEGETABLE SEEDS. The Flower Seeds are in five divisions, Hardy, Half-hardy, and Tender Annuals; and Hardy and Greenhouse Perennials; descriptive of colours, heights, prices, &c.; prefaced by a page of useful Remarks on Sowing and Raising Seeds, with allusions to such as require peculiar care. The Vegetable List contains the time of sowing each description of Seed, giving heights of Peas, and a variety of other useful information.

PART 2. ROOTS, FRUITS, AND BULBS, consisting chiefly of a selection from their Autumn Catalogue of such as are required for spring planting.

Part 3. A descriptive priced List of Geraniums, Fuchsias, Dahlias, Petunias, Verbenas, Chrysanthemums, Cinerarias, Achimenes, Gloxinias, Azalea indica, Stove and Greenhouse Plants, and a variety of Bedding and other Miscellaneous Plants.

PART 4. NEW PLANTS OF 1850, to be sent out in the Spring, consisting of Petunias, Fuchsias, Verbenas, Dahlias, &c.

A separate List of Agricultural Seeds.

Seed and Horticultural Establishment, Sudbury, Suffolk.

The Gardeners' Chronicle.

THE friends of Dr. HOOKER have heard, with much anxiety, that this very distinguished traveller has fallen into the hands of a petty hill-chief, dignified by the title of Rajah of Sikkim, a country now become highly interesting on account of the magnificent vegetation with which Dr. HOOKER has found it to be occupied. We are enabled to state, on good authority, that the seizure of Dr. CAMPBELL and Dr. HOOKER, by this Rajah, was caused entirely by political considerations, and is not due to the scientific researches of the latter within the territories of the hill-chief. In proof of this assertion, Dr. HOOKER has not been treated in his captivity with harshness, but is allowed the use of his books, his papers, his instruments, and his collections. This information is derived from a letter, written by Dr. HOOKER himself, on the 12th of November, and superscribed, "All well, 24th of November," and which he contrived to smuggle away by the fidelity of a servant, with a scanty hope that it would be allowed to reach its place of destination, as it did, by the Marseilles mail, which arrived on the 21st ult. The Southampton mail, on the 26th, brought a part only of a letter of an earlier date (Lachoong Valley, Oct. 25th, 1849), or rather two continuous letters, but ending abruptly, giving an account of a visit to the plains of Thibet; from which the following brief extracts may prove of interest.

"We have spent four days in Thibet! It was, however, a serious undertaking, and required a combination of fortunate accidents, together with all my previous knowledge of the country. It was again by the Lachen Pass that we entered, and we met with a great friend in the Tcheba Jama, a man of intelligence and vigour. Scarcely had we reached the Thibetan frontier, than I set spurs to my pony, and galloped a-head, as far as possible, over the sandy plains, determined to see all I could. The elevation of 17,000 feet made any rapid movement so fatiguing, that my animal soon gave in; and I was obliged to pursue my way on foot up the Lachen, in an easterly direction, and at the back of Kinchinjhow, over sandy, or stony dunes, interspersed with a little Grass, tufts of Nettle, Carex, an Ephedra, and a thirsty-looking Lonicera, only a few inches high.

"Proceeding north-east from Kongra-Lama, I had long stony rolling mountains to the north, and to the east; while to the south, the stupendous snowy mass of Kinchin-jhow rose almost perpendicularly from the sandy plains. As the country was so traversable, I judged it best to follow the Lachen to its source near the Donkiah Pass, which I wished to be, if possible, our return route.

"Late in the day I arrived at the Cholamo Lakes, within sight of the Donkiah Pass, but with my pony so knocked up, that I had the greatest difficulty to drag him after me. Here, however, I refreshed him with some tufts of green Carex, and led him gently back, suffering myself severely from headache, caused by the sun's intense heat; for at this elevation (nearly 18,000 feet) a slight amount of exertion brings on headache. The evening was considerably advanced before I met my friends. When we proceeded, a party of Chinese soldiers followed us, their Ding-pun (or Lieutenant) mounted on a black yak! (Bos grunniens.) He was surrounded with pots and pans, bags, bamboo-bottles, containing butter-milk; his tent, blankets, and other possessions, were all heaped on the same yak, and he, perched a-top of all, looked like a gipsey on a laden donkey. The rider was a small, withered man, arrayed in a green coat; his Tartar cap surmounted with a brass button. Behind came the sepas (or soldiers), enormous, ruffianly-looking fellows, dressed in blanketing. Each was armed with a pipe, a large knife, and a rude, long matchlock lashed across his stern! The matchlocks of the Chinese are always carried slung at right angles across the hip; they are very rude weapons, and have a pronged support, or rest, which falls up with a hinge, and projects like an antelope's horn beyond the muzzle. These ungainly weapons, worn behind and at the lower part of the back, gave the sepas a most comical look. They came in marching order, took no notice of us, and camped close by. We pitched our tents within a low cattle inclosure, on the open plain, burning yak's dung for fuel. The cold was intense, and the wind violent and dusty; the sky brilliantly blue. We resolved to remain here for a day or two."

Immediately after this passage the narrative breaks off abruptly; it is only from another, yet we believe authentic source, that we learn that it was on their return into Sikkim after another attempt, but an unsuccessful one, to enter Thibet at a more eastern pass, the Rajah thought proper to send a band of soldiers, who entered the tents while our travellers were totally unprepared: they were suddenly, and at the same instant seized, each by a separate party; their arms bound behind them with cords (in Dr. CAMPBELL'S case, it is said, accompanied by cruelty), and they were conveyed to the residence of the Sikkim Rajah, at Tumlong, confined as prisoners, and not allowed any communication with each other. The Rajah himself sent a letter, conveying the intelligence to the GOVERNOR-GENERAL, who, in the kindest manner, has written to Sir WILLIAM HOOKER, with the assurance that he has replied to the Rajah's letter, demanding the instant release of the prisoners as a preliminary step to any treaty with him; and his Excellency confidently expects that the next mail will convey the welcome news of the gentlemen being set at liberty.

So far as PEAS are concerned, we have already fulfilled our promise of overhauling the preposterous lists with which buyers are mystified, by the publication of a second rapid sketch of the most distinct of the varieties. The result of this examination is to limit the number of such kinds to 27, exclusive of Sugar Peas, which are not worth having. Admitting that class, we still find only 40. And now let the reader just calculate the number of *aliases* under which this farrago is known in seedsmen's lists. It will be seen that the Early Frame exists under 24 disguises, the Early Charlton has 21, and that, in order to find the 27 which may, by a stretch of complaisance, be admitted, the unfortunate gardener has to push his way through no fewer than 235 claimants upon his attention. Talk of Botany and its difficulties! why they are nothing to this; for in Botany different names indicate real differences, and the *aliases* are trifling in number; but among Peas different names indicate identity or undistinguishable similarity. A gardener in a crowd of Peas is worse off than the traveller who for the first time steps on shore at a French watering-place, and suddenly finds himself hunted by a pack of *Commissionaires*.

And after all, 27 Peas form too large a number to draw from. For ourselves we should be perfectly satisfied with the following half-dozen, viz.:

No. 2. Prince Albert.
4. Auvergne.
9. Bishop's New Long-pod.
18. Bedman's Imperial.
23. Knight's Tall Marrow.
25. Fairbeard's Champion of England.

For we are convinced that they answer every purpose of a family.

Having thus begun the task of turning a river through this Augean stable, we shall go on with it, and next week produce the result of an examination of the Beans in seed lists.

LETTERS received from Mr. FORTUNE by the last mail announce the unexpected discovery by him of a real YELLOW CAMELLIA! It proves to be one of the Anemone-flowered race, the exterior petals being french white, and the central ones of a *rich primrose yellow*. He found it in blossom in a nursery garden in one of the towns in the north of China, which he had visited in his search after Tea plants.

CONTINUING our observations on Cotton culture in India, we have at last come to Madras, where the first experiments were made. This Presidency is somewhat of the shape of a triangle, with its base resting on Central India, and its apex terminating at Cape Comorin. It extends from 8° to 22° of N. lat., and lies between 75° and 85° of E. long. Two ranges of mountains run along its eastern and western coasts, and support between them a table land, which diminishes in elevation from south to north and from west to east, Mysore having a medium elevation of 3000 feet, and the Ceded districts a mean height of 1600 feet above the sea. The eastern ghauts rise at a distance of from 30 to 60 miles from the coast, washed by the Bay of Bengal, with the intermediate country forming an irregularly level, generally sandy plain. The western ghauts rise much more abruptly, and have a much narrower space between them and the Indian Ocean. They join the eastern ghauts at Cape Comorin, and run an uninterrupted course, except at the valley of Coimbatore, which is about 16 miles in breadth, and has the celebrated Neilgherries for its northern wall.

The whole of the above territory, being situated within the tropics, is necessarily under the influence of great heat, especially whenever this is unrelieved by moisture. But the vicinity of a great portion of it to the sea, the elevation of the remainder, and the influence of a double monsoon, much modify the climate. The north-east monsoon, which blows chiefly on the eastern coast, commences usually in October and continues till December, when the rains cease, and the wind becomes dry and parching. The south-west monsoon, which begins in May, continues till August or September, and is felt chiefly on the Malabar coast and western parts of the country. At other times the winds are variable, but mostly southerly from March till May; that is, from the termination of one monsoon till the commencement of the other. (Madras Medical Reports.)

The Mean Temperature of Madras was for 1848.

January	75.5	July	85 3

The Fall of Rain on an Average of 22 *Years.*

January	1.33	July	3.20
February	0.23	August	5.24
March	0.36	September	4.76
April	0.63	October	10.09
May	1.03	November	12.43
June	2.03	December	3.25

As the culture of Cotton, like that of every other plant, is dependant in a great measure on climate, it was necessary to premise with these observations, which may, however, be useful to horticulturists cultivating Peninsular plants.

So long ago as 1790 Dr. ANDERSON (to whom the genus Andersonia is dedicated) was employed in sending Mauritius as well as brown Malta Cotton seeds to different parts of the Peninsula. Dr. ROXBURGH had even then ascertained that the dry and less fertile soil of Coromandel was better suited than that of Bengal to the Bourbon Cotton. In 1813 Mr. METCALFE was sent with American Cotton cleaning machines to Tinnivelly, or wherever his services might be required. It was in this district that success was first attained in cultivating Bourbon Cotton, by Mr. HUGHES, who also produced the best, or Tinnivelly Senna, a result not in either case accidental, but the natural consequence of skilful culture and careful picking. In 1819 the Madras Government determined on establishing four Cotton farms of 400 acres each, under the Commercial Residents

of the districts of Tinnivelly, Coimbatore, Masulipatam, and Vizagapatam. Mr. Heath, who at that time held the above office in Salem and Coimbatore, also succeeded in cultivating Cotton by following the directions which he received from Mr. Hughes. He found that the Cotton came to perfection at a distance of 150 miles from the sea, and obtained in the season of 1823-24, from the district of Coimbatore, 500 bales of clean Bourbon Cotton. We have seen no accounts of the other farms, but it can hardly be accidental that Vizagapatam is stated to be the district in which the largest quantity of Cotton is obtained per acre, and that liberal pruning is practised there. The efforts in other places have not been altogether without results. For Capt. Hughes says, in 1842, "Difficulties and disappointments attended the introduction of the Bourbon Cotton into this (the Coimbatore) district, but which is now to be seen growing in all directions." So Dr. Wight, in the same year, speaks of improving "our indigenous and the now naturalised Bourbon Cotton;" also of "the Bourbon Cotton of the Coimbatore and Salem districts realising in England 9½*d.* per lb., when the country Cotton of the Tinnivelly district sold for only 6*d.* or 7*d.*" The above are at the rate of about 140 and 180 rupees for 500 lbs., for which the exporter pays only about 70 and 90 rupees. "But," Mr. Sullivan observes, "these are the prices paid to the brokers; the prices paid to the growers do not exceed 40 or 50 rupees." And he agrees with Dr. Wight, that all that is wanted is "more competition among buyers, and somewhat higher prices to growers;" and Mr. Fischer, himself an agent for the purchase of Cotton for the Madras merchants, says that the natives only want remunerating prices to grow the Bourbon Cotton. But, in justice to the exporters, we must observe, that the prices of Indian Cotton being dependant upon those of American Cotton, the uncertainties are too great for them to be very liberal.

We have referred to these statements as having been made previous to the present experiments. In the year 1840 three American planters were sent to Madras, and detached to Tinnivelly in January 1841. But it was stated that the sowing season had passed; for, according to the natives, the picking should be over before the land wind sets in, that is, before the 10th of April. The planters conceived that a more northern climate was more suitable, for "the finest Cotton is produced in a temperate climate." They were, after the loss of much time, removed to Errode in the end of August, where a piece of ground within the walls, and another on the glacis of the old fort, were selected, both in being a "black Cotton soil," with other plantations two miles distant having a deep reddish loamy soil. In these American, Bourbon, and country Cotton seed were sown. One of the planters objected to the "dry soil of Errode," observing that "at Coimbatore there has been an abundance of rain, and the land, from that and other causes, is in a good condition for ploughing." This district had been recommended by Mr. Heath, and by Mr. Fischer, and subsequently approved of by Dr. Wight; two of the planters were therefore here established. American and native Cotton were sown in drills, and some broadcast, about the middle of September, both in the black Cotton ground and in the ordinary red soil of the Peninsula, that in which the Bourbon Cotton is found to thrive best.

As the experimental culture in Coimbatore is interesting on account of the several physical questions which have been discussed during its continuance, we think it desirable to be more minute in their relation, as well as in detailing the progress of opinions. Thus so early as in December, when the leaves had shrivelled and become of a copper brown colour, Mr. Morris reported, from Errode, "I am fully convinced we never will succeed in raising the New Orleans Cotton in India;" so Mr. Simpson stated at Coimbatore in February; "In my opinion the New Orleans Cotton plant will not succeed in this part of India." The former gave as his reasons; —"First place, during the rainy season, which is the proper time for planting, we have had entirely too much rain, and so soon as the monsoons are over, unfortunately we have no rain at all;" and Mr. Simpson, that "excessive hot dry weather has been the main cause of failure;" and also the "insects, which seem to declare vengeance against the young bolls." Dr. Wight, who visited these farms in September and in January, ascribed the failure to two causes. First, to the soil "having become so hard as to be alike impermeable to both moisture and the roots of the plants," while "the frequent ploughing and hoeing, opening the soil, and giving free exit to the little moisture it had," with "the tearing of the superficial roots, still farther tended to impoverish the plants' channels of supply." To this Mr. Simpson replied: "By ploughing deep, the soil is pulverised below the influence of the sun, and mellows the land, which allows the tap root (12 inches or more in length) to penetrate into a moist earth, which will give support to the plants throughout a dry hot season." There is truth in both observations, and their value depends upon their proper application. Secondly, insects perforated the stems in all directions, but especially near the surface of the ground; but "neither the Bourbon nor country Cotton suffered from these attacks, protected, perhaps, by their slower growth, and harder and more woody texture." But in the *red soil*, near Errode, "the plants, in place of being very stunted in their growth, and nearly one-third dead or dying, appeared well grown, and bearing a fair crop of large bolls."

In Coimbatore the experiment was at that time less successful, the plants in the black soils having grown hardly a pound of Cotton, and being generally unhealthy, while those in the red soil, though small, were generally very healthy; but the failure of the crop was mainly owing to "an insect which seems hitherto to have attacked every flower, depositing its eggs in the germen." But neither Capt. Hughes nor Dr. Wight even then despaired of success; the latter suggested some good modifications of culture, to suit it to the Indian climate.

A few short weeks, however, completely changed the prospects of the experiment; up to the middle of January it was expected that not a single pound of Cotton would have been gathered. "About this time a heavy fall of rain took place, which had the effect of refreshing and greatly reviving the plants; a second fall was experienced about the beginning of February, and seemed completely to renovate them." In the middle of that month they became quite healthy, full of blossom and fruit, and gave promise of a large crop of Cotton. About the 6th and 8th of February 6 lbs. of Cotton were picked at Coimbatore, after that the picking continued uninterruptedly, and almost daily increased in quantity until the 13th of April, when it rose to 3500 lbs." From the irregularity of the stand of plants, the quantity per acre could not be correctly ascertained, and though in some parts at the rate of 500 or 600 lbs., the actual produce was 183 lbs., but allowing for wastage, from bad seed, &c., 233 lbs. 14 oz., per acre. The black soil produced a larger proportion than the red soil. These facts prove that the culture depended almost entirely upon the season, and that opinions respecting its success varied according to the falls of rain. Dr. Wight having succeeded Capt. Hughes in the middle of February 1842, we shall conclude this subject with the results of his experience in the following years, and up to the present time.

ON PEAS.

(*Continued from p.* 53.)

II. Peas, blue, green, or light olive.

§ 3. Tall sorts.

12. *Bellamy's Early Green Marrow*, 4½ to 5 feet high; pods long, straight, cylindrical, containing 6—7 Peas, some of which when ripe and dry are white, but the generality are olive green; a good bearer, tolerably early, and, on the whole, an excellent Pea. *Sutton's Superb Green Marrow* ranks near this, but the Peas are not so sugary.

13. *Fairbeard's Surprise*, or Fairbeard's Early Surprise, 5 feet high; pods thick, roundish, slightly curved, containing 7—9 large Peas of good quality; an excellent bearer, and early.

14. *Adamson's Matchless Marrow*, 5 feet high; pods large, flat, curved, containing 6—7 Peas; an excellent bearer, as early as the Charlton. Related to this is the *Tall Imperial*, alias Tall Blue Imperial, Tall Green Imperial, New Tall Imperial, Tall Prussian or Blue Union, Blue Union, Spanish Patriots, Green Nonpareil, Carré vert, Carré vert gros, Carré vert gros Normand. About 7 feet high; pods broad, obtuse, containing only 6 Peas, therefore must be now considered second-rate.

15. *Tall Green Marrow*, New Large Green, or Imperial Green, 7 feet high; pods large, broad, and rather flat, containing 8 or 9 Peas of excellent quality, yellowish green when ripe; a good prolific late sort. The *Gros Vert Normand* is allied to this, but scarcely so good.

16. *Victoria Marrow*, 6 to 7 feet high; pods nearly 4 inches in length, generally in pairs, straight, roundish, containing 7 or 8 very large Peas of good quality; an abundant bearer, remarkable for the great length of its pods, in which respect it exceeds all other sorts in this class.

II. Peas, blue, green, or light olive.

§ 4. Dwarf sorts.

17. *Groom's Superb Dwarf Blue*, about 18 inches high; pods large, broad, rather flat, containing 8 or 9 Peas of excellent quality, and very productive; a good summer dwarf Pea.

18. *Bedman's Imperial*, 2½ to 3 feet high; pods somewhat curved, roundish, containing generally 6 or 7 large blue Peas; an excellent bearer, though not very early, but as a summer Pea highly deserving of cultivation. The *New Imperial* is much inferior to it.

19. *Blue Prussian*, also called Dwarf Blue Prussian, Royal Prussian Blue, Prussian Prolific, Green Prussian, Fine Long-podded Dwarf, Early Dutch Green; 3½ feet high; pods long, roundish, containing 7 or 8 Peas; a good bearer, and though an old variety, it must still be ranked amongst the best of dwarf Peas for summer use.

20. *Dwarf Imperial.* — Imperial, Blue Imperial, Dwarf Green Imperial, New Improved Imperial, New Improved Dwarf Imperial, New Dwarf Imperial, New Long-podded Imperial, Green Nonpareil, Sumatra, Dwarf Blue Prolific, Blue Scymetar, Sabre, Blue Sabre, New Sabre, Dwarf Sabre, Nain vert impérial, Nain vert gros; 4 feet high; pods large, long, rather flat, much pointed, containing 8—10 Peas; good for late summer use. *The Dwarf Green Marrow*, alias New Green, Early Dwarf Green, Early Green, New Early Green, Royal Dwarf Marrow, Extra Green Marrow, Holloway Marrowfat, Green Rouncival, Wellington, New Green Nonpareil, Prince's Superfine Summer, Vert Hâtif à la Moelle, is considered a good sort, but it is much inferior to Knight's Dwarf Marrow.

21. *Flack's New Large Victoria*, 2½ to 3 feet high; pods middle-sized, flattish, nearly straight, well filled; Peas generally 6 in a pod, large, compressed, blue when dry, and some partly white; a few days earlier than the Blue Prussian, and is a very good prolific dwarf variety.

22. *Woodford's Green Marrow*, about 3 feet high; pods large, flattened, containing about 6 large Peas, which keep long green; a good bearer, ripening a fortnight later than the preceding.

III. Peas wrinkled, or indented when dry.

§ 5. Tall sorts.

23. *Knight's Tall Marrow*, or Knight's Late, Ridé, ou de Knight, Ridé tardif.—*Knight's Tall White Marrow*, *Knight's Tall Green Marrow*, *Knight's Tall Blue Marrow* may be considered as varieties differing in the colour of the dry seeds, but in no other essential particular; 6—7 feet high; pods large and broad, containing 7—9 Peas, more sugary than any other yet known; very productive, and bears long in succession; well adapted for a principal, or late summer crop. A sort called the *Waterloo* resembles the above, but is inferior.

24. *British Queen*, about 5 feet high; pods large, straight, nearly round, containing generally 7 very large Peas, in fact enormous, some measured when green 1½ inch in circumference; they are thicker in the skin, and scarcely so sugary as Knight's; but the sort is valuable for those who prefer large Peas.

25. *Fairbeard's Champion of England*, about 5 feet high; pods long, somewhat curved, and slightly flattened, containing 7 or 8 large Peas of very sugary quality, of a bluish colour when dry; an abundant bearer, highly deserving of cultivation.

III. Peas, wrinkled, or indented when dry.

§ 6. Dwarf sorts.

26. *Knight's Dwarf Marrow*, or Knight's New Dwarf, Ridé nain, of which there are some varieties differing in the colour of their seeds; about 3½ feet high, pods broad, rather flat, containing about 6 Peas, similar to Knight's Tall Marrow in point of sugary quality; an abundant bearer, a week earlier than Knight's Tall Marrow. *The New Indented Green Marrow* is not so sweet.

27. *Maclean's Seedling*, about 2 feet high, pods large, nearly straight, a little flattened, Peas very large, compressed, owing to their closeness in the pod, of excellent quality, blue when dry; a valuable, early, prolific dwarf variety.

Class B. Peas without a tough lining to the pod; Peas and pods both eaten.

Sugar Peas; Pois sans parchemin ou Mange-tout. The pods of all the Peas in this class should be gathered when quite young, like French Beans, and cooked after the same manner. They are little grown in England, and not worth growing; for which reason they are not numbered, although enumerated.

§ 7. Tall sorts.

Large Crooked Sugar, alias Sugar Pea Broadsword, Six-inch-pod Sugar Pea, Sans parchemin blanc a grandes cosses, Cornes de bélier. About 6 feet high, pods very large, broad, fleshy, crooked, late, productive; one of the best of this class.

Géant sans parchemin is also remarkable for the size of its pods, which are even larger than those of the preceding.

Vilmorin's Sugar, about 6 feet high; pods small, round, and straight; a good bearer.

Late Wyker Sugar, or Late White Sugar, 6—7 feet high; pods roundish, small, much curved; a good bearer, and very late.

Sans parchemin à fleurs rouges, grows tall and is also very late.

Turc ou couronné sans parchemin, of which there are two varieties, one with red and another with white flowers; pods numerous, tender, and sweet.

Sans parchemin à demi-rames has straighter and fuller pods than the Large Crooked Sugar, and is earlier than it.

White-podded Sugar, or Sans parchemin à cosse blanche, 5—6 feet high; curious on account of the white colour of the pods, which they retain from their first development to their maturity; the flowers are red; more curious than useful.

Yellow-podded Sugar, or Sans parchemin à cosse jaune, is analogous to the preceding. The *Alberjas* has been included amongst the Sugar Peas, but as it has sometimes a very thin lining to the pods, it cannot be recommended.

§ 8. Dwarf sorts.

Early May Sugar, alias Early Dutch, Early Sugar, Dwarf Dutch Sugar, Nain à la moelle d'Espagne; 4 feet

high, pods small, round, straight; very early, but tender.

Dwarf Dutch, or Dwarf Crooked Sugar, Dwarf Sugar de Grace, Early Dwarf de Grace, Nain hâtif de Hollande, Nain de Hollande. About 3 feet high; pods short, small, crooked; a week later than the preceding, but only a moderate bearer. The Dutch cultivate it under glass.

Dwarf Sugar, or Ledman's Dwarf, Gros Nain Sucré, Nain Sucré. About 3 feet high; pods long, nearly round, and slightly curved; a moderate bearer; late.

Sans parchemin nain ordinaire, 2 to 3 feet high; pods small, abundant, very tender.

En Eventail, the dwarfest of all the Sugar Peas, being only about a foot high, branching from the ground, somewhat fan-shaped; late and moderately productive.

Tamarind, or Late Dwarf Sugar, about 4 feet high; pods large, broad, and much curved, from 4 to 6 inches long. An abundant bearer; the latest in this class.

All the sorts of Peas to which numbers are prefixed are considered of first-rate excellence; and, from the brief descriptions given, any one can select what will suit him, as regards either early or late sorts; dwarf or tall; white, green, or blue; small Peas, as the Early Frame, Prince Albert, and Auvergne; very large Peas, as the British Queen; or very sugary Peas, as Knight's Dwarf and Tall Marrow. The sorts enumerated afford ample choice; and where all are good there can be no difficulty in selecting.

In addition to those here enumerated are sundry others with new names, concerning which we have no sufficient information. *R. T.*

A FEW EXAMPLES OF THE WORST EFFECTS OF MUTILATING THE BRANCHES OF TIMBER TREES.

There are two divisions into which the results of pruning timber trees may be divided: one which is evident to our ocular senses; the other, and not the least important, that which is derived from scientific data, and which must, in a great measure, be taken upon trust. To the latter division of the subject I have alluded in another place: it is with the visible effects, strictly speaking, that I have to deal on the present occasion. The accompanying drawings are no exaggerations, they are sketches from nature, and I trust will convey a correct idea of the subject they are intended to illustrate.

In fig. 1, which is drawn from a piece of Elm, split longitudinally for the purpose, some of the worst effects of a barbarous mutilation are evident. At A, the wound is closed over, but the rains, and the action of the weather for a long series of years, have left their effects in the decayed portion of the old branch; the injurious character of which, supposing the tree to have been used as timber, needs no comment. At B, a woodpecker has commenced a dormitory; the rain has effected a lodgement, penetrated the tissues of the wood, and ramified through the medullary rays, the walls of which it has destroyed, and seriously damaged the longitudinal system of the trunk. The example at C, shows a mode of pruning often highly extolled, viz., that of leaving a considerable portion of the branch attached to the trunk, but in this instance the wood was much decayed to the very centre of the tree. Of course when the branch was removed, vitality in a given portion of the tree was destroyed. The effects of such in a series of years is self-evident.

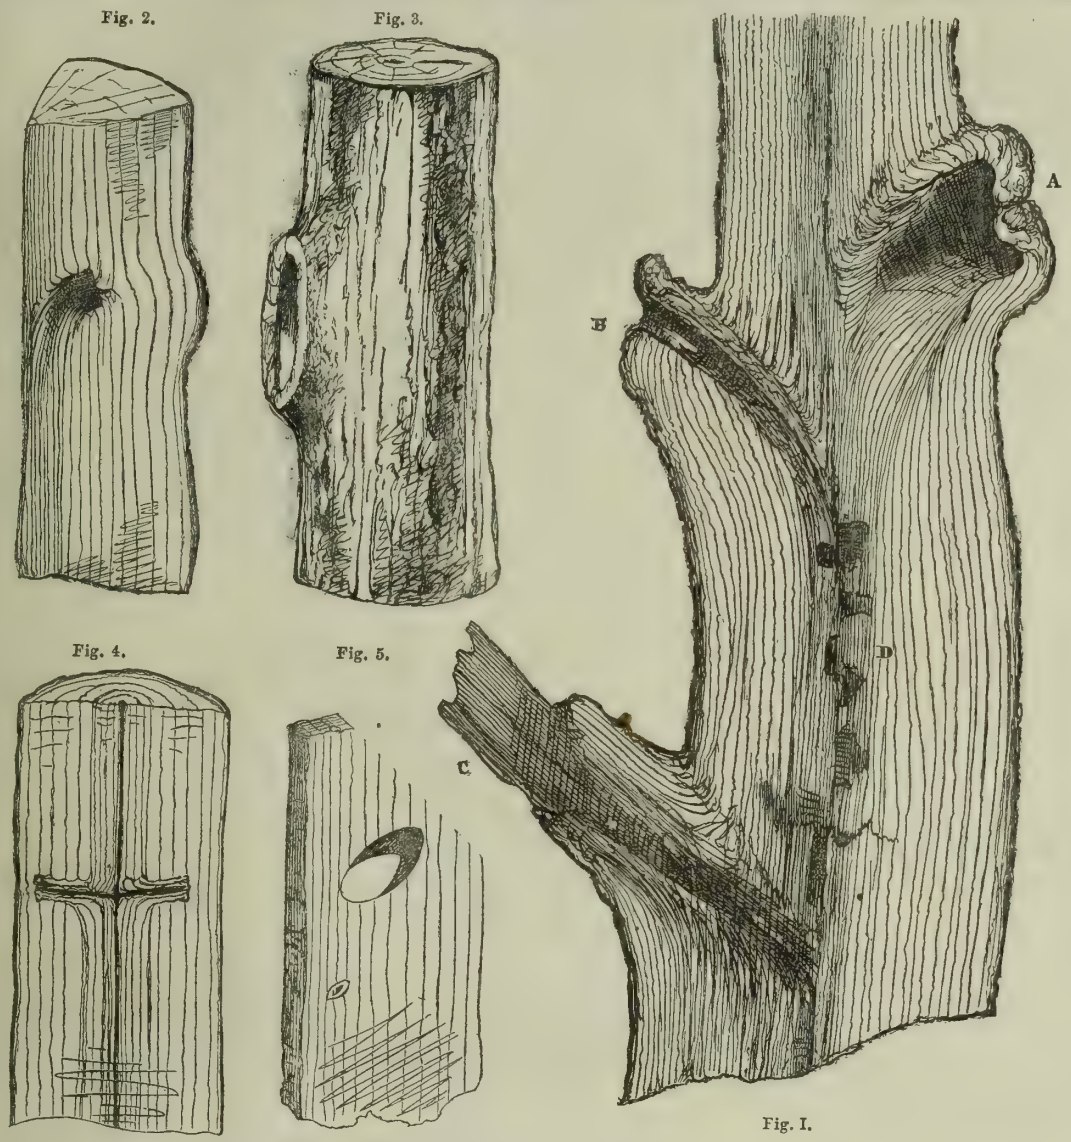

Fig. I.

A case of common occurrence, though often overlooked, is indicated in figure 2. When the tree was of a few years' growth, its lower branches were destroyed, to give it a "straight trunk." Successive annual layers of wood imbedded the dead stump, and the only external indication was a protuberance on the trunk. The mechanical effects of this apparently trifling case were seriously to damage several pieces of plank when the tree was sawn up for building purposes. Figure 3 merely shows the process of a wound "growing over." It must be borne in mind that a wound never heals. In figure 4 is represented a piece of pruned Scotch Fir. Figure 5 is a portion of plank cut from such a tree. I imagine they will tell their own tale.

Reflections, and profitable ones too, were suggested in sketching these examples, and at some future day I may beg permission to lay a paper, in which I shall embody them, before the readers of the *Gardeners' Chronicle*. *G.*

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

(*Continued from p.* 53.)

The entrance gates to the kitchen garden, from the ornamental grounds, are very rich in pattern, scrolls and mouldings being carved on them in gold, and they are backed up by Taxus incurva and Gold Yews. It may be imagined that because so much attention has been devoted to ornamental gardening at Elvaston, the cultivation of fruits and vegetables has received little care; but this is not the case: indeed it would be difficult to point out another establishment of similar extent in which everything is carried out in greater first-rate excellence than at Elvaston. The kitchen garden occupies 8 acres, five of which are enclosed by high brick walls; the remaining 3 acres constitute the exterior borders. A range of five glass houses occupy a portion of the north wall; three of these are exclusively employed in producing Muscat Grapes, no other variety being cultivated at Elvaston. One house contains Peaches; another Peaches and Figs. The crops of Peaches and Figs were over when we saw them; but one house of Grapes still remained in splendid condition, the bunches were large, and the berries finely swelled, exhibiting the colour of a golden drop Plum. The Peach trees, Figs, and Grape Vines, all indicated the highest degree of fertility.

The Peach trees on the open walls at Elvaston were the finest we saw last season north of London, and the same may be said of the Apricot trees; indeed we may add that the Apricot walls contained the most perfect trees we ever remember seeing either in this country or on the Continent. They are beautifully trained after the fan fashion, and they bear abundance of fruit annually from the top of the wall to the ground; the whole extent of wall does not exhibit a naked spot nor the least evidence of gumming, a matter of such common occurrence all over the country.

A range of low houses or pits, having a walk along the back, is exclusively employed in the culture of Pine-apples; the latter are all planted out in the open soil, as at Meudon, where such fine examples of this fruit were produced. The plants showed great vigour, and some had magnificent fruit on them nearly ripe, while there were others in every stage of growth forming a complete succession.

We observed a novel mode of ripening the Green-gage Plum here. A border is raised, in the form of an inclined plane, considerably above the garden level; the trees are planted on this border, and it is then covered with tiles, over which a trellis of wire is stretched, a few inches from them. The trees are trained to this trellis, and it is found that, on account of the heat absorbed during the day, and given out in the night, as well as on account of the reflected heat under sunlight, the fruit is ripened with much higher flavour than it is by any other plan adopted here.

Mr. Barron uses a great deal of liquid manure in the culture of exotic fruits under glass; and in order that this may at all times be of the right temperature for immediate use, a hot-water pipe, connected with one of the heating apparatuses, is carried through the tank. This keeps the liquid at a temperature of 80° without any trouble, and with much advantage to the plants.

The kitchen garden walls are covered on both sides with wire trellises, by which the common practice of "nailing" is entirely dispensed with. The north side of one of the walls is covered with the Warrington Gooseberry and with Raspberries, the former being trained in a horizontal form, like a Pear-tree, and by this means the crops are easily protected until a late period.

On an exterior border, facing the orchard, is a raised slope at an angle of 17°. This slope is 150 feet long and 12 feet broad. The border is made of good loam, on which is spread an inch of gravel, and on this a coating of asphalte is laid on hot. Bricks rebated receive a wire trellis; these are firmly set in the gravel and asphalte, and over the latter is spread a coating of tar. On this border are trained Green-gage Plums, Apricots, Peaches, Figs, and the Male Carle Apple; the latter, managed in this way, bears good crops of excellent fruit. This Apple is but little known in this country, our climate being generally unfavourable to its perfect ripening. Mr. Barron stated that the fruits produced on this slope were superior in flavour to those from perpendicular walls. The advantage of a slope over a south wall is that, in the former case, the force of the solar rays is nearly trebled. Table trellises have also a decided advantage over the common espalier, and for the same reason.

As numbers of the walks in the gardens at Elvaston, as well as these inclined slopes, are covered with asphalte, let us state how that work is done. A foundation is formed of stones, brick rubbish, cinders, and ashes from the furnaces, the thickness depending upon what the walk is wanted for. If only for walking on, and not for heavy weights, 3 or 4 inches is considered to be sufficiently thick. A little gravel is then put on, just enough to make it somewhat even and smooth when the roller is passed over it. On this is laid, as hot as possible, a mixture of fine gravel or screenings, coal or gas-tar, and quicklime; when this is spread 1 or 1½ inch in thickness, and the roller IMMEDIATELY passed over it, the work is finished; but a little fine screenings of good-coloured gravel (caulk or the refuse of a lead mine is best) swept over it, and the roller again applied, effect a great improvement in its appearance. The mixture is made by making the gravel quite hot on a flat kiln, formed of sheet iron; the coal-tar being also boiled until the scum leaves it.

Four barrow-loads of hot gravel, one of quicklime, and as much of the tar as will moisten and colour the whole, are the proportions used. Some of these walks so formed have now been down several years, and they are quite smooth and sound. *R. G.*

(*To be continued.*)

Erratum.—In last article, col. *b*, line 14 from bottom, for "late Duke of Bedford," read "present Duke of Bedford."

NOTES OF A TRAVELLER.—No. VII.

The Bamboo, and the Uses to which it is applied in China.—The Bamboo, as you are aware, is one of the most valuable trees in China, and is used for almost every purpose. Having from time to time noted down the uses to which I have seen it applied, my list seems so amusing that I send it to you for the readers of the *Chronicle*.

Bamboo is used in making soldiers' hats and shields, umbrellas, soles of shoes, scaffolding poles, measures, baskets, ropes, paper, pencil holders, brooms, sedan chairs, pipes, flower-stakes and trellis work in gardens, pillows are made of the shavings, a kind of rush cloak is made from the leaves for wet weather, and is called a To-e, or "garment of leaves." On the water it is used in making sails and covers for boats, for fishing-rods and fish baskets, fishing stakes and buoys; katamarans are rude boats, or rather floats, formed of a few logs of Bamboo lashed firmly together, and launched upon the water. In agriculture the Bamboo is used in making aqueducts for conveying water to the land; it forms part of the celebrated water wheel, as well as the plough, the harrow, and other implements of husbandry. Excellent water-pipes are made of it for conveying springs from the hills, to supply houses and temples in the valleys with pure water. Its roots are often cut into the most grotesque figures, and its stems finely carved into ornaments for the curious, or as incense burners for the gods. The Ningpo furniture—the most beautiful in China—is often inlaid with figures of people, houses, temples, and pagodas in Bamboo, which form most correct and striking pictures of China and the Chinese. The young shoots are boiled and eaten, and sweetmeats are also made of them. A substance found in the joints called Tabasheer is used in medicine. In the manufacture of Tea it forms the rolling tables, drying baskets and sieves; and last, though not least, the celebrated chop-sticks—the most important articles in domestic use—are made of it.

Gentle reader, however incredulous you may be, I must still carry you a step further, and tell you that I have not enumerated one-half of the uses to which the Bamboo is applied in China. Indeed it would be nearly as difficult to say what it is *not* used for as what it is. It is in universal demand, in the houses and in the fields, on water and on land, in peace and in war. Through life the Chinaman is almost dependent upon it for his support, nor does it leave him until it carries him to his last resting-place on the hill side, and even then, in company with the Cypress, Juniper, and Pine, it waves over and marks his tomb.

At the time of the last war, when the Emperor of China, very considerately no doubt, wanted to conquer the English by withholding the usual supplies of Tea and Rhubarb, without which, he supposed, they could not continue to exist for any length of time, we might have returned the compliment, had it been possible for us to have destroyed all his Bamboos. With all deference to the opinion of his celestial Majesty, the English *might* have survived the loss of Tea and Rhubarb, but we cannot conceive the Chinese existing as a nation, or indeed at all, without the Bamboo. *R. F.*

DISEASES OF PLANTS.

(*Continued from page 54.*)

Genus XII.; Phylloptosis, *or Fall of the Leaves.*—Every year, as the cold season comes on, the greater part of our trees lose their leaves. This is a constant phenomenon, the explanation of which has been the subject of study and observation with many learned men, among whom none has written upon it with greater precision than Giovene in his Memoir inserted in the 13th volume of the "Memoria della Società Italiana delle Scienze." But on the present occasion I only allude to the occasional loss of foliage in the height of summer, or at the end of spring. Usually this disease is the necessary consequence of yellowness not cured. I have never seen plants lose their leaves without a previous change of colour from green to yellow, or to a white or reddish tinge. A sudden privation of light will cause the leaves to fall, so also the excessive heat of summer. Trees have been observed to lose them out of season most frequently in what are called light hot soils, which have been overmanured. The want of nutriment which occasions yellowness will also produce *phylloptosis*. Plenck assures us that in the neighbourhood of works where arsenic, cobalt, or oil of vitriol are prepared, the smoke issuing even from lofty chimneys will instantly destroy not only the leaves of trees, but all the herbage which covers the ground.

The same precautions which tend to prevent yellowness are also applicable to stop the fall of leaves. Although trees and woody plants are the most liable to this disease, it is also observed in herbaceous plants, especially Leguminosæ. I should be disposed to adopt the opinion, clearly explained by Giovene, who thinks that the fall of the leaf is always preceded by an induration of the part, and is thus, as it were, only the last but the most evident symptoms of the disease. And it is not difficult to conceive that induration should follow from the causes we have mentioned. The same circumstance will account for the fact that many of the branches, from which the leaves have thus prematurely fallen, will perish. For this reason we recommend strongly to cultivators to examine well in spring the trees which have suffered from phylloptosis during the last year, and to prune out all branches showing withered or ill-nourished buds. The cutting out sickly and weak branches in pruning is a point much neglected, but which we insist upon as most important.

VILLA AND SUBURBAN GARDENING.

Great attention has been paid of late to the cultivation of the Pear. The numerous varieties which have been introduced from Flanders, of first-rate quality, extending over a very long period in their season of ripening, render this fruit one of the most important in our gardens, and peculiarly so for the amateur; as almost every garden whose soil is of ordinary quality, and which has an aspect favourable for the production of common garden produce, will bring forward Pears in perfection. Under proper management, too, a considerable variety may be grown in a garden of very limited extent. When I speak of proper management I mean the converse of what is usually exhibited in small gardens; for we too frequently find two or three large trees overshadowing the limited spot of kitchen-garden, and these in a great measure destroy the value and quality of everything near them. The kinds, moreover, are generally anything but suitable for such gardens. The Autumn Bergamot, Williams' Bon Chretien, and the Jargonelle frequently occur in such situations, and where these sorts do bear a large crop of Pears, they are of comparatively little value, for they are over in a few days. Instead, therefore, of a bushel of one kind of Pear, this quantity in 10 kinds, ripening over a period of several months, would be much better.

The first point to consider is the stock upon which the Pear should be grafted. Considerable diversity of opinion exists on this head; some recommending the Quince, others again condemning it, and preferring the Pear-stock. My own opinion is that they are both good when the soil is suitable. Where the situation is naturally damp, the Quince will thrive; but where it is very dry and sandy, it will make little progress, and the fruit will be small and gritty. I have had ample proof of this myself. Common observation will therefore easily enable any one to determine whether the soil is suitable for the one stock or the other.

The mode of training is another subject deserving attention. If the espalier system is preferred, it must be remembered that it involves a considerable outlay in the first place, if a permanent railing of iron is erected; and if wooden stakes are employed, then these are constantly giving way and fresh ones are required; endless expense is consequently incurred. Dwarf standards, if properly managed, will obviate the use of these expensive props. If the ground is properly drained—an essential point as regards the flavour of the fruit, as well as the productiveness of the trees—they may be planted 8 or 10 feet apart along the borders, and crops of Lettuces and the lighter kinds of vegetables grown around them without effecting any very serious injury to the trees. In our next we shall furnish a list of a few kinds suitable for the amateur, with the system of management after planting. *Pharo.*

Erratum.—In the fourth line of the last article on Suburban Gardening, for "quickly" read "quietly."

TRADE MEMORANDA.

Will any one inform us who Messrs. George Boden, and Co., of Hindley-street, Ardwick, Manchester, are. This firm refers to W. Russell, Esq., 23, Russell-street, Chorlton on Medlock, Manchester; and Mr. George Higginbottom, Merchant, Heaton Norris, Stockport. Perhaps the referees will oblige us with the information.

Home Correspondence.

Victoria Regia at Chatsworth.—This interesting plant still flourishes here, and continues to expand its beautiful flowers, two of which have generally opened every week during the winter; these, however, are much smaller than those produced during the earlier stages of the plant's growth, the largest now seldom measuring more than 7 inches in diameter, whilst the first flowers measured nearly 11. Although for some time past the plant has appeared to enjoy a partial rest, yet its growth has never been suspended, a gradual production of leaves as well as flowers having constantly been taking place, but these leaves, when fully matured, rarely have much exceeded 2 feet in diameter, a small size compared with those unfolded during the plant's most vigorous growth, the diameter then reaching nearly 5 feet, and the succulent leaf-stalks which at that time, had they been allowed room, would have reached to an immense length, are now also greatly diminished in size, and seldom extend to more than 3 or 4 feet from the root. At the present time, however, the plant exhibits no symptoms of decay, but is evidently in the most perfect health; the growth also appears on the increase, the leaves develope themselves with more rapidity, and are becoming larger in size; and if we might form a judgment of future success by present appearances, a most vigorous growth may be anticipated in spring. All these expectations, however, may prove delusive; our knowledge of the habits of the plant is too limited at present to admit of our deciding whether it is really an annual, a biennial, or a perennial; the latter, however, we are inclined to lean to. Should it be found to be short-lived, we are happy in having been able to save a quantity of fine-looking seeds, some of which are already sown, and will probably prevent its being again lost to the country. The following statistical remarks on the state of the growth of leaves, and production of flowers, are a continuation of those given at page 742 of last year's volume; it will be seen by them that there are at the present time 15 leaves on the plant—that the 55th leaf is now developing itself, and the 25th flower-bud unfolding. *Joseph Paxton.*

[We hope to be able to find room for the statistical tables in a short time; for the moment we are unable to do so.]

Potatoes.—Plant good early kinds, for it is important to combine precocity and well selected varieties. Single eyes are best for producing early and fine produce. Objections to this rule, however, may be fairly urged, as by planting unusually early they are subject to rot; hence, as a preventive, planting whole sets has been resorted to. In either case, where practicable, plant them close in fleet drills, on a warm border in February, or on a slight hotbed in March, to be transplanted finally in open compartments late in April, or early in May. A small space will suffice to raise plants for a large garden. Those raised from single eyes should be transplanted with sets and roots entire. The plants from the whole ones should be slipped off, planted, and watered, no further nourishment being now necessary from the parent tuber. The top shoot may be left on, and planted with the whole set in small shallow drills. Another, and perhaps the chief, advantage of thus raising Potatoes in advance, is that during the dry months of March and April, opportunity will be better afforded in bringing the ground for their reception into the best condition. These remarks also apply to raising Potatoes early from selected seed. *Hardy and Son, Maldon.*

Agapanthus umbellatus.—"A. H." will find it hardy enough to withstand our winters in the open border, merely protected by a hand-glass. It has been growing here with the above treatment for these last 20 years at least, and there is now a bed of it consisting of nine plants, which give annually from 30 to 50 umbels of flowers that remain in great beauty for weeks: the soil is a deep, well-drained loam. *J. G. Nelson, Winterton Rectory, Great Yarmouth, Jan. 23.*

Rats.—Every one who has read Mr. Kidd's lamentable narrative of the destruction by rats of his beautiful and unique aviary, will deeply sympathise with him. The loss is not only great to himself but to all who love Nature and the sweet music of these winged choristers. We are well acquainted here, rather too well, with the predatory and carnivorous habits of the English rat, having lost many hundred head of poultry by their destructive agency. In a single night rats will carry away a dozen chicks. They are well known to come at night and take young chickens from under their mother's wings, and carry them away bodily. And I have seen an instance of the hen pursuing the rat that had so abducted her offspring. If Mr. Kidd had laid down a bed of shingle or rough gravel, from 6 to 10 inches in depth beneath the floor of his aviary, no rat could have reached him: they cannot burrow in shingle. Being near the coast, where it is easily and quickly obtained, we laid it beneath the floor of a barn here, and it effectually kept these vermin out. Harrison's pills are excellent, only they must be fresh when used; but a rat that has tasted flesh, and has a chance of finding more, will not stop to eat pills or corn of any kind. The only method of exterminating rats is with ferrets and terriers; the country around us swarms with these vermin; they come from the fields, hedges, and copses. For months past we have by these means kept up a constant warfare, and have caused nearly 200 of them to bite the dust. *X. Y. Z., Hants.*

Roses.—Will "Crito" be good enough to give us the names of those Roses which he considers "promising?" I do not mean that he shall be pledged to do so, but simply that he should give us an opportunity of trying, at the same time that he does, those varieties that he thinks there is reasonable hope may come near his notions of continuous bloomers, and especially as it would enable us to save a season with all those that do turn out well. I, for one, would try them all, and report the result. *Amicus.*

Pear Moths.—I have read the articles in your last three numbers upon the habits of the larva of Batodes angustiorana, by my friends Mr. Curtis and Mr. Westwood, and I wish to make a few remarks upon the same subject. I have never raised this insect from the larva myself, but I must quite dissent from Mr. Graham's opinion, that the rind of the Pear is the common food of the larva; that it will eat it I do not doubt, but I believe it to be purely accidental. Any person who has paid attention to the larvæ of the various Tortrices which feed upon the Apple tree, must have noticed that they often spin a leaf to the fruit, and the larva then feeds indiscriminately upon the leaf or the rind of the young Apple, and I have little doubt that this was the case with the larvæ of B. angustiorana, found by Mr. Graham upon the Pears, although it is possible that having found the calyx a convenient habitation, it might feed entirely upon the rind of the fruit. Still I am quite certain that this insect feeds more commonly upon other trees than it does upon the Pear. In my own garden it swarms upon a hedge composed of Privet and Whitethorn; on the opposite side of the path is a Laurel hedge, and upon this it is equally abundant; there is only one small Pear tree near the spot, and on this tree I never saw the insect. In Hainault Forest it abounds upon the Oaks, in spots where

there is no other tree except the Hornbeam. My own opinion is, that the larva is a general feeder upon the leaves of trees—that it forms a web in the autumn in which it passes the winter, and reappears in the spring to feed upon the buds of various trees. Mr. Graham seems quite to forget that the larvæ of many species of Lepidoptera live through the winter without food, and there would be nothing extraordinary in the larva of Batodes angustiorana living in a tumbler during the whole of that season without feeding. I have kept the larva of Boarmia repandaria in a pill-box from October to March, during which time it had not a particle of food. If those caterpillars which naturally pass the winter in a semi-torpid state are kept in a room at a temperature of 50°, or higher, and can be supplied with proper food, they will sometimes continue feeding, and the perfect insects will appear two or three months before the usual period, but they will more often perish just as they have attained their full growth. I may just say, in conclusion, that the larvæ of Carpocapsa pomonana, which feed in the Apple, quit the fruit in the autumn, and form webs under the rough bark of the tree. In this state they remain quiescent till the end of May in the following year, when they change to pupæ, and in 14 days the moth appears. *Henry Doubleday.*

Skimmia (*Limonia*) *Laureola.*—Arguing from analogy, there can be no doubt that Limonia laureola would be perfectly hardy in any part of England, if planted in a well drained sheltered locality. I have seen it growing in many parts of the Himalayas. First of all, flowering in April, surrounded by large patches of snow, on the north side of the mountain Chena, near Nynee Tal, at least 8000 feet above the sea, and above Cupressus torulosa, which grows in great abundance on the south side of the same mountain. The surrounding plants were Gagea, Fritillaria, Convallaria, Anemone discolor, and Primula denticulata. I then found it at Patternullah, 9000 feet, in May, and shortly afterwards at Phagoonimly, 9000 feet, not far from Simla; growing associated with Lonicera angustifolia, which has stood the present winter very well. You are mistaken about the flowers not being scented. They are deliciously and powerfully fragrant, so as to perfume the air to some little distance. The leaves also, when bruised, are strongly scented; so much so, that the plant always bears amongst the inhabitants the local native name for musk, as indeed is mentioned by Dr. Royle, at p. 130 of his "Illustrations of the Botany of the Himalayas." I have always observed the plant on the northern sides of the mountains, where it is sheltered from strong winds. There appears to be considerable doubt about the real genus and even natural order of the plant, which is decidedly polygamous. Wallich calls it Laureola (Aurantiaceæ), you call it Skimmia (Ilicineæ?), and Decaisne has figured the same species in "Jacquemont's Travels," fig. 161, as Anquetellia laureola (Zanthoxyleæ). *William Munro, Jan.* 29. [The discovery of this plant being really a species of the little known genus Skimmia, was we believe made by the late Prof. Zuccarini.]

Half-hardy Plants.—I may state that during the sharp frosts of November last, I had in the open ground, well sheltered, two magnificent specimens of Veronica speciosa, and several very fine old tree looking plants of Fuchsia Eppsii. The whole were in such full vigour and bloom, that at night I gave them the protection of a mat, &c. Nevertheless, my poor Veronicas that had stood through the previous winter without damage were killed nearly to the ground. The Fuchsias were entirely destroyed, as well as some seedling Acacias from New Zealand, from 4 to 5 feet high in pots, and under the cover of a warm summer house. The thermometer in the morning indicated 9 degrees of frost. *W. V., Bembridge, Isle of Wight.*

Evergreen Berberries.—In Dr. Lindley's paper on this subject, in the Journal of the Horticultural Society, vol. 5, part 1, it is stated, in describing Berberis trifoliata, that "the fruit has not yet been formed in this country." In 1848 a plant growing against a wall at the Deepdene ripened several berries, from which, however, I failed in procuring plants. They were small in size, round in shape, and of a light red colour. Neither the fruit nor the flowers add much to the beauty of the plant, which is certainly one of the handsomest evergreen shrubs we possess, when trained against a wall. Whether it it hardy enough to make a good border plant remains, I believe, to be proved. *J. B. Whiting.*

Fuchsia spectabilis (*the Queen of Fuchsias*).—In May last I received from Messrs. Veitch's four plants of this fine Fuchsia, of which the accompanying woodcut is a representation. Two of them were soon sold, and of the remaining two I lost one, and was shortly afterwards informed of the decease of the two I had sold. In justice to Messrs. Veitch, however, I should state that upon my employer representing these facts to them they immediately made good his loss. The first plants were much mildewed, which no doubt caused their death. I have succeeded in preventing its spread by applying sulphur, which is the only antidote against mildew that I know of. This Fuchsia strikes with me as freely as any other sort; the soil I employ for it is a mixture of two parts loam, one of peat, and two of leaf-mould, with a sufficiency of pure white sand to keep the whole porous, but any light sandy soil will do to root them in, provided the above compost is used for potting them off in. After the cuttings are rooted, I pot them in thumb-pots, and place them under a handlight in a house where the temperature ranges from 55° to 60°. I find that, like all other Fuchsias during their growing season, this delights in a moist atmosphere. I have a fine healthy plant of it struck from a cutting last July, which is now 1½ foot high. I have continued to grow it all the autumn, not allowing it any rest. When my young plants have made roots enough, I repot them in a size larger pot, and as they increase in size I use well decomposed dung in the soil, instead of leaf-mould. Treated in this manner they grow as freely as any other Fuchsia; in fact, by the last week in March I shall have upwards of 500 plants of it. I intend to remove them about the middle of May into a greenhouse or cold pit, but I shall take especial care to keep the atmosphere as moist as possible. From the present

appearance of the plant I should say that it will require much the same treatment as F. serratifolia. *E. Fancourt, St. John-street Nursery, Colchester.*

Societies.

Entomological, *Jan.* 7. *(Obituary of Mr. Edward Doubleday.)*—G. R. Waterhouse, Esq. President, in the chair. After the ordinary routine business of the evening had been completed (including the announcement of the changes proposed to be made in the council and officers at the anniversary meeting on the 28th inst.), the President announced that, as a mark of respect to the memory of the late Edward Doubleday, Esq. (who had for two years past performed the office of secretary to the Society), no scientific business would be taken into consideration at the meeting.

We therefore take this opportunity of presenting to our readers a short summary of the life of this lamented entomologist, snatched from us in the midst of his labours and in the prime of his life. He was born on the 9th October, 1810, and was the descendant of an old and well-known Quaker family long residing at Epping. It was not until the establishment of the "Entomological Magazine," in 1833, that he appeared before the public as the author of various articles upon entomological matters; since which period he was a constant and extensive contributor to the literature of the science. His articles in the early volumes of the "Entomological Magazine" are of a general character, or consist of notices of the habits of insects, interspersed with ornithological scraps, and mingled freely with classical quotations and notes, resulting from an extensive reading of early Spanish literature, of which he was a devoted admirer. In 1835 he undertook, in conjunction with Mr. Foster, another member of the Society of Friends, a natural history tour through the United States of America (to the institutions of which country he was much attached), and many of his notes made during this tour were published in the later volumes of the Entomological Magazine, and fully prove his unbounded admiration of the works of Nature. Up to the period of his decease (which took place on the 14th of last December) he sincerely longed to revisit the scenes in the New World which, whilst there, he had so much loved. During this tour he made large collections of specimens in all branches of natural history, which on his return he freely distributed among his friends and various public institutions. In 1841 he was appointed assistant in the zoological department of the British Museum, where his time was chiefly occupied in the arrangement of the entomological collections, more especially the Lepidopterous insects, which now constitute one of the finest series of specimens of that order in existence. His publications, since the period of his connection with the British Museum, have been almost confined to the insects of this order, and have appeared in the "Annals of Natural History," the "Entomologist," the "Zoologist," and the Transactions of the Linnean, Zoological, and Entomological Societies. In 1848 he commenced, in connection with Mr. Hewitson, the publication of a splendid work upon the genera of butterflies, of which it is greatly to be regretted that scarcely more than half has appeared. The minute analysis of the obscure characters of the genera of diurnal Lepidoptera contained in this work is deserving of the highest praise. He also compiled an excellent synonymical catalogue of the diurnal Lepidoptera, in the collection of the British Museum. Personally, Edward Doubleday was open-hearted, with an utter aversion to quackery, or moral delinquency, wherever he thought it existed. Precipitate, however, in his judgment, and regardless of what the world deems caution, he occasionally placed himself in positions which entailed upon him much subsequent annoyance, as was the case when he took up the part of his friend Stephens against Rennie, in Loudon's "Magazine of Natural History."

In addition to his other acquirements, he possessed an excellent knowledge of British plants, and was a Vice-President of the Botanical Society. We have before us one of his latest letters, written from Sevenoaks shortly previous to the attack of paralysis which (after several months of acute suffering) ended his mortal career; and as it is highly characteristic of his love of Nature, we will close this short notice of him with an extract from it, premising that it was written whilst labouring under very severe pain, and yet it is playfully dated, "7 Querci 1.6.49." and after stating that he had tried to walk off an attack which was supposed to be sciatica, he adds "*Nota bene:* There is here a Hawthorn 7 feet 3 inches in circumference; I had no idea of the beauty of the country." We believe, in conclusion, that we speak the unanimous opinion of the naturalists of this kingdom, in asserting that the death of Edward Doubleday is one of the most severe losses which zoology has sustained, in this country, for many years past. *J. O. W.*

Reviews.

The Cabinet Lawyer: a Popular Digest of the Laws of England. Longmans. 12mo, pp. 714.

The fact of the present work having reached a 15th edition, sufficiently shows that it is not without its use. Let not the public however imagine that they will find in this popular digest of the laws of England, an accurate statement of the law on any given point; such neither is nor can be the case. The law of England in its present state is comprised in some 70 or 80 octavo volumes of statutes at large, and about 10 times as many volumes of reports. To condense these into a work of 700 pages, is manifestly impossible. The use of all such digests as the one now before us, is to enable a common person to understand what questions he should put to his solicitor, in cases of legal difficulty, and not to enable him to solve such cases himself; that he can only do by devoting his whole time to the study of the law. "I wish" says Lord Bacon, "every man knew as much law as would enable him to keep himself out of it;" but if our readers act upon the knowledge to be acquired from any popular digest, however ably edited, they will find to their cost that they have acquired just enough law to lead them further astray than they would otherwise have gone.

Miscellaneous.

Botanic Garden, Calcutta.—We learn that Mr. Scott, of Chatsworth, has been appointed head gardener of this great establishment. His merits, as evinced in the admirable cultivation at Chatsworth, are too well known to require comment. Mr. Scott was recommended by Mr. Paxton and Mr. Gibson, of Chatsworth, Messrs. Low, Messrs. Knight and Perry, Mr. Henderson, gr. to Earl Fitzwilliam; James Yates, Esq., F.R.S.; Dr. Moir, of Aberdeen, and others. Mr. Scott was a candidate for the Neilgherry appointment, for which Dr. Falconer and Dr. Royle selected Mr. Scott and Mr. M'Ivor, as having the best claims. It was thought, however, that a man accustomed to the luxuries of Chatsworth would

be ill-placed on the Neilgherries, where there was little either of garden or gardeners; and therefore as Mr. M'Ivor seemed a young man full of energy, and was both scientific and practical, he was preferred on that occasion, and his excellent conduct since his appointment has fully justified the expectations formed concerning him. That Mr. Scott should have had the offer of the first higher vacancy under the Indian Government, shows the estimate formed of his skill as a gardener by the authorities at the India House.

Annual Meeting of Florists.—The annual meeting of florists and amateurs, which has been discontinued two or three years, was resumed on Wednesday last, after the close of the election, and was held at the rooms of the Society for the Encouragement of Floriculture, Mr. Glenny in the chair, supported by Messrs. Keynes, of Salisbury; Turner, of the Royal Nursery; John Edwards, Esq.; and other florists and amateurs. Arrangements were made for various provincial shows to keep clear of each other. After the usual toasts, the chairman called the attention of the meeting to what union had done for floriculture in 1832, and continued to do for it until the apple of discord was thrown among them, since which it had gradually gone back; and, after urging all to forego all minor considerations, and keep in view only the one great object, the advancement of the science, proposed "Success to Floriculture," which was drunk with great spirit. *Abridged from the Country Gentleman.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Forcing-house.—The main thing to be aimed at is to render the artificial temperature, and other circumstances, as nearly proportioned as art and ingenuity can make them, to those in which the plants naturally flourish. As summer is the season to be imitated, when the sun's rays have the greatest power, the structure used for plant forcing should be of the lightest possible description; painted or coloured white inside; and the plants set on or plunged in white gravel or light-coloured sand; that the greatest possible amount of light may be diffused and reflected amongst their foliage. The glass and laps should be perfectly clean. The ventilators should be so arranged that the air may be admitted under the pipes, and thus warmed to the temperature of the house before it comes in contact with the plants. Top air should be given by opening every sash a little, in preference to admitting the same quantity in several large currents. As the flowers expand, the plants should be removed to a cooler and drier atmosphere, with a view to prolong their period of blooming. It should be remembered that forced plants require a greater supply of water than the generality of plants at this season; and when they are in a fit state to receive water, let sufficient be given to moisten thoroughly every part of the soil. Excepting in very dull weather, the syringe may be used with advantage once a day upon those plants whose flowers have not yet expanded. Use water of the same temperature as the house for this purpose as well as for watering the plants.

FORCING DEPARTMENT.

If the early sown Melon seed has germinated successfully, a bed should be immediately prepared for them. By the method which I am about to describe, I have for many years had the greatest success in cultivating the choicest kinds, and especially those Persian varieties which are so often complained of as difficult to manage. Hot water pipes supply my pits with top and bottom heat; the latter of which ascends to the soil through a bed of rubble. On the surface of the rubble, 6 or 8 inches of turfy soil is laid, which, after being soaked with water, is pressed into a solid mass; this is made smooth with the back of a spade, some guano is sprinkled over it, and then the hills are put in, preparatory to planting. My reason for adopting the above process is to form a compact mass of soil, which will be filled with the ramifications of the roots by the time the first fruits have completed their swelling; and by piercing the soil with a tin tube, water is conveyed to these roots, during that critical period, without wetting the surface soil or producing any moisture in the house, by which the quality of the ripening fruit would be deteriorated. The healthy vigour of the plants is thus maintained, and with the assistance of a couple of rich top dressings they are kept in a fruitful state for six months.

FLORISTS' FLOWERS.

Those who were fortunate enough to save seed from their choice Ranunculuses should now think of sowing. Let them get earthenware pans, or wooden boxes will do, 5 or 6 inches deep; for at least 2 inches a quantity of good drainage must be put, and on this the compost, of leaf soil and sandy peat, filling either box or pan within half an inch of the rim. The compost must be pressed evenly down, and then well watered, so that the soil may be soaked through; this should be done the evening previous to sowing. The seed (which is generally full of husks), should be spread very thickly on the surface, pressing it down and then covering lightly with the same compost. The pans may then be put in a close cold frame; after a few days give them air, which may be continued for the present. Carnations and Picotees.—After the long frost that we have had, the first thing we would recommend is a general supervision of the stock; let some one go over them, pot by pot and plant by plant. Dead and yellow leaves must be removed, the surface soil loosened, and, in fact, the plants should have a regular dressing, the last previous to their final potting. We would also recommend that the soil for this purpose should be put under cover, not only to preserve it from the action of the atmosphere, but also that on rainy or other days it may be carefully turned, and ready any moment.

HARDY FRUIT GARDEN.

Any Peaches or Nectarines on the open walls, which have any show for fruit, should be protected, if this has not been attended to. Among the espalier fruit trees, the flower buds of many of the hardier kinds will soon be swelling; and as we may yet expect some severe weather, prudence points out the propriety of protecting anything which is choice or valuable. For this purpose nothing is cheaper than Spruce or Yew branches, which are also of considerable service in retarding the opening of the blossoms, until the time of the year is more favourable for their safe development. The ground should be forked over amongst bush fruits, taking care to injure the surface roots as little as possible, as the fertility of the tree depends mainly upon these. The Strawberry beds should also be looked over, the dead leaves and runners removed, and if it was omitted last autumn, the plants should be thinned when they require it. Some dry soot should now be dusted in amongst them, to destroy snails; after which, the spaces between the rows should be manured and lightly forked over without breaking their roots.

KITCHEN GARDEN.

A crop of Peas should now be sown in turf, and raised in a little heat, to be planted out about the middle of March. The most economical way of doing this is to cut strips of turf 4 or 5 inches wide, and lay them on boards with their grassy sides downwards; a drill is then to be made along the middle of the turves by pressing a strip of wood into them; and in this the seeds are to be sown and covered with a little light soil. The boards may be placed under the trellis of a Peach-house, or in a similar situation, where the night-temperature does not exceed 50°. As soon as they are up they must be fully exposed to the light, and towards the end of the month they will be sufficiently advanced to be placed out of doors. The best situation is under a south wall, where they should be protected by a few branches of evergreens until they are thoroughly inured to the open air, which must be done by gradually exposing them. The variety which I have found best adapted is Bishop's Long-podded; make a sowing of the same kind on an open sunny border, and also of Fairbeard's Champion of England, which may be sown once a fortnight from this time till the middle of June. This is a fine flavoured Pea, and an excellent cropper.

State of the Weather near London, for the week ending Jan. 31, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 9th 1831—therm. 62 deg.; and the lowest on the 9th, 1847—therm. 4 deg.

Notices to Correspondents.

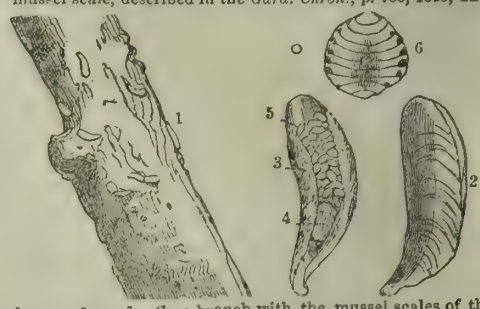
Annuals: *Glasconian.* Next week.‡

Books: *Progressionist.* Works on microscopic fungi are not very plentiful. Our best is the last volume of Smith's "British Flora," without plates. For plates, take Corda's "Icones," in five or six volumes folio. Pritchard on Animalcules may possibly suit you.

Camellias: *X Y Z.* Place them in a *gentle* heat, and they will swell their buds.‡

Chalk in Gardens: *Humus.* Your light shallow soil will be much improved by a heavy dressing of chalk and clay, one part of chalk to two of clay. On no account add lime to a compost heap, but apply it directly to the surface of the soil.

Clianthus puniceus: *E F L.* With ordinary care it may be removed with safety now.‡



Emigration: *N E.* We cannot, as we have often stated, take upon ourselves the responsibility of recommending colonies to our correspondents. They must judge for themselves; for which purpose they must read the books on emigration now published at a low price. Should you go to New Zealand, however, we should advise you to go there direct by one of the New Zealand Company's ships.

Gardening a Profession: *Elpidophorus* must excuse us for not carrying this matter further. He has expressed his opinion; we have offered, not we hope discourteously, our own. He is unconvinced by our arguments; we are *more than ever* dissatisfied with his, except such of them as support our view, although produced for the purpose of baffling it. We agree in some of what "Elpidophorus" now states; but we regard that part of his letter as being irrelevant, and we much dislike the tone in which the whole is written. Since we cannot insert the reply from "Elpidophorus," we also omit some very good and temperate letters addressed to us by gardeners themselves.

Gladiolus gandavensis: *The Original Raiser* of this variety would thank some of our readers to inform him what difference there is between it and Brenchleyensis? He states that the reported history of the latter is that it was raised between oppositiflorus (always miscalled in England floribundus) and natalensis; but that, he adds, is the exact parentage of gandavensis, oppositiflorus being the female parent. He has never succeeded in getting a (certain) crossed seedling between these two plants in the converse direction, or with natalensis for a mother. Last year he had at least 20,000 seeds, which ought to have produced this cross, but only one grew, and that is yet too young to flower.

Heating: *A B.* You will not get a flow in the manner you propose. Keep the gutters level. Let the end next the boiler proceed from the top of the boiler, and connect the other end of the gutter with the bottom of the boiler by a perpendicular pipe. Iron gutters are cheaper and better than leaden ones.

Insects: *H G B.* Your Pear trees are attacked by two different species of scale insects—a large globose one, and the small mussel scale, described in the *Gard. Chron.*, p. 736, 1843, and

here re-figured. (1, a branch with the mussel scales of the natural size; 2, the scale magnified; 3, the same seen from beneath, showing the mass of eggs and the shrivelled body of the female, which is still more magnified at 6.) The worst affected parts ought to be pruned out, and the others washed with hot water. *W.*

Lawns: *G R S.* As soon as February is well advanced lay down your lawn with the following seeds per acre:—1 lb. of Avena flavescens, 6 lbs. of Crested Dog's-tail, 3 or 4 lbs. of Hard Fescue, 20 lbs. of Rye-grass, 6 lbs. of white Clover, and 2 or 3 lbs. of Poa trivialis. If you find this too expensive reduce the quantity of Avena, Dog's-tail, and Rye-grass; less of all will do if you are in no hurry. This kind of lawn is for regular mowing. Above all things take care that the land is clean, the seeds pure, and the surface perfectly level.

Lisianthus Russellianus: *Sub.* Sow it every spring, and flower it in the following year.‡

Microscopes: *S A.* We are unacquainted with the "Student's." If it is achromatic, with ¼ inch object glass, and *is well* made, it will answer for most purposes in botanical anatomy. But if you want to study systematic botany well, such an instrument is useless, because you cannot dissect under it.

Names of Fruits: *Albert.* 1, Bedfordshire Foundling; 2, Alfriston.‖—*H D.* King of the Pippins.‖

Names of Plants: *Erzeroum.* 353, Sagittaria sagittifolia; 176, Cotoneaster vulgaris; 192, Sanguisorba officinalis.—*A Young Beginner.* The leaves may belong to Solandra grandiflora, but it is not certain. You seem to manage it properly, but perhaps you cut it back too much and keep it too cool while growing. Flower your Gardenia radicans without shifting it. The heat of a Pine bed is not too high for G. florida, provided it is damp enough; it will probably flower there.—*John Fryer, jun* The "seeds" are the grains or minute seed-vessels of the common Self-heal, or Prunella vulgaris, found everywhere in pastures.

Old Seeds: *Const. Reader.* Some will grow, others will not. You had better test them in the following manner: Sow 20 seeds (100 is the usual quantity), of each sort in a pot of nicely prepared soil, covering them sparingly with earth, and place them in a moderate hotbed. When they are up count off those which are living, and the difference will show the quantity of bad seed. If the seed does not grow more than 25 per cent. it is inferior, but if from 50 to 70 per cent., it may be considered good, as some allowance must be made for seeds saved before being fully ripe, &c.‡

Plumbago Larpentæ: *Edina.* To make a "specimen," start your Plumbago in a rather warm greenhouse about the middle of February. After it has begun to grow vigorously, give it a liberal shift, using a mixture of peat, loam, leaf-mould, and a little sharp sand. As it grows, tie the branches out nicely, so as to admit all the air and light possible to the centre of the plant. When in flower, place it in a rather shady situation, unexposed to direct currents of air.‡

Polmaise Heating: *J S M.* We entirely agree with you. Nothing can be more admirable than the sentiment "Turpe est aliud loqui, aliud sentire; quanto turpius aliud scribere, aliud sentire." But we fail to see its application in this case. We have always expressed our opinions freely enough; when we have seen reasons to change them we have said so, but we do not feel inclined to throw them overboard against our conviction. Polmaise and Arnott stoves may be compared with each other very profitably by those who are interested in the comparison.

Rochea falcata: *Sub.* It is a common greenhouse plant, requiring merely to be kept free from frost.‡

Roses: *W C.* William Jesse and General Allard are not suitable for the south front of a house which is required to be covered to the height of 12 feet. Any of the following will answer your purpose. *Bourbon:* Madame Lacharine, flesh; Marquise d'Ivry, pink; Pierre de St. Cyr, rose. *Noisette:* Desprez, buff and yellow; Fellenberg, crimson; Solfaterre, yellow.‡

Rough Plate Glass: *J P H C.* We cannot see the difference you mention. Hartley's is equally rough on each side—common cast is not. We are, however, trying some experiments, which we hope to report upon very soon, if we can get some sunshine. In the last Leading Article there is a misprint of *cent.* for *cwt.*, which pray correct.

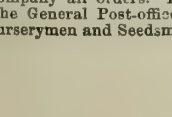
Thermometers: *F H.* The thermometers employed for registering the maximum and minimum temperatures at Chiswick, are according to Rutherford's construction. When subjected to the same steady temperature, the indications of the mercurial and spirit thermometers exactly correspond throughout the range of their scales. It must, however, occur that when the temperature is rapidly rising or falling, the mercurial and spirit thermometers will exhibit a slight difference, unless they are equally delicate; but the difference certainly ought not to amount to one or two degrees, as in your case. A short period of steady temperature should bring them to exact correspondence; if not, at once return them to the maker. The lowest indication of any common registering thermometer is not quite the lowest temperature of the air when the latter suddenly rises after reaching the lowest point.‖

Winter and Spring Flowering Cool Greenhouse Plants: *Sub.* Camellias, Daphne indica rubra, Erica hiemalis and gracilis, Styphelia tubiflora, Leschenaultia formosa, Chinese Primulas, Cinerarias, Cyclamens, Van Thol Tulips, Narcissus, &c ‡

Misc.: *Tutus quo.* The Venus's Fly-trap does *not* digest flies. We cannot answer the other question. If "J. L. S." sent any letter it was either printed, or rejected for some sufficient reason. We cannot undertake to answer such inquiries, even if made at the time, instead of twelve months afterwards.—*Amicus.* We know nothing about Pinus Wilkinsonii. ‡—*W V.* Sow your New Zealand seeds at once, in gentle heat.‡

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.
Factory, 28, CLAPHAM ROAD PLACE, LONDON.

CORN MANURE.



BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.
PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees of Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

GUANO AND OTHER MANURES.

PERUVIAN GUANO of the finest quality (as imported by the Contractors) on Sale; also Superphosphate of Lime, Gypsum, Nitrate of Soda, Salt, and all other Manures of known value.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
London, February 2.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.
GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
BENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.
HEATING BY HOT WATER.

THE IMPROVED "FLUE BOILER" AND FURNACE.

W. HILL begs respectfully to inform the numerous applicants for his "FLUE BOILER" of a small and intermediate size, that he shall be prepared, early in December, to supply sizes to suit every description of Apparatus, from that of 100 feet of 3-inch pipe to 2000 feet of 4-inch pipe. A List of Sizes and Prices will shortly be published. W. HILL guarantees his Boilers to be the most effective and economical of any in use.
Horticultural Works, Greenwich, Feb. 2.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences. Wire-work, &c.

PERUVIAN BARLEY.—This wonderfully productive species was imported by the Earl of Lonsdale in 1847, and promises to be of more real importance to the Farmer, the Maltster, and Brewer, than any grain hitherto introduced. It is scarcely possible sufficiently to eulogise its merits, which have been proved of so high a class that it must eventually supersede all other Barleys, and become an indispensable addition to our cereal crops. Its Malting properties have been found very superior to all other kinds, producing Beer of a much better quality. For Feeding it is inestimable; the grain having no husk whatever, it yields quite as much meal as Wheat, and closely approaches it in quality. Sown in February on his lordship's farm at Barnes, Surrey, on ordinary land, in 1849, it produced 9 quarters to the acre, weighing 64 lbs. to the Bushel. Messrs. J. and C. LEE, sole proprietors of the PERUVIAN BARLEY, being desirous that so invaluable an article should be widely distributed, are prepared to send it out in parcels containing 1 peck each for 10*s.* A remittance must accompany all orders. Post-office orders to be made payable at the General Post-office. — Address, JOHN and CHARLES LEE, Nurserymen and Seedsmen, Hammersmith, London.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

NATURAL GRASS SEEDS, FOR PERMANENT PASTURES, AND IRRIGATED OR CATCH MEADOW.
Which may be had Separate, or Mixed, expressly to suit the soil.
MESSRS. JOHN SUTTON AND SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of various kinds of Grasses which grow naturally in the various soils of England and Wales, for the purpose of introducing an improved system of laying down land to permanent pasture, are thereby enabled to supply the sorts and quantities of Seeds best adapted to suit the soil for which they are intended; and *at much less expense* than is usually incurred.
Also Finest Lawn Grasses and Mixtures for improving old Pastures. Ashcroft, Liverpool, and other Swedes, White Belgian and other Carrots, Yellow Globe and other Mangolds, True Italian Rye-grass, Drumhead Cow Cabbage, Kohl Rabi, &c.
Reading Seed Warehouse, Reading, Berks.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING
Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.
At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by
HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,
And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.
It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.
PRICE ONE PENNY PER SQUARE FOOT.
*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.
☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are
F. M'NEILL AND CO.'S
Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.
The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.
NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.
Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

The Agricultural Gazette.

THURSDAY,	— 14	—Agricultural Imp. Society of Ireland.

FARMERS' CLUB.—Feb. 4: London.

"AGRICULTURAL ECONOMY—THE ANTIDOTE TO AGRICULTURAL DISTRESS." This is the title of a pamphlet addressed to the farmers of Wales in 1838,* but which may be made useful by all farmers now. It was intended especially for small farmers, but the truths it urges are equally applicable to occupations of larger extent.

Its subject is one to which we shall continually recur, because we believe that the agriculturist can maintain his position only by lessening the cost relatively to the amount of his produce. But, knowing at the same time that no single item of his outlay is equal in amount to that which he pays for rent, we are also ready to insist on the reasons why that, as well as the other particulars of agricultural expenditure, should fall. Certainly no topic is more obviously a part of agricultural economy than that which includes the whole relationship of landlord and tenant; for there is nothing on which the whole business of farming, with the profits derived from it, so clearly depends, as the proportion between the tenant's capital and his occupation on the one side, and the cost to him of that occupation on the other. And while we have no doubt that the natural course of events will ultimately cause both of these particulars to accommodate themselves to the prices of agricultural produce, at rates compatible with the usual agricultural profits, yet we have as little doubt that, if prices were to rule permanently low, the process will be one of much suffering and injury to the parties concerned. And we submit, that if agricultural writers, instead of deprecating high farming and advocating retrenchment of expenditure, were to deprecate careless farming and advocate retrenchment of occupation; if they could induce the multitude who are now so justly anxious about the future, at once and together to give their landlords notice to quit, offering at the same time to retake about one-half the extent they at present respectively hold, we should arrive at once, and not through years of suffering, at the circumstance, as between landlord and tenant, and between tenant and land, which will enable agriculture, at the lower prices of its produce, to yield, nevertheless, the ordinary profit upon its processes. Land of present quality would be immediately to be had at less than its present price; and the larger acreable capital invested in its cultivation would enable the prosecution of a true economy in the manufacture of food.

What this true economy is, let any intelligent farmer answer, who knows, for instance, the large proportion of the wages he pays as the reward of time rather than of labour—the small proportion paid for "piece work," which is the only method of payment to insure work being done, or the amount of the costly item of horse labour per acre of arable land: let *him* answer who knows how manure ought to be made and cared for, and what proportion of the matter provided for the enrichment of the soil actually finds its way to the brooks and the ditches. Let any one run over in his mind the details of seeding, of plant cultivation and harvesting, and especially of the meat manufacture—and consider what waste of the raw material, what expensiveness of management obtains here, and he will see many a method which existing means enable by which produce may be largely increased, to meet a lower price.

We have been supplied by an Essex farmer—a well known public man, and good agricultural authority—with the following statement of the cost of cultivating 100 acres of arable land of average quality in Essex, upon the four course or Norfolk system of cropping, viz., one-fourth fallow crop of roots, &c., one-fourth Barley or Oats; one-fourth Clover, Peas, or Beans; one-fourth Wheat.

	£	s.	d.	£	s.	d.

				36	0	0
25 acres seed corn, 48 bushels Wheat, 5*s.*	12	0	0			
25 acres seed corn, 80 bushels Barley and Oats, 3*s.*	12	0	0			
25 acres seed corn, 36 bushels Peas or Beans and Clover	10	5	3			
				34	5	3
25 acres green crop—10 acres Mangold Wurzel and Swedes, for seeds	1	10	0			
10 acres white Turnips, for seeds	0	15	0			
5 acres Vetches, ditto	4	0	0			
				6	5	0
Interest on invested capital that does not deteriorate, 500*l.* at 5 per cent.	25	0	0			
Interest, and for wear and tear on 500*l.* stock that deteriorates, 10 per cent. ...	50	0	0			
				75	0	0
Tenants' superintendence and labour				50	0	0
				£631	4	9

Statement of Produce on a farm of 100 acres of average land of mixed soil in Essex, under favourable circumstances of season, &c.

	Per acre. £	s.	d.	£	s.	d.
25 acres Wheat, at 30 bushels, at 5*s.* ...	7	10	0	187	10	0
15 acres Barley, at 40 bushels, at 3*s.* 6*d.*...	7	0	0	105	0	0
10 acres Oats, at 48 bushels, at 2*s.* 3*d.* ...	5	8	0	54	0	0
12½ acres Peas or Beans, at 28 bushels, average 3*s.* 3*d.*	4	11	0	56	17	6
12½ acres Clover, half mown, half fed ...	3	0	0	37	10	0
Turnip and green crop, at saleable value, to feed on farm, at 3*l.* per acre				60	0	0
Straw consumed on farm by way of fodder from 75 acres, and keep of stock thereon, and feed on eddishes				30	0	0
				£530	17	6
Loss on 100 acres				100	7	3
				£631	4	9

Now from this it appears that at 5*s.* per bushel for Wheat and the other low prices named, the tenant obtains about 25*l.* by the employment of 1000*l.* on 100 acres of land—with which to keep his stock and implements good and repay his own superintendence, cost, and labour: this is plainly quite insufficient for the first only of these requirements. But we venture to assert with confidence that land worth nearly 2*l.* per acre, as this is supposed to be, might with an intelligent economy of management be made to yield more than 30 bushels of Wheat, 40 of Barley, and 48 of Oats—that Turnip and green crops may be made worth more than 3*l.* per acre, and that Clover half-mown, half-fed, is

* By OWEN OWEN ROBERTS, London: SIMPKIN and MARSHALL.

worth far more than this sum on land of "average quality." We venture confidently to assert that two pairs of horses are able to manage more than 25 acres of green crop—that many of the items under the head of tradesmen's bills are too high—and that the quantity of seed used is unnecessarily great. And do not let it be supposed that our argument is directed only towards the tenant's side of the question—for the sum charged as Rent, in *all* its items, even though it should not be too high already, will, we have no doubt, fall, with all the other particulars of cost, to a level permitting the attainment of the usual farm profits per annum. The subject of agricultural economy even in this general view of it, furnishes reason for confident hopefulness as regards the position of agriculturists: and, if it be taken in union with the certainty of reduced rents which must follow reduced prices and might *accompany* them, if occupiers would only insist upon their rights, we do not think that that which gives satisfaction to one-half of the community ought to frighten the other.

Nothing is so various as farm practice: the truest skill will modify the details in every branch of the business, so as to attain the most economical result according as different conditions present themselves. In comparing the features of particular systems of agriculture, whether in regard to different districts or countries, we are often apt to arrive at very erroneous conclusions by overlooking the requirements of some localities in which others do not participate. We have often thought that writers have erred much on this head: and, having seen a little of both Scotch and English systems of farming, we have endeavoured to sketch the leading peculiarities of each: it has been our desire to do so with impartiality, and, in a friendly spirit, to evoke discussion on matters in farm practice wherever it should appear that different means were taken to accomplish similar results.

As formerly stated, we regard the merits of the Scotch system of farming to consist chiefly in Economy: in other respects we believe it to have been entirely over-rated. We may have overlooked other merits possessed by it, but we must confess that they are unknown to us. We have had no intention of holding up the Scotch farmers as the "best," or "as a pattern to all England" in any details of farm management, without stating specific grounds for such an opinion: and to illustrate the economy of farm management, we thought the most likely means of arriving at a correct estimate was to view the results in the gross. If the expenses of a single acre of any crop had been taken, it would have been as liable to discussion as the estimates of the whole crops on the farm: the correspondents of the *Gazette* do not seem able to arrive at the expense of raising an acre of roots within pounds of each other—a goodly sum when applied over a large breadth. If we had a good chronometer we might soon detect the aberrations of a badly regulated watch, and we could easily ascertain the effects of a small error when it had been frequently repeated. In farm practice we have no such correct standard of comparison—the expenses of cultivation are as various as the physical nature of the soil—and, besides, if you pressed a Scotch farmer too closely on this head, you would perhaps find that his practice is much in advance of his calculations, for you will be told "if you count cost you need not sow corn." We prefer the synthetic method; and to argue the merits of details entirely on principles.

In endeavouring to show the economy of the Scotch system in horse-power—an item of expenditure which a modern writer (Colman) views as "the great drawback in England to a farmer's prosperity"—we thought that we could not apply to better authority than the careful and compendious work on "the Agriculture of Suffolk," by Messrs. Raynbird; and we feel that an explanation is due to them, of the manner in which we have attempted to draw conclusions from their details of a Suffolk farm, when contrasted with the same in Scotland. We entirely agree with Mr. Raynbird that there is much in the two systems of farming that might render comparison in this respect unfair: but a light land farm was selected in both cases, where the same proportion of white and green crops were grown, and where the physical characters were similar. It would have been unjust to have taken the amount of horse-power required on the heavy lands of Suffolk, for we think that there is a wide difference in physical qualities between the fertile clays of Earl Soham and the heavy lands of the Scotch carses. The management of the white crops on the heavy lands of Suffolk is particularly excellent and neat; the narrow "stetches" which the drill covers at once or twice—the horses walking in the furrows—enable the tenacious clays to be cultivated in fine style. But we believe that the practice is too uniform, and that the farmers err grievously in cultivating the light lands in the same manner; this practice must involve a loss of land, as nothing grows in the furrows; and a greater amount of extra horse-power will thus be required on the farm than in broad work, even though in the latter case the whole of the green crops and hay should be carted into the farm-yard.

On the arable lands in Scotland there is no permanent Grass land cut for hay, and we were aware that "some expenditure of horse labour" was required on it, and to balance this we kept down the usual extent which 10 horses would accomplish in Scotland, by at least 20 acres, which was imagined enough to compensate this difference. We did not give extreme instances, as we know that on some farms a much larger extent was wrought, even where drilling was generally adopted; and on the other hand, we know of some light lands in Suffolk where the number of horses kept was as great as that stated by Mr. Raynbird, even where claying is not practised. We are asked whether the growth of Mangold Wurzel and Carrots does not require some additional horse-power, "to drive them to the yards." No doubt they do. The average produce of these roots, on such a farm, is calculated at 260 tons. Now, 10 horses should drive all these into the yards in four days at the most, which is scarcely equal to one-seventh horse-power throughout the year; and it must be borne in mind that probably three or four times the same quantity of roots are driven in by 10 horses on a light land Scotch farm. Many of these items of expenditure of horse-power appear formidable to an English farmer, which a Scotchman, with more simple means, would think little about.

In regard to drilling corn crops, we think that Scotch farmers should not be deterred from following this practice, on the ground that it may occasion them to employ an extra horse or two; for, if the land were kept clean while in corn, less labour would be required to prepare the stubbles for the green crops, and autumn cultivation might in many cases be adopted. The extra seed sown in Scotland might be well applied in wages to hoe the crop, if drilling was practised. We believe that, as agriculture advances, less horse-power will be employed, and more manual labour. It may be stated with certainty that the Scotch farmer could not furnish favourable contrast to the English farmer in economy of horse-power, if he were compelled to use the waggon and the tumbril, and to have small inclosures and stetches of a few feet in width on the light lands; for we imagine these would swallow up the greater part of that surplus horse-power required on many an English farm.

There is generally a most simple and efficient class of farm implements in Scotland. The great display at Norwich did not afford a very favourable contrast; no doubt many reflected great credit on the progress of agricultural engineering, but a vast proportion were rude and expensive tools for the end they were intended to serve. We never see a railway locomotive but we can stand and gaze with admiration on its beautiful and complicated mechanism, when we reflect on the wonders which it has accomplished; but we can never look with much relish on an agricultural implement which bears an unnatural resemblance to it, after having seen its best efforts. Steam on a farm should certainly be a fixture. Agricultural engineers should aim at substantial simplicity rather than ingenious, but expensive refinement; they should always remember that the spade, and even the flail, are two very efficient implements when wielded by a vigorous arm. *R.*

COST OF FATTENING PIGS.

I now send some of my accounts of the cost of fattening pigs, having just slaughtered the first lot of my own breeding. When I began farming I was dissuaded from my design to breed my own pigs, on the ground that the sties were so contaminated with young animals that they could not thrive. I accordingly began with purchasing rather large store pigs, but found them unprofitable, for two reasons. First, in purchasing, the dealer always said store pigs were very dear just then, and when they came home I learnt that I had bought them too dear. Next, they were never in the condition that pigs of their age ought to be; for I am convinced that one art of profitable feeding is to push the animals forward from the very first. Accordingly I afterwards purchased younger animals, which left a smaller margin for the dealer to get the advantage of my man, who in other respects was, I believe, a good judge; and gave me the chance of causing them to make earlier progress. I have given the cost of the first lot in full detail, that my system may be better understood, and because it is rare that one can get a lot of pigs, every one of which it will be worth while to carry through a process of fattening up to large hogs. From this it will be seen how many journeys there are to mill—a serious affair probably to some farmers, but to me, who am compelled to keep three horses to 35 arable acres, comparatively trifling. I have not included it in the cost, neither the litter, nor the attendance—matters well worthy of notice in a comparison with purchased manures, but of no consequence in my method of estimating the future profits of my farm, by debiting it at once with the whole horse and manual labour. I must have made a mistake somewhere when I formerly stated that 11*s.* a score (20 lbs.) would pay 27*s.* a quarter for Barley, for these accounts show that it will pay more. Lot 4 I am much pleased with, as I picked out the sow myself from lot 3. Farmers may say what they please, but it is clear to me that a good selection, good attention, and good food (not Potatoes, Turnips, and other such rubbish) will make a pig pay pretty well the market price of the Barley, except in very dear seasons, and leave the manure for the cost of litter, attendance, interest of money and buildings. The propensity of a pig to fatten, compared with a sheep or an ox, is truly extraordinary, and then you get a good price for the non-nitrogenous article fat, leaving, I presume, a highly ammoniacal manure. I could, in a sense, wish it were not so, for I am a vegetarian in diet, and detest this fattening system; but unless artificial manures, and the sewage of towns, become much cheaper, or Tull's system can be made to answer, I see no other method of profitable farming. I would call attention to a notable difference in these accounts, namely, the variation in the quantity of Barley from one to three quarters per hog. I had some Barley by me in the spring which I used in place of toppings for the last lot, and I kept them on longer on Barley-meal at last, and got them up to a greater weight than the previous lots. I killed the first pig in the last lot five days before it was nine months old, and it weighed 12 score 2 lbs., and the last killed weighed 15 score 6 lbs. being ten months and nine days old. The reader must judge what rubbles and toppings are by the price. A sack of bran would cost 4*s.* and a sack of pollard 4*s.* 6*d.* here, at the time a sack of rubbles would cost 7*s.* 6*d.* They are all the offal of Wheat, ground.

1847.	LOT I.	£	s.	d.
Jan. 23.	Bought 8 pigs, just 8 weeks old	4	0	0
	1 qr. of Peas bought	2	16	0
	1 qr. 6 bushels of Beans bought	3	13	6
— 16.	1 sack hog flour	1	0	0
	1 ditto rubbles	0	7	6
Feb. 20.	1 ditto ditto	0	7	6
Mar. 5.	1 ditto toppings	0	15	0
	2 ditto rubbles	0	15	0
April 8.	2 bushels toppings	0	10	0
	1 sack rubbles	0	7	6
— 16.	2 sacks rubbles	0	15	0
May 5.	1 sack toppings	0	15	0
— 8.	1 sack rubbles	0	7	6
	½ ditto Pollards	0	2	9
— 26.	1 sack toppings	0	16	6
	3 sacks rubbles	1	4	0
June 21.	3 ditto ditto	1	4	6
— 22.	1 ditto toppings	0	16	6
July 8.	1 ditto hog flour	0	19	0
	3 ditto rubbles	1	4	0
Aug. 2.	1 ditto toppings	0	16	6
	3 ditto rubbles	1	4	0
	Grinding 12 qrs. 1 bush. of Barley	1	12	4
	Cost, exclusive of the Barley	26	9	7
	The pigs began Barley-meal on Aug. 21, and were all killed by Oct. 20, weighed 84 score 2 lbs., and fetched 11*s.* per score	46	4	0
	Deduct expenditure, as above	26	9	7
	Leaving, to pay for 12 qrs. 1 bush. of Barley (which was quite worth that money about that time)	£19	14	5

1847.	LOT II.	£	s.	d.
Oct. 1.	Bought 12 pigs, 15 weeks old, but stunted	9	12	0
	2 sacks of Beans bought	4	4	0
	8 sacks of rubbles	2	16	0
	10 sacks of toppings	6	14	6
	6 sacks of Barley-meal bought	5	14	6
	Grinding 12 qrs. of Barley	1	12	0
	Cost, exclusive of the Barley	30	13	0
	Four pigs were killed as porkers, and, at 4*s.* per stone, were worth	5	4	0
	The other eight weighed, when killed, 80 score 17 lbs., and fetched 10*s.* 6*d.* per score, or	42	8	6
	Total income	47	12	6
	Deduct expenditure, as above	30	13	0
	Leaving, to pay for 12 qrs. of Barley, the same sample as before, but not worth so much money as then	£16	19	6

1848.	LOT III.	£	s.	d.
April 1.	Bought four pigs, in good order	2	16	0
	5 bushels of Peas bought	1	2	6
	9½ sacks of rubbles	3	6	9
	5 sacks of toppings	2	16	6
	1½ sack of hog flour	1	12	0
	Grinding 8 qrs. of Barley	1	1	4
	Cost, exclusive of the Barley	12	15	1
	One pig fed out of the above, but having no part of the Barley-meal, was kept as a sow, and valued at the time the rest began Barley-meal, at	3	10	0
	The remaining three, when killed, weighed 39 score 2 lbs., and fetched	19	10	0
	Total income	23	0	0
	Deduct expenditure, as above	12	15	1
	Leaving, to pay for 8 qrs. of Barley, of the bad quality of the harvest of 1848	£10	4	11

LOT IV.

The sow mentioned in Lot III. had 11 pigs on the 7th March, 1849. One of these was killed when weighing 12 lbs. The other 10 were kept for bacon hogs, the last of which was killed on January 16th inst. The sow has had a second litter of four pigs, now about three months old, and the following account will include the cost of keeping the sow from March 7, 1849, up to the time of having these four pigs, as well as the cost of the 10 fat hogs:

2½ qrs. of Peas or Beans, grown by self ...	...£3	15 0
17 sacks of rubbles, at 6s. per sack ...	... 5	2 0
3½ sacks of toppings, at 12s. per sack ...	... 2	2 0
Grinding 30 qrs. 3 bush. of Barley	... 4	1 0
Cost, exclusive of the Barley ...	...£15	0 0
The 10 pigs, when killed, weighed 134 score 8 lbs., and fetched 8s. 6d. per score, or	... 57	2 0
Deduct expenditure, as above ...	... 15	0 0
Leaving, to pay for 30 qrs. 3 bush. of Barley (which would not have fetched more than 26s. per quarter in the market)	...£42	2 0

I am as astonished as the reader may be. I had almost forgotten, as items of food, buttermilk from two cows, occasionally some skim milk, a little cut Grass or Vetches, and stubbling, the value of which the reader can guess as well as I can; but the last lot has had a great deal more skim milk than the others, which must have contributed materially to this otherwise almost incredible account. I have examined it over and over again, and cannot find any error. *Amicus Tull.*

AGRICULTURAL USES OF STEAM POWER.

It is worth while, however, to ask, what is the specific impediment that forbids the banns between the Steam-engine and the Plough-share? What it is that prevents the versatility—(that peculiarly marked attribute of steam power)—which can drive a vessel of several thousand tons across the Atlantic, against a head-wind and sea, or spin the finest thread with a touch more delicate than the human thumb and finger—what prevents it from being applied to the clumsy performance of the Plough?

Because it is a clumsy performance: and that noble power will have nothing to do with it. It is a law to which the annals of invention have given repeated proof, that late-discovered powers of Nature will not "gear on" to those means and appliances which they have antiquated. They refuse to *waste themselves.* From the natural sympathy—so to speak—which exists between the "best of its kind" in every department of matter, may be deduced the perception of a corresponding law of antipathy between things separate and incongruous in their nature and degrees of excellence, and remote in the order of invention. It is not the inapplicability of steam power, but the incongruity with it of the Plough (an instrument employed for the purpose of applying *animal traction* to the act of cultivation, and belonging only to that secondary class of powers) that forbids the union.

The plough does not *cultivate.* It must be followed by the harrow, the scuffler, the roller, the scarifier, to complete, by many and repeated processes, the work which, after all, is not so well done as it is accomplished in one good digging by—THE SPADE. Is there nothing in this to furnish a suggestion as to *the mode* in which steam-power must be applied, if ever, to the problem of *cultivation?* We estimate the expense of a summer's fallow, on stiff land (five ploughings, with harrowing, &c., to correspond, and loss by Rent), at 5*l.* per acre. It could be well dug, for less money, at one operation. Why is it not? Because our horses and implements would be lying idle, which are rendered necessary by the whole economy of the farm-arrangements as at present constituted, and which prevent the possibility of adapting *handwork* on the scale required to get the fields ready at the proper periods; and, also, because cultivation by *hand* requires a peculiar co-operation of *the will* (well understood by employers of spade-labour), demanding either an inward impulse, which nothing but *direct* self-interest can give, or a lynx-eyed superintendence, the expense of which destroys the balance of profit from spade-cultivation over the clumsy honesty of such animal power as we have long substituted for it. Set a man to dig 2 acres of land, one for your Wheat-crop, and the other for his own, and you will see quickly the operation—almost unconscious to the labourer himself—of that law which limits spade-work to his *own plot,* and denies it to *your acreage.*

The plough, and all the instruments that follow it, are only the "animal-power" substitute for that more perfect process accomplished in brief by the spade, when worked by the foot, held by the hand, and directed by the skill, and *purpose,* of manual labour. This is what mechanical power must imitate: not the sluggish cleaving of the ploughshare, which only splits up an unbroken seam of surface, making a *fulcrum* of that which lies below, and thus pressing and polishing the sub-soil year after year into barren and impermeable induration, which the roots of no annual can penetrate. This is but the first of a whole series of imperfect processes, not one of which it is even desirable to imitate; not one of which is *necessary* where the spade can be used.

Why then should we wish that *ploughing* should ever be done by steam-power, stationary or locomotive? What we want is not ploughing, but *cultivation:* that process which the farmer by necessity performs in three, four, or five acts, not half so well as the gardener accomplishes it in one. As well might we expect to apply successfully the boiler and cylinder of a locomotive to the pole of a four-horse coach, or the shafts of a wagon, or the lever handle of a common pump, or the distaff and spindle of a cottage spinning-wheel, as attempt to gear on the power of steam to the elaborate clumsiness of a plough. In every case where steam has superseded animal labour (as it is its mission to do), it has demanded to be harnessed to the work with a harness of *its own;* it has rejected old-fashioned tools and their appliances, and has seized at once the shortest means to its object. Instead of the leverage of the horse's leg, pulling at the axletree, it seizes at once upon *the wheel,* and drives it round; and instantly (by that law of occult affinities above alluded to) a demand is raised for *the most perfect surface,* for the wheel-tire to run on: the iron rail is supplied, and Mr. M'Adam, though a very good dog in his day, is discarded. So, again, instead of working at the pump-handle, it seizes at once upon the sucker-rod and drives it up and down. Instead of wasting time and labour in the back-and-forward action of *the oar,* it drives along the vessel by the continuous stroke of the paddle-wheel, or, still more simply, by the screw. But of all its triumphs, the greatest and the most astounding was when the puzzling problem of *the Spinning-wheel* presented itself! Here was the foot, the thumb and finger, the directing will—all at work at once, and all to be imitated and superseded: the very moisture of the skin requisite to the rolling and hardening of the twist, as it was pressed between the fingers! What an operation to attempt by the dead rollers of machinery. Under the full glare of such a precedent, what upon the same earth, it may be surely asked, declares that the act of inverting and crushing a clod of soil should present an insurmountable or an unprofitable task to steam-driven machinery? I say "inverting and crushing," for in those two acts lies the problem of cultivation. In a dry climate it is simpler than under our moist atmosphere, for we are obliged to chop the soil instead of crushing it. If we analyse the act of cultivation as performed by the spade, it is as follows:—The blade is pressed to the requisite depth into the soil, the handle is then bent down, as a lever, to lift the slice, which is turned over, and dropped into the trench, top downwards; the under surface, thus exposed, is then chopped and cut, in order to admit the atmosphere, which in fact is the real fertiliser after all,—and to expose the soil to which, as fully as possible, is the whole object of cultivation. It is hardly necessary to point out how imperfectly this is done by the plough. Instead of inverting, it turns the soil only half or three-quarters over: it goes through it like a wedge, *squeezing* it from its bed, instead of raising and loosening it. It is true it breaks the soil if light, but it is the heavy soils that most need breaking; and in proportion as the furrow-slice is broken, it often drops back, and the inversion is less complete. It leaves the surface weeds either actually peeping at the edge of the furrow-slice, or if concealed, yet seldom sufficiently buried to be destroyed: but what is worse, it does all its work at the expense of the subsoil, which, year after year, is worn, and sometimes polished to a case-hardened surface by the repeated pressure of the share, and the stamping of the iron-shod hoofs that drag it. What can offer a more forbidding and impenetrable barrier to the descending roots than such a pavement as this meeting the sponge-like fibres that are destined to find nourishment for the stem, and which begin to seek it at the greatest depths, just when the plant is in the latter stages of its growth, forming the grain in the ear? This evil the spade entirely avoids: it neither hardens nor loosens the subsoil, it leaves it precisely in its natural state, moderately stiff, a condition perhaps the safest for plants of the grain tribe, which require a firm footing to carry their long stem, though for the more succulent tribes of root-crops a subsoil broken to a greater depth is desirable.

The plough is certainly a better cultivator upon a light than upon a stiff soil. It is upon heavy and retentive clays that the superiority of the spade is pre-eminent. Here, therefore, is the great field for improvement: what we want upon the clays (which embrace so large a portion of Great Britain), is a mode of cultivation which may be accomplished without the treading of animals or any *traction* at all of the implements of tillage across the worked land. In pursuing, therefore, the subject of cultivation by steam, the idea of the plough is a misleader. What we want is not to plough the land, but to cultivate it: and if, as I have endeavoured to show, the plough and all its subsidiary implements are a mere substitute for the spade, and on stiff soils in a moist climate, a very expensive, cumbrous, and imperfect one, the object of the inventive machinist will be better directed, as well as simplified, by discarding it altogether from his thoughts, and concentrating his attention on the action of the spade.

The gardener scarcely permits a dog to walk over a bed that has been newly worked; yet the farmer is obliged to let his whole team of horses with all his heavy implements pass over his land many times after the cultivation is finished; and even after the sowing is done, the seed-harrows do but skim and film over the dismal work made in damp weather by the tread of the horses that draw them, and the previous implements. On heavy land, in a moist season, this is most pernicious: in fact, it limits the cultivation of such soils to seven months out of the twelve. Now all attempts at cultivation by steam seem to have failed, chiefly for this reason, that the experimentalist has set out with the idea of an instrument that is to be drawn backwards and forwards across the field, like a plough, either by a locomotive or a stationary engine. No such necessity exists. The spade is not *drawn across* the field: it acts perpendicularly upon the spot it is applied to; separating, lifting, and inverting each spadeful in succession, neither damaging by any farther pressure the soil it has once moved, nor hardening the subsoil underneath, in the act of moving it.

In reference to the economy of steam-power, Sir John Herschel has well observed, that in reaching the summit of Mount Blanc, a man must toil for four or five days in succession, whilst *two pounds, avoirdupois, of coals* in a steam-engine would be able to lift him to that height in a few minutes: in the same manner it has been calculated, that one ton of coals have virtue in them to perform the horse-power required to plough a hundred acres of land, could we but discover the proper *mode of applying* steam to cultivation. To plough a hundred acres of land by horse-power costs about 40*l.* We can form a kind of judgment therefore—*in advance of its realisation*—of the comparative cost of the production of food by animal power and by steam power. In the days of Alfred, when the purchase of a book made a serious gap in the income of a prince, the price of a volume of the "Penny Cyclopædia" would have afforded matter of more just incredulity than can prudently be entertained in the present day of the possible application of that power to the production of food which has already been applied to that of clothing. The mechanical production of articles of physical want, is a department of human labour, in which all experience warrants us in anticipating the greatest economical improvements; and true philanthropy can hardly devote itself more wisely than to the furtherance of such inventions, as well as the suppression of that distrust of their accomplishment which often delays the progress its incredulity discourages. *Mr. Hoskyns's Inquiry into the History of Agriculture.*

Home Correspondence.

Spouting to Eaves.—Many of us are unable to get our landlords to put up eaves-spouting to the buildings round our farm-yards, and the consequence is that, although we have taken the economical step to construct tanks to receive the liquid manure draining from our yards, we find in rainy times the contents of the tank so weak and "small-beerish," that it is not worth the labour to pump up and carry to the fields. Much the greater quantity therefore at such times runs to waste after the tanks are filled. Will you or any of your readers be so kind as to inform me what would be the best mode of extracting from the large bulk of liquid entering the tank in wet seasons the small proportion of fertilising matter which it contains, so that it can be retained in a more concentrated form for use at a time when it will be more serviceable. Would not gypsum thrown at intervals into the tanks fix the ammonia, and when emptied from them become a most valuable manure? Would common lime answer the purpose? A little information on this head will enlighten *An Ignoramus.* [Pump to waste from a well connected with the tank through a large bulk of charred stuff, and by and bye clean out the filter and use *it* as manure.]

High Farming.—In the article on this subject in a late *Gazette,* the writer observes, "A time is fast approaching, when the plough must give way to a better and more effectual instrument; if not the spade, it must be nearly assimilating in its effects." The spade has been proved so superior to the plough, that many of our farmers begin to think of returning to that primitive method. This will never do, onward is the watchword. Why should we not have a spade engine? My idea of such a machine is, that it should be a revolving box, containing teeth; on the outside of the box, on one side, three rows of spades, opposite the same number of forks, six in each row, thus the machine would contain 18 spades and as many forks. The spades to raise the sods and conduct them into the box, as the box revolves the spades would rise and the forks descend and loosen the subsoil, as the forks left the subsoil the earth to fall from the box, and spread again on the land thoroughly pulverised by its revolutions in the well toothed box. The engine to be worked by steam power, and moved by a couple of horses. Machinery for agriculture is far in the wake of every other thing in England. There are many works on the steam engine, in regard to its application to mines, mills, steam navigation, and railways. But no aid for the farmer. Let us consider a ship for a moment, not one that is to bring us gold and spices, but one sent by some enterprising merchant, to fetch corn; does he send a number of small heavy vessels similar to those owned by our forefathers, when the spade was invented? No, he will apply a large sum of money for a good ship with proper charts, compass, and an intelligent captain. Suppose now the same degree of intelligence and expensive machinery was used in raising the corn at home, or suppose again that our ships were as rudely constructed and manned as our farms. Landlord and farmer must work together, there is much for both to do. Union and a ready consent to whatever may promise to their mutual good is the only plan. And if we want an example to the contrary, we have only to look to Ireland, and there is not one, however ignorant he may be of his own failings, but sees much to condemn both in the people and the landlords, and shall we suffer ourselves to sink into the same slough? *Anon.*

High Farming.—In the present day, when so much is said and written on the subject of "high farming," it becomes the duty of all who write and read to analyse well the calculations put forth. Otherwise, a subject so laudable in itself, must lead to a perpetuation of error and misunderstanding. I am a great advocate for high farming, in a qualified sense of the term, but when your correspondent "Verax," in your excellent Paper of the 19th ult., asserts that land may be dug 10 inches deep at 4*d.* per rod, which is little more than 30*s.* per acre, I must beg to correct him. He will find that 160 × 4*d.* = 2*l.* 13*s.* 4*d.*, which will also

throw his preceding calculation into shade, viz., that it (digging) may be done "at a cost very nearly assimilating to horse power." The above error just gives practical farmers room to doubt whether the result of the crop is correct, viz., 69 bushels from 2 pecks of seed upon such land as he describes. The remainder of "Verax's" contribution I consider to be chiefly theoretical quackery; by which practical farmers are every day insulted by statements of cost and produce. "Verax" says, in speaking of the capabilities of land under good management—"I fancy its limits have not yet been attained." We do not want fancies to be sent forth by an *Agricultural Gazette*, or otherwise I should fancy "Verax's" statement to be the production of any one but a practical farmer, especially when he adds, in conclusion, "dig 10 inches deep, and below work the subsoil over by a fork, and I have no hesitation in saying that the cost per acre will be less than by horse power." *A Suffolk Farmer.*

Rents.—I have been much surprised that, at the many large meetings which have been held in various towns and counties of late, no resolution has ever been moved and carried by either landlord or tenants, to the effect, "that it is expedient that there should be a reduction in the rental of farms." Everyone who has had any transactions in land, whether as owner or occupier, is fully aware that in the last few years the rent of land has steadily advanced; land under-rented is quite the exception to the present rule—in short, the landlords must be aware that they have the full share of the improvements in farming by the advances made in rent, whether those improvements were made by themselves, as owners, or by the tenants. If, then, our present rents were considered a just and fair value of the land, when corn was 50*s.* for Wheat, and other corn in proportion, how can it be so now, when the average of Wheat has fallen? which was the case for the six weeks ending December 22, 1849, to 10*s.* 6*d.* below that price, making a difference in value, of Wheat alone, to a farmer who produces 4 quarters per acre, of 42*s.* per acre, with a loss on a similar scale on all the remaining produce of his farm. That the present rent of many farms, where the tenant has no capital beyond what he has invested in his occupations, will never be paid long is as certain as that no man can pay 20*s.* who can only earn 16*s.*; and is it fair towards those who have other resources to make them do it? most certainly it is not. Every landlord must know that he is now procuring as many of the necessaries of life for 20*s.* as he formerly did for 25*s.*, and although he may justly say that in many articles he is indebted to a relaxation of the duties on foreign produce, such as sugar, brandy, &c., still the main articles of consumption and wear are the produce of his own tenants, say, bread, beer, meat, clothes, and shoes. These are all made from raw material produced on his own property, by his own tenants, which tenant he now continues to charge the same rent as he did when the tenant had the chance of charging him an extra price for the above mentioned produce. A landlord may say he only charges the market value of his land, and up to the present time perhaps that argument holds good, but a different feeling is now prevalent amongst men, and although many highly farmed occupations might be taken at the present rent, with a view to benefit by the late tenant's improvements for a few years, by men of small capital, it is quite certain that really good and monied tenants will not be found to embark in highly rented losing concerns. Surely, then, it is but fair, and expedient also, to keep the present tenants, by allowing them out of their rents such a portion of the saving as a landlord effects out of his income that can be fairly apportioned to their articles of produce. Many, I know, both write and say it is not a question of rent; and one party writing went far enough to say he had been insulted by a return of 10 per cent. No one supposes that 10 or 20 per cent. alone is equivalent to the loss, but as well might a man say to a builder, "Take away those stones, they will not of themselves build my house." True, but they will lay the foundation; and until we get higher prices by some means or other, we must be content to take as many small contributions as can be collected from one quarter or other, and I think it will puzzle any tenant to find a better item for the foundation of such saving than 15 per cent. off his rent; no retrenchment in the expenses of Government will ever come so home to his purse as that, although it is a very desirable object to be gained, in combination with other savings. In fact, reduction of rent is now our main stay until we get higher prices for our produce, and, added to some such savings as the following, will enable many tenants to hold on "till the good time comes." Take first, then, 15 per cent., or more, where the case is a bad one, off a rental of 400*l.* per annum, equal to 60*l.* per annum; add to that the reductions in the price of labour, in oil-cakes for feeding, in horse corn, ditto for sheep, seed corn, besides the reduction in all articles of household expenses; add these together, get some of our local and government taxes reduced, and it very much improves the picture, and I am sure that instead of a reduction of rent being an insult, it will be the chief and most certain means of enabling us to hold our occupations. When, then, we hear at these public meetings our landlords use that oft-repeated quotation, "We all row in the same boat," then let them be requested to take an oar for once, and endeavour with ourselves to bear up against the storm. The demand must be firmly advocated; it is the greatest and only real help we can get for the present, and one which has justice strongly on its side, which is one of the most powerful advocates a cause can have. *E. C.*

Memoranda.—It is suggested by a constant reader of this *Gazette* whether there is not a fallacy in a late remark published by us, that on a reduction of the price of Wheat one-third, one-third more Wheat must be sold to raise the present amount. Suppose the quarter of Wheat 60*s.* reduced to 40*s.*, that is 20*s.* a sack, surely half the quantity, one sack, and not one-third, must be sold to raise the sum of 60*s.*; 40+20 = 60.—As to the uses of carts and waggons, no doubt carts are most desirable where the article such as chalk or compost is to be unloaded; but nothing gives a lad more trouble than to load a cart with hay or corn, the area is so small, and more accidents happen, not only by the frequent falling of the load in the field, but to the person employed in loading coming to the ground with or without the contents of the cart; then the difficulty of fixing a cart if you wish to take the horse away before unloading, and the nice balance required in pitching off the hay or corn, makes the waggon greatly preferable both for convenience and safety.—An inquiry was made in a late Number on the subject of sheep feeding in an orchard, and whether they injured the Apple trees. Not when they are old and rough in the bark, but the rubbing of sheep against young trees will hurt them by the grease of the wool apparently stopping up the pores of the wood. Sheep must be hard put to to eat the Grass under the shade of an old orchard, it is generally so coarse and sour.—There has been much complaint of the bad accommodation for the poor labourers in the country, but undoubtedly the heavy tax on bricks, very nearly one-fourth, 7*s.* on 28*s.* the thousand, is the reason why more, and more roomy, cottages are not built. The writer has a small cottage with only one bed room, where the family has gradually increased to the number of eight, man and wife and six children; and though he professes to be as poor as one of his own barn rats, he feels obliged this summer to add two rooms at an expense of 30*l.* to 40*l.*, and if he gets his rent for the next eight or ten years he will not have cleared himself of this outlay, so heavy by reason of this very exceptionable tax on bricks.—Mr. Hine, in his remarks in the last Number on Saintfoin, is quite right about the wireworm, &c., and he might have added that no produce of the farm is so nutritive, either as hay or Grass; it is also invaluable to stop the scour in sheep or lambs; but when Mr. Hine writes of Saintfoin being cut in June for hay, and again for seed in August in the same year, he must have been altogether in the clouds. It is the case with broad Clover, but under no circumstances whatever with Saintfoin, confidently affirms their humble servant, who has cultivated it for years. *J. D.*

Draining Peculiarities.—It is as well, when we observe certain effects, to endeavour to trace their causes. We had a heavy fall of snow last Friday, on Saturday night it thawed; the next morning the 1-inch drains, 5 feet deep, on the Clover leas and Rye-grass fields were discharging like pumps; the Wheat fields, the fallows for roots, and the Tare field scarcely showed a discharge. How is this to be accounted for? The soil and drainage were alike. Again, in the autumn, the Turnip and Mangold Wurzel fields discharged most abundantly, whilst the drains in the Clover leas, fallows, and stubbles did not run at all. Is it because the shading of the leaves prevents evaporation, and condenses large quantities of dew? It cannot be owing to deep and loose cultivation, because the bare fallows did not discharge. Again, in May I have observed the Wheat and other fields discharging most abundantly, whilst not a drop flowed from a heavy crop of Tares. Do Tares evaporate prodigiously, whilst Turnips attract, condense, and deposit moisture? Farmers all like Tares on heavy land—they dry and loosen the soil; Turnips, on the contrary, keep it moist. No doubt season has something to do with it. By the bye, it is a good sign that at last, in the 19th century, the *Times* agricultural commissioners have just discovered that our national agriculture is woefully deficient. There are hopes for the future now. I hope there is no one now who doubts about deep drainage answering in strong clays. *J. J. Mechi, Tiptree-hall, Jan.* 25.

Italian Rye-grass.—In 1848 I sowed an acre of Italian Rye-grass, in spring; I cut it in the autumn twice. In 1849 I cut it seven times—that is, five heavy mowings, and two inferior in October and November. It is now rather bare in parts. I wish to know whether I can cut it again this year productively, or whether I had better have it dug and grow Carrots? How can I get rid of the narrow-leaved Dock out of a meadow I am now entering upon? With two acres I have kept two cows, and sometimes three, in full profit for the whole year. By deep spade husbandry, and subsoiling with a fork 14 inches long in the tines, I grow Italian Rye-grass, Vetches, and Rye, Rape, Mangold Wurzel, Carrots, and Kohl Rabi, following Blacker's invaluable system. I buy hay and Oat straw; the latter we steam in one of Richmond's useful machines. I dig 2 feet deep, and fork below. The remarks which "Verax" makes in page 43 are generally true, as I can practically assert; but he is incorrect as far as respects the north, in saying "you may in most neighbourhoods get land dug, say 10 inches deep, at 4*d.* per rod, that will be little more than 30*s.* per acre." In Lancashire you cannot get it done at that price; besides, 4*d.* per rod comes, according to my calculation, not to 30*s.*, but to 2*l.* 13*s.* 4*d.*, a material difference. As I am alluding to subsoiling by the large fork—if "T. G.," of Clitheroe, applies to Whittaker, the blacksmith in Accrington, he will make him a first-rate fork, such as has done good service to your obedient servant, *R. W.* P.S. We use the large fork in summer between the rows of Mangold Wurzel, lifting the soil 14 inches deep, and find it very successful. [A good workman will earn 2*s.* 6*d.* per day at digging 10 inches deep, what may be called an adhesive loam, for 4*d.* per rod. You had better dig the Rye-grass stubble for Carrots. Docks must be pulled up.]

The able Pamphlet of Mr. Huxtable is justly exciting attention amongst agriculturists at the present moment. I must, however, confess I am not so hopeful as the author of the feasibility of growing Wheat at 5*s.* per bushel, and meat at 5*d.* per lb. Few farmers of intelligence will fail to admit that his views on the general principles of farm management are sound and good, and that if such principles, skilfully put in practice, will not realise a profit, we may despair of success under any other. His estimate of the cost of the manual labour to carry out the course of management he recommends is so very far below the amount which experience has taught us to be necessary under a much lower system of culture, that I fear the effect of his essay, without further explanation, will be to depress and dishearten, rather than rouse and encourage the large class of farmers who cling still to the customs of their forefathers, and who are really the class most in need of aid. If Mr. Huxtable can adduce one instance in which the course of husbandry he recommends has been pursued at the small cost in labour he assumes to be practicable, and where the land has remained free from Couch at the end of the course, as he assumes it would be at the commencement, and would kindly furnish the public with the items of expense in manual labour during the course, he would confer an obligation on the agriculturist. I have adopted a somewhat similar course to that recommended by Mr. Huxtable, but have found my labour bill to exceed double the amount stated by him, and in regard to the item of 1½*d.* per bushel for threshing Wheat, I cannot get the work done under 4*d.* per bushel. *R. F. W.* [The cost to us, including coals, per centage on machinery, and labour, is less than 2*d.* per bushel.]

Railway and Farm Hedgerows.—Travelling the other day to and from Birmingham, I observed men carefully digging the earth close to the roots and stems of the thorns forming the railway fence. A good many reflections at once presented themselves to my mind. Why was this being done? Because it was profitable to do it; cultivation and the absence of weeds naturally promoted the vigour and strength of the fence. Well, then, if it was profitable to do this, why don't farmers adopt the same plan? They are supposed to be keen calculators, and yet not a single instance of the kind did I see in the thousands of hedgerows diverging at right angles from the railway fence. Was it prejudice? want of capital? want of inclination? or want of observation? or what could this neglect arise from? I do consider the Birmingham railway fences to be a lengthened and running commentary and censure upon the defective hedgerow-ism of the United Kingdom. Landlords and tenants, too, may be forgiven for having had bequeathed to them a mass of ancestral deformities miscalled hedges; but surely something might be done to diminish sheer enormities to keep them clean and trimmed into decent shape. Hedges will pay for cleanliness and cultivation, as well as Beans or Turnips, and they need it as much. I hope no British farmer will for the future be found growing his own fire-wood, or saving pollards for gate posts, or preferring wooden hurdles to iron or netting. When we have more capital in agriculture and fewer waggons, all our gates and posts will I expect be of iron. Even the surveyor's sign posts and the name plates on our carts would be infinitely cheaper in the long run if made of cast iron. But to return to our hedgerows. How often do I see a new bank planted with Thorn-fence, unhoed for years; consequently the fence itself can scarcely maintain its mere stunted existence, whilst overgrown and almost stifled by enormous Thistles and other weeds, producing luxuriant crops of seeds to stock the adjoining fields. I find practically that by cutting down to reasonable proportions an old fence, and brushing it annually just about the 1st of July (after the partridges have hatched), you get your bank covered with good Grass instead of miserable weeds. The top should be like the thin edge of a wedge. The railway fence is effective, although only 18 inches wide; the field hedgerows are non-effective, although frequently 18 feet wide. How can any useful vegetation take place under a shade 10 to 20 feet high? I have now vented my spleen about the waste of land and money occasioned by bad hedgerows. *J. J. Mechi, Tiptree-hall, Jan.* 25.

Scotch Carts.—To your correspondents "A. B. C." and "L. V. R.," I shall reply as briefly as possible in respect to these carts. I thank the latter for saying "your readers are indebted to me for many a pleasant paragraph." I hope this will be of a similar mould. First, I never gave any measurements or weight of the above carts, but I may say 7 cwt. is about their weight. They were much knocked about by my men, and are now as strong as ever, showing they are not of a "gingerbread" construction. The cost for these was 12*l.* each, made to tilt, as I conceive all farm carts ought to be. If made fixed or "dormant bodied," the cost, as all know, would have been less—most of the Cumberland carts are thus made. If Cumberland claims parentage to these carts, Berwickshire and Roxburghshire have done what the duty of the offspring should be, viz., to surpass in excellence their parents. "A. B. C." says "the Cumberland carts might be im-

proved under skilful hands." So "L. V. R." has not a perfect cart to recommend, but "X. Y. Z." certainly has, and W. Mather, of Kalemouth, Kelso, is the maker, and never were finer carts or better wheels ever manufactured. "L. V. R." speaks of the "famous border carts"—mine are amongst these, but how different is the construction of carts in every village in England, every wheelright fancies he can build a cart, and yet many of these are the greatest simpletons. I could wish many a Hampshire maker would wheel himself about and march, and let some better artificers take their place. If a plough is to be made, or any work required, a tree or half a tree must be cut up, and charged in the bill; all the wood they can, they use, then cut and trim; the cuttings and trimmings are all in the bill. What improvements can a man introduce or get done with such a class of blunderers? They also make the farm servant believe in the excellence of clumsiness. I wish in every village there was a well-educated smith and wheelright; but at present we must go far away from home for good farm implements. Some have introduced iron wheels for carts and drills, highly stupid inventions on a farm. I need not dilate upon their imperfections. I recommended Scotch carts as better than waggons, and better than any cart I ever saw in England, many of which are very "cockney," as "L. V. R." knows, and "A. B. C." can testify. In their arguments these gentlemen have, I fear, "couped," Scottice, "upset," both themselves and their carts. *X. Y. Z., Hants.*

Qualification of Land Agents.—Your correspondent "B. M.," in a late *Gazette*, jumps to his own conclusions, unwarranted by any observations of mine, as my reasoning never went to prove that a moderate scientific or classical education would alone fit a man for this duty, unless accompanied by sound practical knowledge. The absence of either renders a person incompetent to perform the services necessary, and will inevitably cause any one "to strike on a sand bank." Why should not practical agriculture form a portion of the studies alluded to? I quite agree with "B. M." that a mere literary person or "fire-side farmer" would only form a parallel to the lawyer land agent. *B.*

Cumberland Clod-crusher and Cart.—I am sorry I omitted to reply to "Clericus" on the subject of the Cumberland clod-crusher. The precise weight of a 6 feet square implement of this kind, I cannot obtain very easily; those commonly used, of the form and size described, a pair of the light Cumberland horses walk easily away with. As to the "teeth," the edges of the angles of the cross-bars or breakers may be shod with iron if desired; well-seasoned ash lasts, however, as they say here, "a serious long time"—very many years. The carpenter of "Clericus," who cannot make a tool of the kind for less than 4*l.*, ought not to make it at all; the best workman, with the best wood, would here charge no more than 30*s.* If, after the descriptions given by "A. B. C." and myself, this or any other carpenter or joiner cannot make the implement, I am afraid his head must be of a nature incapable of being influenced by any clod-crusher yet invented. With regard to the Cumberland carts, "A. B. C." may be assured that their just price is only 10*l.*, with side pieces, the whole made of the best seasoned wood, and capable of carrying a ton of lime or coal. Nay, at Penrith, a respectable cartwright declares that he charges only 9*l.*, but says "he gets his wood handier" than the mountaineers do; 10*l.* and 11*l.* also, is the price of the Scotch carts on the borders and in Northumberland (see Mr. Allen's paper read before the Newcastle Farmers' Club last year). "A. B. C.'s" cart of 15*l.*, and "X. Y. Z.'s" of 26*l.*, are neither of them the common farm cart of the North. *L. V. R.*

Advertisement Duty.—There is a notice in your Newspaper in favour of a movement for the repeal of the advertisement duty. This duty interferes more with the interests of farmers than many persons are aware of. Ever since my return from America, I have frequently complained of the evil it occasions. It is often supposed that newspapers in America are filled with politics, and most travellers regard them as mere vehicles of opinions. They are not so—they are means by which time is economised, and business extended and carried on. The news they contain is generally confined to a few lines, the rest of the papers being filled with advertisements. Whatever a farmer or shopkeeper has for sale he advertises. In England, farmers are compelled to lose, in the majority of cases, a day in order to go to a market town, and say that they have half a dozen pigs for sale, or six bushels of Vetches or Peas, or whatever else they may have. Oftentimes they fail in selling their articles, and a fortnight after, find that there was some person not far off who would have purchased of them. Could the farmer have advertised what he had for sale, he would have saved his market, and might have arranged the sale at his own house. In the town of Buffaloe, in the state of New York, there were 12 newspapers published a few years since, of which five were daily papers, and two German—but they contained hardly any news. They were sustained as advertisement sheets for the use of the farmers in the neighbourhood, and the shopkeepers in the towns, which is the case everywhere in the United States. Again, supposing such advertisements to be as frequent in this country as they are in the United States, and that farmers constantly saw notices of new machines, new implements, economical means for roofing &c., before them, their present obstinate prejudices would be overcome, and by this simple influence activity and inquiry would supplant indolence, and the dull belief that what a man has seen practised for 20 years must be incapable of improvement. *T. F.*

Farmers' Clubs.

NEWCASTLE, *Aug.*—I. "*Which is the best method of improving Grass land when it has become hidebound?*"

Mr. GLOVER announced that he had received communications on this subject from Mr. Hugh Taylor, of Cramlington, and from Mr. D. F. Jones, a Fifeshire farmer, both of which he would read. Before doing so, he would just take the liberty of saying, that it was little to the credit of a Club possessing 200 members, to send only two communications in connection with the subjects for to-day's discussion. Mr. Taylor wrote as follows:—"The idea conveyed to me by the term hidebound is, that the roots of the Grass are so interlaced, and so firmly matted together, as to resemble peat; that the blades of Grass sent up are so puny as scarcely to be able to penetrate the thick covering of dead though undecomposed vegetable matter, and that the roots and dead blades together form so impenetrable a thatch that the access of air and moisture is all but entirely prevented. Last autumn, after a continuance of wet weather, I examined a Grass field at Cramlington, laid out in the high, old-fashioned ridges. Whilst the furrows were so wet that every passing animal left its impress, the tops of the ridges were as hard and dry as in the height of summer. In fact, upon the removal of the turf, it was found that the rain had not penetrated the soil—that each ridge had turned off the water as well as any well-built and carefully covered corn stack. The consequence of this state of things need scarcely be mentioned. The rains not only bring down many substances fitted to promote the growth of plants, but, by percolating the soil, open a passage for the air; and then follow all those chemical changes in the soil without which vegetation must soon be at a standstill. In attempting to restore to hidebound land its proper degree of productiveness, all our endeavours must tend to the breaking up of this thatch, that air and moisture may be admitted, to promote the decomposition of the organic matter. Seeing a description of a scarifier in the 'British Husbandry' of the Library of Useful Knowledge, I had one constructed according to the plan there laid down, and tried it upon one portion of a field that was completely hidebound. After the land had been well combed and scarified, the whole field was top-dressed with lime and soil, at the rate of about 25 tons per acre. The produce was not weighed, but every one who saw it was of opinion that the scarified—which was the worst part of the field—carried twice as heavy a crop as the better, but unscarified portion. Scarifying was tried subsequently on several occasions, and in each with marked good effects. This implement is now in the possession of Mr. Stephenson, of Throckley, who has, I have no doubt, found it equally useful in improving his Grass lands. I hope other members of our Club will give this, or some other implement on the same principle a trial, and let us know the results. The answer that I should be inclined to give to this question is—That after the land has been well scarified, a heavy dressing of caustic lime (or of some other substance tending to promote the rapid decomposition of organic matter) be given in the autumn or early spring, and this well harrowed in."—Mr. D. F. Jones, a Fifeshire farmer (continued Mr. Glover), had written as follows:—"Hidebound Grass land, if I understand the term properly, is where there is, from a long continuance of pasturage, an accumulation of undecomposed or partially decomposed vegetable matter, which remains in this state from the want of free access of air, and its consequent decomposing effect. Undecomposed vegetable remains, instead of acting as a manure, act as a poison to the growing plants. Instance, peat. But when the various chemical elements which compose or build up these organic remains are freed from the organic combinations in which they existed when forming a part of an organised being, and on decomposition enter into other chemical (inorganic) combinations, they form a most valuable source of food for the living plant. Many of the members of the Newcastle Farmers' Club are well aware of one of the great distinctions between the vegetable and animal kingdoms—that the former requires that its food should be entirely of an inorganic nature, either derived from the mineral world or from organic decomposition. It is still doubtful if the parasitic plants are exceptions to this rule; but with this we have nothing to do here. The latter, the animal kingdom, requires that its food should be in an organised state. The food of animals consists of but a few of the chemical elements; and these must be presented in an organised form, whether animal or vegetable. Were it not so, a lump of charcoal, moistened with a few drops of spirit of hartshorn, would be nearly all that a man would require as food—a dinner the members of the Newcastle Farmers' Club would not much fancy to find on the table when they enter the dining room. If the hidebinding be caused by the accumulation of imperfectly-decomposed vegetable matter, the remedy will be simple—namely, admit the air, and employ such manures as will exercise a decomposing effect on the organic matter. To admit the air, I would recommend the use of a most efficient implement made by Mr. Slight, of Edinburgh, a subsoil-stirrer, worked by two horses. Harrows may also be used with advantage. Added to these mechanical operations, a dose of quicklime, or lime and salt; and if the pasture be very old, a dose of bone-dust. In recommending the subsoil-stirrer, I am supposing that the land is thoroughly drained. If not, let this be the first operation performed."—Mr. STEPHENSON said, in reply to the Chairman, that the scarifier named by Mr. Taylor, and which was now in his (Mr. S.'s) possession, consisted of 12 or 14 coulters, fixed in a frame, with a large wheel before it. These coulters could be driven 5 inches into the turf; and by using it first in one direction, and then crosswise, the ground was effectually cut up. He made use of it last spring. The season, since, had not been favourable, and he could hardly yet make any report of the result. He considered the question now under discussion to be one of very great importance. A great portion of the Grass land in this district, owing to the fog not being destroyed, did not produce one-third of the Grass which it was capable of yielding. He had tried different ways, and had come to the conclusion that the most effectual method of destroying the fog was to pare and burn. He had repeatedly hmed hidebound land—one field three times over—and had at last obtained a good herbage; but it had taken nine years to accomplish this—three successive dressings every three years. He had applied guano—and that method had failed. He had applied soot at the rate of 50 bushels per acre, which completely destroyed all vegetation for two years; but now the pasture was much improved. He found that paring and burning, and giving six loads of lime to the acre, was the most effectual method. You only lose one year's Grass by so doing. After the ashes and lime were applied to the land, and it was properly harrowed, the Grass and Clover seed should be sown, and the following year there would be a splendid pasture. He spoke from experience. He was aware that several members of the Club would condemn this plan, because the best of the land was for a time destroyed by the burning. But what of that, if by so doing you eventually made the land of greater value? He was quite satisfied, he repeated, that there was a large breadth of land not producing a third of what it would do, if the top soil were removed.—Mr. W. KELL remarked, that paring and burning had this recommendation, he understood, that it destroyed the ova of insects injurious to the crops.—The CHAIRMAN said, it was certainly a staggering remedy for hidebound land, to take the hide off altogether. What had Mr. Matthews to say on the subject?—Mr. MATTHEWS said paring was the most effectual remedy. Five acres of land were now under experiment at Beamish, by burning and other modes, and he would communicate the result at a subsequent meeting. There was a subsoil plough of Ransome's which was an excellent instrument, disturbing the whole of the soil without removing it. He must support the views of Mr. Stephenson. By his method you got a more thorough change of herbage, and quicker, and could apply whatever seeds you thought proper. II. "*Whether is it more profitable to fallow after Beans, when they are substituted for Grass seeds, so making a seven years' course, or to take a white crop after Beans, making an eight years' course, due regard being paid to the non-deterioration of the land.*"—The SECRETARY again read a communication from Mr. Hugh Taylor. "The finishing the course of cropping at the seventh instead of the eighth year," he said, "would be at once set down as a complete sacrifice of a crop, were it not that many good and money-making farmers consider the former course more profitable. The grounds of this preference I find it impossible to discover. It is acknowledged that land can be kept in condition under the usual four-course of cropping, provided we insure against the failure of the Grass seeds, by the substitution, occasionally, of some crop which shall neither impoverish the soil nor allow of its being overrun with weeds. Since the eight-years' course is merely that of the four-years repeated, Beans being substituted the second time over for Grass seeds, the Bean crop, since we are unable to continue the course by taking the usual white crop after it, must either impoverish the soil or render it foul. If either of these conclusions has any foundation, then the advocates of the seven-years' course may be in the right. Does, then, the Bean crop leave the land in a foul condition? There can be no doubt that when Beans are sown on foul land, in spite of the character they have for smothering weeds, they will leave the land in as bad (if not worse) condition than when they were sown, if the usual broadcast method is followed. But under these circumstances the hay crop would be equally liable to the objection. When, however, as in the Lothians of Scotland and in some parts of our own county, the Bean crop is drilled at intervals of 2 feet or more, repeatedly horse-hoed, hand-weeded, and set up in the same manner as Potatoes, it must, so far from leaving the land out of order, be one of the crops best adapted to the cleaning of it. In fact, on soils much addicted to the growth of weeds, the hay crop is found so much to encourage this tendency that the Bean crop is often substituted, for the sake of keeping the land clean. This, then, cannot be a sufficient reason for the omission of the white crop. Does the Bean crop exhaust the land more than the hay crop? From data afforded by 'Johnston's Lectures on Agricultural chemistry,' I have calculated that the following is the total amount of substances taken up by the crops in the usual four-course of husbandry:

	Inorganic Matter.		Organic Matter.	Total.
Fallow, Wheat, Oats,	536 lbs.	.....	8364 lb.	
Hay	209 lbs.	.....	4291 lb.	 13,400
Substituting Beans for hay:				
Fallow, Wheat, Oats,	36 lbs.	.....	8364 lb.	
Beans	210 lbs.	.....	4340 lb.	 13,450

We have, then, a balance of 50 lbs. per acre, or three-tenths per cent. on the gross produce, against the Bean crop—an amount scarcely appreciable at any time, but utterly lost sight of when we consider that this excess is in the organic constituents, and call to mind that the whole of the organic matter of plants may be derived from the atmosphere. It must, too, be of still less consequence in the nighbourhood of Newcastle, throughout which so great an amount of organic elements—in the forms of chloride and sulphide of ammonium, carbonic acid, &c.—is sent into the atmosphere, by the combustion of coal and refuse from the mines, and which must be brought down again, in quantity, by every shower. No account has here been made of the aftermath of the hay. I think we may say that it exhausts the land to at least one quarter of the extent of the crop of hay. If we take this view we shall have then:

Course with hay...	14,525
Course with Beans	13,450

Or the hay crop exhausts the land to the amount of 1000 lbs. more than the Bean crop. There is no doubt that though the total amount varies so little, yet the different constituents combined to form this total vary in the two crops. But even this is in favour of the Bean crop; for it deprives the land of a less weight of substances useful to the grain crops than does the hay. This may be seen by comparing the analyses of the two crops. Neither, then, can this ground of preference be sustained. In cases where an actual comparison of the two methods has been made, the sole evidence taken has probably been the succeeding Wheat crop. That this should be better by fallowing after Beans is only to be expected; since the great bulk of that nutritive matter in the soil, which might have been assimilated by the Oat crop (and this more especially of the soluble silicates, which would have been used in the building up of the stem and husk of the Oat), has been left in the soil as so much extra manure for the crop of Wheat. But let us try each course fairly, remembering that the manure must be proportional to the number and description of crops, and the land treated in a husbandlike manner when under the Bean crop, and I think I may venture to say we shall hear little more of fallowing after Beans."—Mr. ROBSON said, one course would be more profitable than another according to circumstances. On land naturally good, and in rich condition, like Mr. Stephenson's, no doubt an eight years' course was the most profitable; but on poor land it was advisable to fallow after Beans, and not to take a white crop, or you would make your poor land still poorer.—Mr. STEPHENSON differed from the last speaker. He seemed to think that he lived in Goshen. Let them only exert themselves, and they would bring their land into as high condition as any in Tyneside, if they would only expend capital. He considered that to fallow after Beans was farming land to perfection. By taking a crop of Wheat or Oats you were extracting from the land what was essential to the green crop. The method he would recommend was to fallow after Beans—then have a green crop—then Wheat, seed, two years Grass and Oats, fallow, Wheat, Beans, making an 8-years' course. By this method you always had your land in good heart, and your crops would be much improved, particularly Clover, of which, instead of having only a ton to the acre, and nothing but Rye-grass, you would, in a favourable year, have nearly three tons, and full of Clover. He had this year had a field in Clover which was fallowed after Beans, and the first cut weighed 2¾ tons per acre. The best way, he would repeat, to keep land in good heart, was to fallow after Beans. III. FAILURE OF THE BROAD CLOVER: *What is the reason assigned for the failure of the Broad Clover, and what means ought to be taken to prevent this loss?*—Mr. WEEKS said the cause of the failure, according to the general opinion, was that the land grew tired of growing the crop. Yet there were two fields near him—one of which had grown Clover every four years from time immemorial, and the other had only been sown with Clover this year—and the former had yielded an abundant crop, while the latter was almost a total failure.—Mr. COLBECK observed that the question was one of great difficulty. A neighbour of his who had been sorely baffled with his Clover, said he would *mak'* the land grow it, but he had been obliged to give in—the land beat him. He (Mr. Colbeck) had tried various experiments, but without arriving at any satisfactory conclusion. He did not think that the failure arose from the absence of inorganic constituents in the soil. The same land that could not be made to grow broad Clover would grow Beans, and the two crops required as nearly as possible the same constituents. A French writer on agriculture ascribed the failure to a parasitical plant, the Lesser Broomrape (or Orobanche minor). He said that in Flanders it had

been found that this plant, whose seed resembled that of the Clover, destroyed the crop. Perhaps the members of the club would keep a look-out, and see if they could detect it among their Clover. There was also another parasitical plant—the Clover Dodder (Cuscuta Trifolii), which might be a cause of the failure.—Mr. John Cookson said the general opinion was that the land became "Clover-sick." If the failure was caused by a parasitical plant, how came it that the same seed would give you a good crop on fresh land, although it gave you little or none on the old land?—Mr. Johnson said, he only knew that a crop of Clover was often very bad to come at. He had ploughed a field that had been in Grass 50 years or more, and sown it with Clover; and he had not a stem to cut. The field would not grow Clover. It was rather better the second year, certainly; but it was not so good as he looked for.—Mr. W. Stephenson said, he never wanted Clover; he always had plenty; but he only sowed it every eight years, and with Beans between. They might talk of chemistry as they liked, which had undoubtedly done much for us, but had enlightened us little as to the failure of the Clover; he was convinced that the principal cause of failure was from such frequent repetition.

Calendar of Operations.

JANUARY.

Lammermuir Sheep Farm, *Jan.* 21.—Winter has now fairly set in, and that with no ordinary severity. It began on the 28th December, when the thermometer fell to 19°, accompanied with a hurricane of wind. The frost has continued ever since with greater or less intensity, occasionally varied with slight showers of snow. In this way the surface of the ground was frozen to the depth of 7 or 8 inches, and a substantial foundation laid for a snow storm, which began in earnest on the 12th ult. The average depth is now between 18 and 20 inches; in many places the wreaths are from 6 to 10 feet deep. As it did not come on without sufficient warning, there was plenty of time to have the sheep laid in to proper shelter. We are now haying the whole of them, and considering that this is the first genuine snow storm our hills have experienced for six or seven years, the sheep are eating the hay much more greedily than we had anticipated. The common allowance is a stone to every score of sheep, or something like 1¼ lb. per head. As the snow is deep, and they can get very little heather, the hay is supplied to them morning and evening. The rams were removed from the ewes on the 5th ult., after having been among them for six weeks. They are now in an inclosure by themselves, and receive a small allowance of Turnips daily, just sufficient to keep them in moderate condition. Before the frost set in, we had succeeded in getting the greater part of our yellow Turnips either stored or earthed up with the plough. These, we trust, will be safe, though we are rather apprehensive for those which are still unprotected. The weather has been very unfavourable for either storing or earthing up. When free from frost, the ground was generally too wet for introducing a plough among them; for unless the soil be dry, it drags on the breast of the plough and makes very imperfect work, besides the poaching it causes, to the injury, as we think, of the succeeding grain crop, even though it be afterwards subjected to the influence of frost. Before the snow, the carting out of manure for Turnips, and top-dressing of a piece of old Grass with earth, was the principal work of the farm horses. Now, however, man and horse are fully occupied in providing with hay those lots of sheep which lie nearest to the steading. *A Lammermuir Farmer.*

Notices to Correspondents.

Agricultural Politics: *Falcon.* Your last article must be declined—with thanks.

Bad Butter: *S R S* asks, in the *Gazette* of Jan. 26, for the cause of his butter being bad both in texture and taste; cows fed on Mangold Wurzel and Beans, with scrupulous cleanliness in dairy utensils, but cream churned only once a week. My cows were fed last winter on Mangold Wurzel cut into shreds with a (Moody, Frome) Turnip-cutter, and mixed with hay and straw-chaff; butter made twice a week. The butter was good in flavour, but crumbled. In the spring I was able to add Rape to the above food, the butter immediately changed to a good texture, and improved in flavour; this change I attribute to the oily nature of the plant Rape. I have this winter used oilcake crushed, giving two quarts a day to each cow, three perhaps would not be amiss, with Mangold Wurzel, some few Swedes, and a sprinkling at times of Carrots, all cut up, being well cleared from dirt, and mixed with chaff. Butter is good both in texture and flavour, but I think it should be made winter and summer twice a week. I have used Beans, but find them neither so good nor so cheap as cake. *Thomas Sealy.*

Boxes, &c.: *A B.* The Peruvian Barley *we* would not buy at the price.—The descent into the boxes need not be more than 1 foot or 18 inches, and that is no great obstacle.

Farm Accounts: *C J S* will soon see the English Agricultural Society's account books. They are to be published by Mr. Sanford, 315, Oxford-street.

Fen Farm: *J W.* A letter addressed to you has been returned. Please to give your full address.

Hams and Bacon: *A B.* When properly salted, they will dry very well in a dry and airy outhouse without artificial heat, though not so quickly as when the atmosphere is dried by the assistance of such means. It will not answer to keep pork of 7 stones (of 8 lbs.), carcase weight, 12 months in pickle; as, in addition to becoming intolerably salt and losing weight, the fibre of the muscle of meat so young would not be sufficiently firm to resist the corroding action of salt; and if it were otherwise, such meat would be unsaleable in the provision market. Such meat may certainly be made into bacon, and, perhaps, best by a method much practised in Ireland with pork too small to cure in flitches, which is as follows, viz., after cutting off the ham to cure in the usual way, the whole of the bones are taken out of the flitch, which, after being in salt for 10 days or a fortnight, is hung up for a week to partially dry, after which it is tightly rolled up the lengthway of the flitch—the belly part inside, and the back the outside of the roll—and the roll secured by twine wound spirally at 1½ to 2 inches apart from one end of the roll to the other, after which the roll is hung up to complete the drying. It is very doubtful, however, that the above described, or any other, mode of curing pork so young would answer so profitable a purpose as selling it fresh for table, which at the weight named, if well fed and of a small kind, is well adapted for the London market. *J. E.*

Mr. Sadler on Rearing Calves: *Anon.* We have received an unfinished article on this subject, without signature.

Mummy Wheat: *J C.* We have looked back, but cannot find the advertisement you allude to. Wanted—the advertisement and an instance, with full particulars of fraud on the part of the advertiser, before we can do anything in the matter.

Patent Process for preparing Flax: *Spes.* If "T. S." can give any information with regard to the patent process of preparing Flax, "carried on at Old Bow with complete success in 1810," he may confer a great benefit on the country.

Peruvian Barley: We have to thank Messrs. Lee for a sample. It is a naked Barley not different in appearance from varieties of that species which have been often cultivated in this country before. The price (10*s.* a peck) at which it is advertised may not be more than enough to pay a reasonable profit on the cost at which it has been procured; but it is certainly far more than enough to hinder any reasonable man from purchasing it.

Pigeons: *Constant Reader.* The best in English is "A Treatise on Domestic Pigeons," 8vo, with copper-plates. London, 1765. Both the text and the figures of this have been shamelessly pirated. It is scarce—a copy with coloured plates fetched a guinea, and we were fortunate in getting an uncoloured copy for 6*s.* It treats of fancy pigeons only. There is the "New and Complete Pigeon Fancier," by Daniel Girton, Esq., of the county of Bucks (London: T. Kelly, Paternoster-row, no date). This is probably out of print; price 1*s.* There is the "Pigeon Keepers' Guide," price 6*d*, by James Rogers (a dealer), of the City-road (Dean and Co., Threadneedle-street), from the latest and best authorities. It has some fair woodcuts. "Farming for Ladies" has a chapter on the subject. Temminck's "Histoire des Pigeons et Gallinacé" (never translated), has some interesting particulars; but he mainly directs his attention to the wild and foreign species, viewing them as a naturalist rather than a poultry keeper. *D.*

Poultry: *A Midland Subscriber* may apply to Mr. James Bissell, Bradford-street, Birmingham.

Spade Husbandry: *A B.* Will "J. R." say what quantity of Beans and Beet his friend the carpenter obtains per acre by double culture, and if he has ever tried Carrots as a double crop with Beans, successfully.

Sheep in Orchards: *E L* says, "One of your correspondents asks whether sheep are injurious to orchards. They are so, if the oil of their fleeces is allowed to come in contact with the fruit trees, and poison the bark; but if the fruit trees are protected either by being staked or thorned, or what is better still, if they are planted on a slight eminence, so that the sheep has no comfortable standing place to rub, the orchard will be uninjured."

Willows: *A Correspondent* asks if any of the readers of the *Chronicle* or *Gazette* will obligingly furnish information on the cultivation of Willows. The kinds most profitable, the best method of cultivation, with reference especially to marshy lands near rivers and lakes, and the best way of setting to work to establish a basket factory where none has existed before; this and any other information on the subject of turning marshy lands (incapable of being thoroughly drained) to profit, will be thankfully received.

Worcester Agri. Society: *Somerset* will be very much obliged, and no doubt many other readers of the *Gazette*, if Mr. Webb or Mr. Oldaker will state the quantity of guano applied per acre, and also how applied, and whether the 35 tons 2 cwt. 3 qrs. 12 lbs. of Swedes obtained per acre were Turnips only, or with the tops and tails.

Young Cattle: *F Hale.* We should prefer keeping young stock in small sheltered yards to tying them up. In the former case they will probably eat less food; but in the latter, though they eat more, they will at the same time exceed the others more in thriving than they do in eating. Swedes and good hay are of course first-rate food for any kind or age of stock.

*** Communications reaching town after Wednesday cannot be answered the same week.

Markets.

COVENT GARDEN, Feb. 2.

The supply of Vegetables is pretty well kept up, and Fruit for the most part is sufficient for the demand, except Pears and Apples, which are scarce. Hothouse Grapes and Pine-apples are good for the season—the former rather scarcer. Filberts and Walnuts are abundant, and Chestnuts plentiful. Oranges and Lemons are abundant, and there are now some good Seville Oranges in the market. Amongst Vegetables, Turnips and Carrots are good, Cauliflowers and Broccoli sufficient for the demand. Potatoes are unaltered since our last account; some foreign ones are in the market, at from 50*s.* to 70*s.* a ton. Lettuces and other salading are dearer, and so are Mushrooms. Some French Beans, Asparagus, Seakale, and Rhubarb may be obtained. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

FRUITS.

Pine-apples, per lb., 5*s* to 8*s*	Almonds, per peck, 6*s*
Grapes, hothouse, p. lb., 6*s* to 8*s*	— sweet, per lb., 2*s* to 3*s*
— Portugal, per lb., 9*d* to 1*s*	Walnuts, p. 100, 1*s* 6*d* to 2*s*
Pears, per doz., 6*s* to 10*s*	— p. bush., 16*s* to 24*s*
Apples, kitchen, p. bsh., 4*s* to 6*s*	Filberts, per 100 lbs., 60*s* to 65*s*
Lemons, per doz., 1*s* to 2*s*	Nuts, Bar., p. bush., 20*s* to 22*s*
— per 100, 6*s* to 12*s*	— Brazil, p. bsh., 12*s* to 16*s*
Oranges, per doz., 9*d* to 1*s* 6*d*	Kent Cobs, 65*s* to 75*s* p. 100 lbs
Oranges, per 100, 5*s* to 12*s*	

VEGETABLES.

French Beans, p. 100, 2*s* 6*d* to 3*s*	Radishes, p. 12 hands, 1*s* to 1*s* 6*d*
Seakale, per punnet, 1*s* to 2*s*	Carrots, per bun., 6*d* to 8*d*
Asparagus, per bundle, 3*s* to 6*s*	Spinach p. sieve, 2*s* to 3*s*
Rhubarb, p. bundle, 1*s* to 1*s* 6*d*	Onions, p. bushel, 3*s* to 4*s*
Cabbages, p. doz., 9*d* to 1*s*	— Spanish, p. doz., 1*s* 6*d* to 4*s*
Cauliflowers, p. doz., 6*s* to 9*s*	Shallots, per lb., 4*d* to 8*d*
Broccoli, p. doz. bundl., 18*s* to 24*s*	Garlic, per lb., 4*d* to 8*d*
Greens, per doz., 2*s* 6*d* to 4*s*	Lettuce, Cab., p. sc., 4*d* to 9*d*

Cucumbers, each, 3*s* to 3*s* 6*d*	— Roots, p. bdle., 1*s* to 1*s*
Leeks, per bunch, 2*d* to 3*d*	Marjoram, per bunch, 2*d*
Celery, p. bundle, 8*d* to 2*s*	Mint, per bunch, 9*d* to 1*s*

SMITHFIELD, Monday, Jan. 28.

We have a good supply of Beasts, and trade is dull at barely late rates. The number of Sheep is small, but quite adequate to the demand, which is very limited; our highest are extreme quotations. Calves being scarce sell readily at good prices. From Holland and Germany we have 120 Sheep and 49 Calves; from Spain, 21 Beasts; from France, 25; from Scotland, 340; from Norfolk and Suffolk, 2100; and 500 from Lincoln, Leicester, and Northampton.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	10 to 4	0	
Best Short-horns	3	6 — 3	8	
2d quality Beasts	2	6 — 3	2	
Best Downs and Half-breds	4	0 — 4	4	
Ditto Shorn				

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	6 to 3	8	
Ditto Shorn				
Ewes & 2d quality	2	10 — 3	4	
Ditto Shorn				
Lambs		—		
Calves	3	8 — 4	8	
Pigs	3	4 — 4	4	

Beasts, 3524; Sheep and Lambs, 16,850; Calves, 85; Pigs, 210.

Friday, Feb. 1.

The supply of Beasts is a fair average, both as regards numbers and quality. Trade is very dull, and Monday's quotations cannot be maintained; indeed, several remain unsold. The number of Sheep is small, consequently they are cleared off cheerfully at fully late rates, but at no quotable advance. There are but few Calves on offer; trade is brisk at Monday's rates. Trade is more brisk for Pigs, the dead markets being clearer. From Holland and Germany there are 29 Beasts, 100 Sheep, and 58 Calves; from Scotland, 140 Beasts; from Norfolk and Suffolk, 200; and 121 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	8 to 3	10
Best Short-horns	3	6 — 3	8
2d quality Beasts	2	6 — 3	0
Best Downs and Half-breds	4	0 — 4	4
Ditto Shorn		—	

Best Long-wools	3	6 to 3	8
Ditto Shorn		—	
Ewes & 2d quality	2	8 — 3	4
Ditto Shorn			
Lambs			
Calves	3	6 — 4	8
Pigs	3	6 — 4	6

Beasts, 824; Sheep and Lambs, 1690; Calves, 164; Pigs, 240.

HAY.—Per Load of 36 Trusses.

Smithfield, Jan. 31.

Prime Meadow Hay	66*s* to 72*s*		Clover	60*s* to 80*s*

New Hay	—	—	Straw	22	26
Old Clover	80	84			

POTATOES.—Southwark, Jan. 28.

The Committee report that there have been but few arrivals since our last report, which has enabled salesmen to effect a clearance of stored Potatoes to a certain extent. The following are this day's quotations:—Yorkshire Regents, 90*s.* to 130*s.* per ton; Wisbeach do., 70*s.* to 100*s.*; Scotch do., 70*s.* to 80*s.*; Scotch common whites, 50*s.* to 60*s.*; French whites, 60*s.* to 80*s.*; Belgian do., 60*s.* to 70*s.*

HOPS.—Friday, Feb. 1.

Messrs. Pattenden and Smith report that the market continues the same for all fine Hops.

MARK LANE.

Monday, Jan. 28.—The supply of Wheat by land carriage samples from Essex and Suffolk this morning was small, but good from Kent; and although offered at a decline of 1*s.* to 2*s.* per qr., a considerable quantity remained unsold towards the close of the market. Holders of foreign being generally indisposed to allow of any reduction, very little business was transacted.—English malting Barley is fully 1*s.* per qr. lower; foreign grinding supports the rates of Friday last.—Beans are unaltered in value.—We reduce our quotations 1*s.* per qr. for white Peas.—Former prices are fully maintained for Oats, but the trade is not brisk.

Friday, Feb. 1.—There has been a moderate arrival of foreign Wheat, good of Barley, during the week, and small of other descriptions of grain. This morning's market was badly attended, and the value of all corn entirely nominal, with a decidedly downward tendency in prices, for every sort excepting Oats.—The corn trade throughout the kingdom since the 25th ult. has continued depressed, and a decline of fully 1*s.* per qr. in the value of English Wheat and Barley has been very general. In Dantzic the supplies by land-carriage have been bought at a decline of 2*s.* per qr., but old sorts remain nominally as before. In the other Baltic ports the continued dull accounts from this side have caused buyers to pause, and business to become dull, but prices are unaltered, supplies having fallen off, and both buyers and sellers appearing satisfied that the Wheat crop throughout that country was a small one. The Belgian markets are heavy, and 61—62 lbs. Antwerp and Louvain Wheat quoted 35*s.* 6*d.* to 37*s.* f.o.b. In Leghorn, on the 23d ult., quotations for Wheat were as high as in our own markets. In Naples we find prices have declined; good Barletta is quoted at 33*s.*, freight to U. K. 6*s.* per qr. In Odessa, on the 14th ult., the stock of soft Wheat consisted of 375,000 chwts. of which 280,000 were in first hands, and 95,000 belonged to exporters; the 280,000, however, consisted of light ordinary qualities. Good new Polish was quoted at 30*s.* to 32*s.* 6*d.*; and old at 28*s.* to 30*s.*

Arrivals this week.

— — foreign, do.	— —	Tares, per bush.	4*s* 6*d* — 5*s* 6*d*

Liverpool, Tuesday, Jan. 29.—The imports this last week are on a larger scale than for some time past. During the week the grain trade has been quite inactive, and the quotations nearly nominal. There was a limited attendance at this day's market. Wheat was in moderate demand from the town dealers, and in most cases declined 1*d.* per bushel. Oats declined about 1*d.* per bushel. Barley, Beans, and Peas were each alike dull. Indian Corn was not in such good demand today, and was from 6*d.* to 1*s.* per qr. cheaper.

Sales by Auction.

MESSRS. LODDIGES' CELEBRATED ARBORETUM FOR SALE BY AUCTION.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.

MR. J. C. STEVENS is favoured with instructions from Messrs. LODDIGES, of Hackney, to submit for unreserved competition, on the premises, on MONDAY, 4th March, and several following days, in consequence of the decease of the Senior Partner, the FIRST PORTION OF THEIR UNRIVELLED ARBORETUM, comprising many thousand well-grown specimens of the rarest and most beautiful Trees and Shrubs, affording to noblemen and gentlemen engaged in Ornamental Planting an opportunity which has never before occurred.—Catalogues are preparing, and will be ready for delivery 10 days prior to the sale, on the premises, and of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

AMERICAN PLANTS.

MR. D. A. RAMSAY has received instructions from an eminent firm to sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton, one mile from Hyde-park Corner, on WEDNESDAY, February 13, 1850, at 12 o'clock precisely, without reserve, 500 Rhododendrons, 2 to 4 feet, 150 Scarlet Rhododendrons, and other American plants, comprising Azaleas, Andromedas, Sedums, Ericas, &c.; 400 Standard, Dwarf, and Climbing Roses, a quantity of strong Vines and Fig Trees, Ilex Cunninghami, Cupressus, Daphne, Pinus, Garrya elliptica, Lycium horridum, &c.; a quantity of Ornamental Trees and Shrubs, comprising Scarlet Chestnut, Ailanthus, Thorn, Weeping Cherry, American Willow, Tulip Tree, &c.; Ribes, Caragana, Cotoneaster, Benthamia, Cytissus, Hibiscus, &c.; with other miscellaneous stock, comprising Pyrus japonica, Clematis, and other creepers; Victoria Rhubarb, Asparagus, Ash-leaved Kidney Potatoes, and a quantity of Bulbs and Bulbous Roots.—May be viewed the day prior and morning of sale, and Catalogues had at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

NOTTING-HILL.—TO GENTLEMEN, BUILDERS, NURSERYMEN, AND OTHERS,

MR. D. A. RAMSAY will sell by Auction, on the premises (adjoining the Clarendon Hotel, Clarendon-road, Notting-hill), on WEDNESDAY, February 6, 1850, at 1 o'clock precisely, without reserve (from the stock of a Country Nurseryman, and removed for convenience of sale), a quantity of Ornamental Trees and Shrubs, 500 Standard and Dwarf Roses, 2000 Evergreens, Pinus, Rhododendrons, &c., with other Stock.—May be viewed the day prior and morning of Sale; and Catalogues had at the Clarendon Hotel, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

BROMPTON AUCTION GROUND.

D. A. RAMSAY begs leave to offer his Services to the Trade and others as an AUCTIONEER, VALUER, &c., and trusts that by devoting his personal attention, with strictly moderate charges, to give satisfaction.

Parcels of Stock, &c., received and offered for Sale by Auction on the above premises.

D. A. R. begs to state that all goods or stock sent to him for Sale by Auction, must be delivered on to the premises prior to being advertised for sale.—Letters addressed to Mr. D. A. RAMSAY, Auctioneer, &c., Brompton Auction Ground, Fulham-road, Brompton, promptly attended to.

TO FLORISTS AND OTHERS.

TO BE DISPOSED OF, on reasonable terms, the Lease, Stock, &c., of a FLORIST AND SEED BUSINESS, situate five miles from the City, and in one of the best neighbourhoods round London. The greater portion of the premises are newly erected, and comprise a Dwelling-house, commanding Show-house and Seed-shop, with Stove and five Plant-houses, Pits, &c., the whole of which are heated by Hot Water on the most approved principle. The Glass may be either taken at a valuation with the stock or at a rental.—For further particulars apply to Mr. D. A. RAMSAY, Auctioneer, &c., Brompton Nursery, Brompton, Middlesex.

TO NURSERYMEN AND OTHERS.

TO BE DISPOSED OF, an old established NURSERY, about 100 miles from London, and in the immediate neighbourhood of a fashionable watering-place, the owner retiring from the business. The stock comprises a large quantity of Evergreens, Rhododendrons, &c. To any person who could command a small capital, this would prove a most advantageous opportunity.—For further particulars, apply to Mr. D. A. RAMSAY, Auctioneer, &c., Brompton Nursery, Brompton, Middlesex.

TO THE SEED TRADE.

TO BE DISPOSED OF, on easy terms, a well-established RETAIL SEED BUSINESS, in one of the best inland towns of Ireland. There is also a small Nursery attached. The terms of entry will be simply the purchasing of the Stock at a fair valuation. This offers an excellent opportunity for an active young man with a small capital.—For particulars, apply to F. S., 58, Dawson-street, Dublin.

ESSEX.—TO NURSERYMEN, HORTICULTURISTS, FLORISTS, AND MARKET GARDENERS.

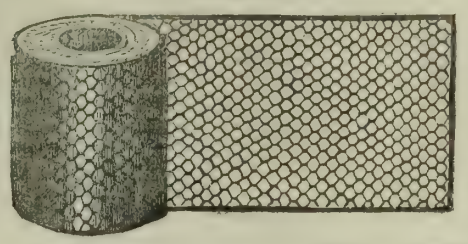
TO BE LET, with immediate possession, the singularly desirable Estate known as GLAZENWOOD, for many years occupied by Mr. CURTIS, and situate near to the towns of Braintree and Coggeshall, and within 2½ miles of a Railway Station. It comprises a Villa Residence, a commodious Messuage, large Conservatory, Counting-house, Barn, Fruit-rooms, Stable, and other convenient Buildings, with about 45 acres of superior Land, of which 10 acres, or thereabouts, form the celebrated American Gardens and Nursery Grounds; the remainder is chiefly planted with the choicest Fruit Trees; and the whole abounds with choice Stock in every variety, for which these grounds have for so many years been so justly celebrated.—For rent and other particulars apply to Messrs. BEAUMONT and THOMPSON, 19, Lincoln's-Inn-Fields, London; or to Messrs COOK and SONS, Land Agents and Auctioneers, Stratford St Mary, Suffolk.

IMPORTANT TO MILLERS AND OTHERS.

TO BE LET, with immediate possession, in the neighbourhood of Bristol, a FLOUR MILL, of excellent construction and unrivalled situation, driving four pairs of French stones, combining advantages in transit of goods both by rail and water scarcely equalled. The whole new and in full work. Any one wishing to treat for the above is requested to apply by letter, post-paid, to G. F., at Mr. Symes', Cheese Factor, Temple-street, Bristol.

WALHAMPTON, NEAR LYMINGTON, HANTS.

TO BE LET, and entered on immediately, WALHAMPTON FARM, with the requisite Homesteads and Out-buildings.

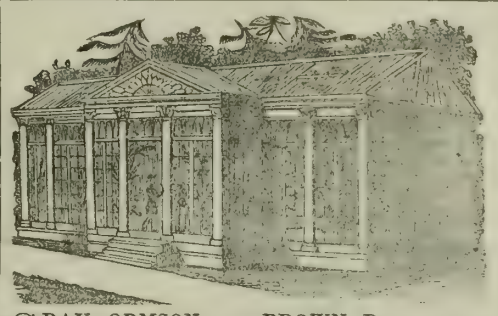


The Farm contains	A.	R.	P.
Pasture	84	1	1
Arable	176	2	8
	260	3	9

For further particulars, apply to Messrs. MOORE and ST. BARBE, Solicitors, Lymington, Hants. N.B. No one need apply who has not a capital of 3000*l.*

TO BE DISPOSED OF, a small NURSERY and SEED BUSINESS in the country, returning about 700*l.* per annum; has been established 10 years, and increasing every year; the stock is young and healthy, contains about 3 acres of land, greenhouse, &c.; the stock and fixtures to be taken at a valuation or otherwise, as agreed upon.—For further particulars apply to Messrs. HURST and Co., Seedsmen, Leadenhall-street, London; or to A. B., Office of this Paper.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION, especially with regard to Agriculture, under the immediate patronage of the Right Hon. Lord RENDLESHAM, M.P.; conducted by Mr. G. DOWNES. The Classical and Mathematical branches are entrusted to a Graduate of Cambridge; the Commercial and other departments to efficient assistant masters. A Laboratory, Collection of Philosophical Apparatus, Library, &c., are attached to the school. Terms are moderate and inclusive, and may be known upon application to Mr. G. DOWNES, Wickham Market, Suffolk.



GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh,	light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch "	strong " ...	9 "	6½ "
2-inch "	extra strong " ...	12 "	9 "
1⅝-inch "	light " ...	8 "	6 "
1⅝-inch "	strong " ...	10 "	8 "
1⅝-inch "	extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

GRAY, ORMSON, AND BROWN, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any enquiries. They beg also to say the building only is referred to, as the Heating Apparatus was not erected by them.

GRAY, ORMSON, and BROWN, have also the honour of referring to many of the nobility and gentry in the country, and to several of the London Nurseries.

N.B. Plans and Estimates furnished free.

AGRICULTURAL.

MR. EDWARD RYDE (formerly SANDERSON and RYDE), LAND SURVEYOR; DRAINAGE, HYDRAULIC, and AGRICULTURAL ENGINEER; LAND AGENT, &c., will send free, on the receipt of 14 postage stamps, A COMPLETE READY RECKONER, and very plain instructions for Measuring and Valuing Hay Ricks.

N.B. Professional favours respectfully solicited.

14, Upper Belgrave-place, Eaton-square, London.

WANTED TO BE EFFICIENTLY DRAINED, about 150 Yards of GRAVEL WALK, near Holloway. The bottom is stiff Clay, about 12 inches under the surface, and a fall from front to back of Garden of about 6 feet; the main Drain being at the bottom of the Garden, and the Garden about 50 yards from front to back.—Price, with method of draining, inclose to A. B., Mr. Hughes, 15, St. Martin's-le-Grand, London.

TO THOSE WHO CAN FEEL FOR THE SICK AND DESTITUTE.—The Orphan of a Clergyman (widowed) having her little son very ill, and whose only subsistence has of late been earned by shop-work, supplicates from the feeling a little aid in this hour of suffering and affliction; even a few stamps would procure a little nourishment.—Address to C. L., Post-office, Paddington. C. L. implores the benevolent to visit her sick and hopeless dwelling.

CLOSE OF HOLIDAYS.—Now that the season of annual festivity is about to terminate, and the respective boarding-schools be re-instated by the busy throng of youthful aspirants, their personal comfort and attractions become naturally an object of great solicitude with friends and relatives. Now it is that ROWLAND'S MACASSAR OIL, for accelerating the growth and for improving and beautifying the hair; ROWLAND'S KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions; and ROWLAND'S ODONTO, for beautifying the teeth and preserving the gums, must be universally considered indispensable. The august patronage conceded by all the Sovereigns of Europe to these creative and renovating specifics, and the confirmation, by experience of their infallible efficacy, have characterised them as perfect and given them a celebrity unparalleled.

*** Beware of SPURIOUS IMITATIONS!!!

The only genuine of each bears the name of "ROWLAND'S" preceding that of the article on the Wrapper or Label.

Sold by them at 20, Hatton-garden, London, and by respectable Chemists and Perfumers.

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., F.R.S., F.L.S., F.G.S.; HON. MEMB. ROY. AGR. SOC. ENG.; Professor of Chemistry to the Horticultural Society of London; Lecturer on Chemistry in the Hon. E. I. Co.'s Military Seminary at Addiscombe, &c.

Published by JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle and Agricultural Gazette*, 5, Upper Wellington-street, Covent-garden; and may be ordered of all Booksellers.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

TO THE FARMERS OF ENGLAND.

MARY WEDLAKE AND CO.,

ENGINEERS AND MACHINE MAKERS TO THE HON. BOARD OF ORDNANCE, WOODS, WORKS, EASTERN COUNTIES, AND SOUTH-EASTERN AND BRIGHTON RAILWAYS, &c.

The Daughter of the late Mr. Thomas Wedlake, begs sincerely to return her thanks to those friends of her late father, who for the last six years have so kindly bestowed their patronage on her Establishment, the *Original Implement Factory*, founded upwards of 40 years, at Hornchurch, known under the name of the Fairkytes Iron Works; and she begs also to remind gentlemen farmers generally, that in conformity with the wishes of her deceased parent, she continues to carry on the same business under the name of MARY WEDLAKE and Co. Upon an inspection of their various Machines, gentlemen connected with Agriculture will find all kinds of Machinery recently much improved; and M. W. and Co., being determined to meet the times, and being in a position to do so, they have made considerable reduction in their prices. They beg to draw the attention of their friends to the new 4-horse Threshing Machine, which, if it does not surpass, at least is equal to steam power, without a tenth of the expense and danger attending it.

The above Machine will be found made of the very best materials and of first-rate workmanship, with self-oiling boxes, which prevent the brasses and other parts from giving way.

NUMEROUS REFERENCES CAN BE GIVEN.

"Weybridge Farm, Hornchurch, July 29, 1846.

"Sir,—In answer to your letter respecting the Threshing Machine I had from Mrs. Wedlake, I beg to say that I am perfectly satisfied with it. It does its work very clean, without injuring the straw, and it will thresh faster, and is easier for the horses, than any machine of this description that I have ever seen; for my part, I do not see that there are any improvements wanted. Yours respectfully,

Anthony Vince."

"To Mr. Bunn, Farmer, Herts."

Mr. Blewitt says, "I threshed 20 sacks of Oats in one hour, 3 loads of Wheat-straw per hour, and upwards. We have threshed upwards of 2000 of all sorts of grain in 12 months, without a shilling of expense for repair."

Mr. J. Lee: "I never saw such a machine before. We cannot get sufficient hands to feed it."

Mr. P. Brown: "We have done upwards of 60 quarters per day; straw uninjured; two quarters and a half of Rye in little more than an hour."

Mr. Washbourn: "In all the course of my experience as a farmer, I never saw a machine of such power, and so substantially constructed."

All letters to be addressed to Mary Wedlake and Co., in full, the Fairkytes Iron Works, 118, Fenchurch-street, City; or 5 Stand, Mark-lane. A list of the different articles made at the Works may be had on application.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The following are the days appointed for the EXHIBITIONS at the Gardens this season:

GENERAL EXHIBITIONS — WEDNESDAYS, May 8th, June 12th, and July 3d.

AMERICAN PLANTS, SATURDAYS, May 25th and June 1st.

N.B.—FRUIT will be exhibited on June 12th and July 3d.

EXTRA GRAND HORTICULTURAL EXHIBITION, PRIZES £200.

THE DEVON AND EXETER BOTANICAL AND HORTICULTURAL SOCIETY intend holding an Extra Grand Exhibition on Wednesday and Thursday, the 17th and 18th days of July next, during the meeting of the Royal Agricultural Society, at Exeter. Competition will be open to all Subscribers to the funds of the Society of 1*l.* 1*s.*, not being nurserymen or dealers in plants. Schedules of the Prizes may be obtained on application to the Honorary Secretary, T. WILLIAM GRAY, Esq., 4, North-bridge, Exeter.—Feb. 9.

RHODODENDRON PONTICUM FOR UNDER COVER, &c.

JOHN WATERER begs to state he has large quantities of the above, which is now universally acknowledged the best Evergreen for such purposes, being free from attacks of hares and rabbits. Strong plants, fit for immediate planting, 10*s.* 6*d.*, 15*s.*, to 21*s.* per 100.

Descriptive Catalogues of his well known collection of American Plants, &c., to be had on application.

American Nursery, Bagshot, Surrey.

THE NEW RED ASH-LEAF KIDNEY POTATO, very prolific, and has never yet been known to take the disease; it is one of the earliest Potatoes yet introduced, and keeps so well, that at the present time it boils very mealy, and is the best Potato for the table.

TRUE OLD ASH-LEAF	Per peck	3*s.* 0*d.*
SODEN'S EARLY OXFORD	„	2 6
NEW EARLY TEN-WEEK	„	3 0
FORTY-FOLD, FLOUR-BALL, & others	„	4 0
	„	2 0

The above are particularly recommended by JOHN SUTTON and SONS, Reading, Berkshire.

*** *Carriage free to London, Bristol, Basingstoke, and all intermediate Stations.*

POLYANTHUS SEED.

JAMES WOODS has a quantity of POLYANTHUS SEED (which he can recommend with confidence), saved from none but named and good marked flowers. Price 1*s.* per packet, or sent free on receipt of 13 postage stamps to JAMES WOODS, Florist, Harwich.

FIRST-RATE NEW FUCHSIAS, VERBENAS, GERANIUMS, DAHLIAS, PANSIES, STOVE, GREENHOUSE, BEDDING PLANTS, &c.

WM. RUMLEY AND SON'S DESCRIPTIVE CATALOGUE of the above, containing full Descriptions of their splendid new Seedling FUCHSIAS, PETUNIAS, and ANTIRRHINUMS, is now ready, and may be had on application, at prices worthy the attention of the Trade.

Gilling, Richmond, Yorkshire.

CEDRUS DEODARA OR HIMALAYA CEDAR.—The Subscribers beg to inform the admirers and planters of the above hardy Tree, that they have upwards of FIFTY THOUSAND, from one to five years old, in pots, grown from seed, constantly in the open ground, which they are now supplying on such terms as will induce their general introduction into all plantations, being of rapid growth, highly ornamental, and of great value as a Timber tree.

WM. MAULE and SONS, Stapleton-road Nurseries, Bristol.

P.S.—Should any of the trade abound in seedling plants of the South American Pines or other desirable hardy Conifers, Deodars can be had in exchange on equitable terms.

☞ This will not be repeated.

EARLY TEN-WEEK POTATO, the earliest grown, will beat the Ash-leaved Kidneys by ten days—per bushel, 14*s.*; per peck, 4*s.*, bags included. Pure Stocks of ASH-LEAVED KIDNEYS, RED DITTO, BARHAM'S WALNUT-LEAVED, SHAWS, REGENTS, FORTY-FOLD, &c., at moderate prices.

Twelve of the newest and rarest Flower Seeds:

Nemophila maculata	Martynia angularis
Brachycoma, splendid hybrids	Portulaca Thorburnii (yellow)
Phlox Drummondii alba	„ alba striata
„ oculata	Podolepsis chrysanthemoides
„ Leopoldina	Schizanthus retusus alba
Martynia fragrans	Ipomœa Burridgii

One packet each 10*s.* 6*d.*

GERMAN STOCKS, from 2*s.* per collection.

„ ASTERS, from 3*s.* „

„ CARNATIONS, 2*s.* 6*d.* per 100.

DUNCAN HAIRS, 109, St. Martin's-lane, Charing-cross, London.

WHITETHORN AND BEECH FOR FENCING—500,000 very fine four years old transplanted WHITETHORN, at 6*s.* per 1000, or, selected, at 7*s.* 6*d.* per 1000; and fine Bedded BEECH, 2 to 3 feet, at 8*s.* per 1000. A large quantity of very fine transplanted OAKS, ranging from 3 to 5 feet, at 35*s.* per 1000. The above are all extremely fine and well rooted. Samples if required.

ARTHUR MACKIE, Nurseries, Norwich.

RENDLE'S DESCRIPTIVE CATALOGUE OF SEEDS can still be obtained GRATIS, on receipt of two penny stamps, to pay the postage.

OPINIONS OF THE PRESS.

Dr. LINDLEY, in the *Gardeners' Chronicle*, Dec. 22, 1849, says, "*This contains lists of good vegetables, with useful notes appended to the names of many of the sorts. . . . It is a well-arranged Catalogue, and will be found of service to all purchasers of Seeds.*"

The Editor of "The Midland Florist," for January, 1850, says, "*We have just received the General Catalogue of Garden, Agricultural, and Flower Seeds, sold by William E. Rendle and Co., Plymouth, which, from its excellence, well merits something more than a passing notice, and happy shall we be from time to time (with Messrs. Rendle's permission) to extract some of its valuable information for the benefit of our readers. . . . The Flower Seed List is peculiarly comprehensive, and gives to each variety its scientific name, hardihood, time of duration, colour, height, and time of flowering. Our readers will thus see that, from its immense utility, we can scarcely say too much in its recommendation; and we are sure that the name of the eminent firm will be a sufficient guarantee that every article they send out will not only be true to name, but also of the best possible quality.*"

Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

SEEDS IN COLLECTIONS,
OF THE BEST WHICH CAN BE PROCURED.

BASS AND BROWN beg to offer the following CHOICE VEGETABLE SEEDS.

Complete Collections of the best and newest sorts, in proportionate quantities of each, suited for large or small gardens, at per collection, 1*l.*, 2*l.*, and 3*l.* A Collection for a small garden, of good sorts, at 10*s.* 6*d.* A List of the Collections furnished if required.

SELECT AND CHOICE FLOWER SEEDS,

Free by post, with full directions for sowing, heights, colours, &c.

20 vars. choice hardy Biennials and Perennials, 7*s.* 6*d.*, 12 for	5	0
36 varieties imported German Stocks	5	0
20 ditto ditto, 3*s.* 6*d.*, 12 for	2	6

Remittances with orders are requested from unknown correspondents. Goods carriage free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.

Our Descriptive Priced Catalogue, stamped to go free by post, may be had gratis.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

NATURAL GRASS SEEDS, FOR PERMANENT PASTURES, AND IRRIGATED OR CATCH MEADOW.

Which may be had Separate, or Mixed, expressly to suit the soil.

MESSRS. JOHN SUTTON AND SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of various kinds of Grasses which grow naturally in the various soils of England and Wales, for the purpose of introducing an improved system of laying down land to permanent pasture, are thereby enabled to supply the sorts and quantities of Seeds best adapted to suit the soil for which they are intended; and *at much less expense* than is usually incurred. Particulars will be forwarded by post.

Also Finest Lawn Grasses and Mixtures for improving old Pastures. Ashcroft, Liverpool, and other Swedes, White Belgian and other Carrots, Yellow Globe and other Mangolds. True Italian Rye-grass, Drumhead Cow Cabbage, Kohl Rabi, &c.

Reading Seed Warehouse, Reading, Berks.

THE "GREAT BRITAIN" CUCUMBER.—Cucumber growers and others who are desirous of growing a long and handsome variety of black spine Cucumber, and a prolific bearer, fit for any season of the year, may obtain it of W. HARRIS, Strawberry Cottage, Brook-street, Upper Clapton, in packets of 6 seeds, for 2*s*, in postage stamps.

Extract from the Gardeners and Farmers' Journal, of May 5th, 1849.—"I send you the particulars respecting the Cucumbers I forwarded for your inspection. Mr. Hunter, gardener to N. Clepton, Esq., Islington, purchased some of the seeds of my Great Britain Cucumber, and he now complains that his fruit is not so long as those he saw at my place last August. He cut the first fruit on the 14th of April, and he has cut 12 since, none of which are shorter than the one you saw. He has, besides 12 fruit on two plants at the present time, from 18 to 21 inches in length. These I saw myself, and none of them are fit to be cut; they will of course grow to a much greater length. W. HARRIS"

[We may, in reference to this matter, observe that Mr. HARRIS forwarded us for inspection one of his Great Britain Cucumbers, which measured exactly 24 inches in length; it is a handsome, well grown fruit, and fit for table. We think this is not bad Cucumber growing in such a season as we have had for the last five or six weeks.]

VERBENA—"WONDERFUL."

G. MOORE begs to refer the readers of this Paper to his Advertisement of the 2d inst.

Perry Barr, near Birmingham, Feb. 9.

THORNS, LARCH, SCOTCH, SPRUCE, &c.

JOHN STEWART AND SONS, Dundee, have large stocks of fine 2 and 3 years transplanted THORNS; LARCH, 1½, 2, and 3 feet; Scotch, native, 1 and 2 years transplanted; NORWAY SPRUCE, 1, 1½, and 2 feet; WEEPING BIRCH, 1½ to 2 feet, and 2 to 3 feet. They will be sold cheap.

Seedling Forest Trees, Shrubs, &c. Lists and prices may be had on application.—Dundee, Feb. 9.

(This Advertisement will not be repeated.)

RENDLE'S TRUE WILLCOVE BROCCOLI.—*This superior variety has been proved by thousands to be the best late sort in cultivation, and can be recommended with much confidence. We have saved a small quantity this season on our own grounds, from some of the finest heads ever seen; price* 1*s.* *per packet, free by post.*

*** Twenty packets to the Trade for 12*s*, or 50 for 2*l.* 10*s.* It will give the most complete satisfaction.

Our commercial stamp is on each packet.

COLE'S SUPERB RED CELERY, 1*s.* per packet.

Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

GRIGOR'S EARLY PROLIFIC POTATO.—The Subscribers beg to offer this superior POTATO for Seed, at 20*s.* per sack, containing 4 bushels, free on board. It is the best early variety known in Morayshire. It is of a middle size, round, white, very productive, and generally mealy at all seasons. This is the variety which was introduced into the eastern counties a few years since by the late Mr. Grigor, of Norwich. Orders from unknown correspondents to be accompanied with remittances.

JOHN GRIGOR and Co., Nurseries, Forres, N. B.

SUPERB NEW SEEDLING ANTIRRHINUMS.

ROBERT WHIBLEY has much pleasure in offering the following superb new ANTIRRHINUMS, which will be ready by the first week of May, as being very distinct, and far superior to any yet offered; and begs to refer to Professor LINDLEY'S report in this Paper, August 13, 1849.

"R. W. *A nice collection, all of them displaying, more or less, a yellow centre;* 1, 2, 5, 6, 11, *and* 12 *are pretty mottled kinds, particularly* 1; 3, 4, *and* 9 *are good light spotted sorts, some of them very good in shape;* 7 *and* 8 *are bright self coloured varieties, particularly* 8, *with its large yellow centre.*" Again, Sept. 8: "32, *striped and dotted with purple, on a pale rosy ground, centre yellow; a nice variety, but hardly distinct enough;* 33 *and* 31 *have more yellow in the centre, and higher colours, particularly* 31, *which has a tinge of yellow all over the ground colour, are very nice varieties.*"

The whole of them are very dwarf and compact, scarcely exceeding 12 inches in height, and throwing out numerous laterals, on which they bloom freely, and are well adapted for bedding or pot culture, being as showy in a bed as the scarlet Geranium or Verbena, and last as long in bloom, while they possess the quality of being kept through the winter without protection from glass; a mat supported on stakes is ample covering during severe weather

1. LOVELINESS (WHIBLEY).—Large bold flower, fine yellow centre, upper and lower lips splashed and studded bright purple, tube striped crimson; a fine variety. 3*s.* 6*d.*

2. DELIGHT (WHIBLEY).—Upper lip splashed violet, lower lip striped and spotted deep crimson, tube spotted violet; distinct and novel; good yellow centre. 3*s.* 6*d.*

3. SATISFACTION (WHIBLEY).—A fine large bold flower, very fine yellow centre, spotted violet on a light ground; distinct. 3*s.* 6*d.*

4. FORGET-ME-NOT (WHIBLEY).—An excellent flower, fine shape, large yellow centre, and distinct; splashed with purple on a light ground. 3*s.* 6*d.*

5. BELLE OF THE VILLAGE (WHIBLEY).—Upper and lower lips spotted light carmine, tube striped violet; large and fine. 3*s.* 6*d.*

6. ADMIRATION (WHIBLEY).—Fine and showy; full, circular, bright yellow centre, splashed and spotted with violet purple. 3*s.* 6*d.*

7. BLACK EAGLE (WHIBLEY).—A fine self, colour a deep crimson scarlet shaded black, good yellow eye; the darkest Antirrhinum known, foliage quite distinct from any yet in cultivation, and the flower stems part green and part a black purple. 5*s.* 6*d.*

8. WHIBLEY'S No. 1.—A superb variety, a bright crimson self, large size, and good shape; fine golden yellow centre, of extra size; one of the finest and most distinct Antirrhinums ever offered. 5*s* 6*d.*

9. SUPERB (WHIBLEY).—A fine shaped flower, good bright circular yellow centre, upper lip spotted violet on a yellow ground, lower lip splashed crimson. 3*s.* 6*d.*

11. BEAUTY (WHIBLEY).—A pretty mottled flower, of good shape, fine full centre, studded and splashed with light purple. 3*s.* 6*d.*

12. GRANDISSIMA (WHIBLEY).—A fine large bold flower, full bright centre of a deep yellow, upper lip dotted light violet purple, lower lip striped deep purple. 3*s.* 6*d.*

31. ATTRACTION (WHIBLEY).—Fine shaped bold flower; good showy yellow centre, splashed and dotted bright purple upon a straw-coloured ground. 3*s.* 6*d.*

33. CAPTIVATION (WHIBLEY).—A large and distinct flower; full, circular, yellow centre, striped and spotted bright purple crimson. 3*s.* 6*d.*

The set of 13 for 39*s.*; and when three sets are ordered, four will be sent.

As R. W. has already received many orders, it will be as well for those who intend honouring him with their commands for the above, to let him know as soon as convenient, so as to ensure a supply. They can safely be sent by post. This description will not be repeated. His general Catalogue will shortly be ready, when all his customers will receive a copy free of expense.—Chester Nursery, Kennington, London.

THE REAL ORIGIN OF THE CAMELLIA ARCHIDUCHESSA AUGUSTA.

There appeared in "La Flore des Serres et des Jardins de l'Europe," for July, 1849, pp. 488, 486, the following startling paragraph from the pen of M. L. Van Houtte, the editor: "I experience the double satisfaction of being able to announce to the readers of the 'Flore' a MAGNIFICENT NOVELTY, and to re-establish its reputation, which has been unjustly damaged in the eyes of some persons." We should have been happy to have joined in applauding the above announcement, instead of being compelled to attack it, if the editor had not endeavoured to throw suspicion both on the truth of facts stated by us and on our honesty. To continue the quotation: "Under this same name there has found its way into the market a very inferior whole-coloured variety, which has been imposed upon the public either by gross negligence or the most unjustifiable intention." And in his Catalogue for 1847, 1848, p. 25, No. 31, M. L. Van Houtte adds, "ARCHIDUCHESSA AUGUSTA, *Gaeto. di Vzo. Corsi*, superb Camellia, imbricated, of a beautiful red colour. (MM. B. and G. are wrong in calling it the same as C. Pecchioliana, which is a totally different thing, and which they themselves have named Contessa Nencini, as every florist can testify)."

Your readers will shortly see to whom "gross negligence or the most unjustifiable intention" is most attributable.

As early as the year 1844 we obtained several layered plants of the variety called Puccini, and after a careful cultivation, and a most conscientious examination of the flowers obtained from our variety, we thought it our duty to inform the public, which we did by stating in French, in our Catalogue for 1846, that "we cannot find the least difference, either in form or in colour, between it and the new variety ARCHIDUCHESSA AUGUSTA of Piccioli and Corsi." The true Archiduchessa augusta, which is brought forward by M. L. Van Houtte, with so much parade as something "*superb among the superb, quite out of the common way, and for which he predicts the most lasting success,*" was not obtained from seed by M. Gaetano di Vicenzo Corsi, as the learned editor has it; and we challenge him to disprove the following account of his pet the Archiduchessa Augusta.

In February 1845, Mr. Joseph Piccioli, of this town, the *original producer* of the plant under discussion, saw its flowers for the first time. He immediately offered it to us for 16*l.*; we refused the offer, simply because we had, the *year before*, brought out our own variety Puccini, which we ascertained to be exactly the same thing. Not finding a purchaser, M. Jos. Piccioli handed it over to M. Vicenzo Corsi, who had an account against him. The latter gentleman offered it to M. L. Van Houtte, who purchased it at a price considerably higher than that at which it was at first offered to us.

The artist who drew the plant copied it most admirably, and by way of precaution M. Corsi prevailed upon the amateurs whose names are given below to sign the drawing. The names were those of M. Jos. Piccioli (the original owner), Professor Commander Betti, M. César Franchetti, and M. Charles Luzzatti.

When the plant was sent to M. Van Houtte it was about 4 feet high, well branched, very healthy, and with several flower-buds, which expanded on its arrival in Ghent. The flower, as described by M. Van Houtte himself (No. 31 of his Catalogue for 1847, 1848), is of a beautiful purple red colour, imbricated, without white or green streaks, and with no violet. During the five years that the plant has been before the public in Florence, its flowers have never differed from the drawing which accompanied it into Belgium, and which was signed as above stated. It was then with no little surprise and anger that the exaggerated and disfigured drawing given by M. L. Van Houtte in the "Flore" for July, 1849, was viewed; more especially as the letters sent for a space of two years by M. Van Houtte to M. Vicenzo Corsi, who was equally interested in the matter, are altogether contradictory, inasmuch as the plant had never produced with him, any more than at Florence, flowers differing from the drawing sent. So strange a variation, not to say so monstrous a change, can only be attributed to degeneracy provoked by an excess of heat; the same thing happens to many other varieties when too much forced to flower. We ask any conscientious horticulturist whether that blue and greyish white mixed with green is a natural and constant effect? And whether that regularity of the spots does not denote the suppleness of pencil which allows itself to be directed by that rare virtue which M. Van Houtte is pleased to qualify with disinterestedness?

In order to conceal his defeat from his readers, M. Van Houtte insinuates in his catalogue, No. 31, that we are mistaken, and that we have supposed the Archiduchessa Augusta to be synonymous with the Camellia Contessa Nencini, which was brought into commerce by us in 1844. Had we not taken care to characterise this variety, which is white, imbricated, with translucent petals, streaked and dotted with rose; had we not repeated this in our own supplement of 1848-49, p. 10, we should have looked upon the above statement as a piece of vain puerility; but the repeated and unmeasured attacks of our adversary too plainly show an intention to raise the price of his Archiduchessa Augusta at the expense of the public, and to attribute to ourselves, who have done all we could to prevent mistake, his own unjustifiable plans; *suum cuique!—Burnier and Grilli.*

We take this opportunity of informing the readers of the *Chronicle* that, having ascertained that the varieties of Camellia Evelina centifolia, Florensa, brought into the market by us in the winter of 1848-9, do not correspond with the drawing, we shall be happy to return to those who received specimens from us the sums of money respectively paid by them as soon as they make application to us to that effect. The accident arose in the following way: On the 19th May, 1846, the Countess Nencini, of this town, by M. Jean Freppa, offered us the two varieties of Camellia in question, accompanied by drawings and six other plants, for the price of 2500 Florence lires. A long illness, which confined Mr. Burnier to his bed, prevented him from himself seeing the flowers of the new varieties obtained from the Countess. As soon as we became the purchasers, we, acting in perfect good faith, set to work to propagate the plants, which, deprived of their branches for the purpose of multiplication, did not flower soon enough to enable us to correct the mistake. The truth of the above statement is proved by the legal proceedings instituted by us, and which were compromised by the seller repaying the purchase money, and also by the statement signed Jean Freppa, and dated 12th May, 1849.

We also beg to inform the readers of the *Gardeners' Chronicle* that our new general Catalogue, considerably enlarged, especially as regards new Camellias obtained in Italy, will shortly appear, and will be sent to any one who will favour us with his address.

In the course of the last few years we have supplied the trade with more than 80 varieties of new Camellias, as our current prices show; and we have before begged those who received them to be kind enough to state in their own catalogues whence they obtained them, in order to prevent any mistake or complaint from amateurs who might obtain them from other sources and under other names. We are sorry to say, however, that our request has not been complied with, as we find scarcely more than a dozen of these varieties mentioned in the catalogues, the others often appearing as other varieties, and under other names.

BURNIER AND GRILLI.

HORTICULTURAL AND METEOROLOGICAL OBSERVATIONS
MADE BY MM. BURNIER AND GRILLI, AT THEIR AGRICULTURAL AND BOTANICAL ESTABLISHMENT AT FLORENCE.

The subjoined table of the extraordinary temperature of the atmosphere which we have had lately may prove interesting to your readers, and useful in a scientific point of view. The temperature has never been known to be so low nor so disastrous in its effects as at present; an idea of the mischief thus caused may be conveyed to the reader by the following notes.

I. *Plants in the open air exposed to the South, and killed by the frost.*

Olive trees of the plains.
Orange trees ,,
Citron trees ,,
Evergreen Oaks and Cork trees.
Fig trees and Japan Medlars.
Prunus lauro-cerasus
Laurus borbonia
,, indica
,, camphora
,, glauca
,, nobilis
Arbutus unedo
Magnolia grandiflora partly, and fuscata
Nerium splendens and others
Pistacia vera
Pittosporum lineare
Chamærops humilis
Phœnix dactylifera
Metrosideros, all the varieties
Benthamia fragifera
Rhamnus alaternus and variegatus
Rhododendron arboreum and its varieties
Raphiolepis indica
Siphocampylus, all the vars.
Solanum jasminifolium
Viburnum japonicum
,, sinense
,, Tinus
Araucaria imbricata
,, Brasiliensis
,, Cunninghamii
,, excelsa
Pinus canariensis
,, longifolia

N.B. Owing to differences of aspect, there may be a few exceptions to the above general statement. At all events these plants have been in the open ground for periods of from 10 to 90 years and more.

II. *Plants in the open air, exposed to the North, and which have not suffered by the frost.*

5000 Camellias, comprising 500 of the most renowned varieties and of different strength. Of this large number not more than 11 have been killed outright—not to mention some trifling damage to other varieties, and which we do not reckon as anything.

2000 Rhododendrons, comprising 250 distinct varieties.

R. arboreum and others of different strength, except R. cinnamomeum and its varieties, which have suffered materially.

Of 2000 specimens of 100 varieties of Azalea indica, a few points and leaves are all that have suffered.

1000 Araucaria imbricata and Brasiliensis; 10 species of Podocarpus, a collection of Juniperus, of Taxus, of Thuja, Cryptomeria, Taxodium sempervirens.

500 Magnolia grandiflora, the collection, fuscata, &c.

500 Myrsine africana, the points only injured.

Olea fragrans, Illicium anisatum, religiosum, Cleyera japonica, Gardenia grandiflora and radicans.

Enkianthus, Viburnum japonicum and sinense, Euonymus fimbriatus, Escallonia, Cotoneaster, Cratægus, Ligustrum japonicum.

Daubentonia, as well as other more delicate plants, which were preserved by the snow from the effects of the greatest cold (15° R.)

Daubentonia tripetiana
Escallonia floribunda and rubva
Erythrina Crista-galli and laurifolia
Euonymus fimbriatus
Franciscea, all the varieties
Gardenia florida and radicans
Habrothamnus, all the vars.
Haloragis capensis
Halleria lucida
Houstonia coccinea
Indigofera australis
Inga pulcherrima
Jochroma tubulosa
Kennedya bimaculata
Malvia Tweediana
Myrica pennsylvanica
Myrtus tarentina
,, romana
,, bætica
,, tenuifolia
Olea fragrans
Poinciana Gilliesii
Quercus chrysophylla
,, confertifolia
,, Fordii
,, Ghiesbreghtii
,, glabra
,, insignis
,, phullata
,, rugosa
,, species, Mexico

N.B.—The above plants are grown without any shelter in a border at the north of the town wall, which serves as a boundary, and is about 500 yards long and 8 yards high, where they are directly exposed to the North wind, as well as to the greatest cold, and where they get no sun from the 15th of Nov. to the 15th of March, and do not experience those changes of temperature to which all the other plants are exposed.

Meteorological Observations made at the Agricultural and Botanical Establishment of MM. Burnier and Grilli, situate 90 feet above the level of the sea. The degrees are those of Réaumur's* thermometer, which was exposed to the North, under the town wall, 25 ft. high, fixed to a Camellia.

* To convert any given degree of Réaumur's thermometer to the corresponding degree on Fahrenheit's scale, multiply the given degree of Réaumur by 9, divide the product by 4, and add 32 to the quotient; the result will be the corresponding degree of Fahrenheit's thermometer.

Observations of Father Inghirami, at the Observatory of Ximaiano, at Florence, 250 feet above the level of the sea. Réaumur's thermometer, surrounded by walls.

AMERICAN PLANTS.

GEORGE BAKER begs to inform the gentry and public he has published a NEW CATALOGUE of his AMERICAN AND CONIFEROUS PLANTS, &c., which may be had on application.—Windlesham Nursery, Bagshot, Surrey.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to William Mitchell, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes ...	8*s.*	Early Manleys	7*s.*
*Early Round Frame ...	8*s.*	Early Cockneys	7*s.*
Early Ash-leaved Kidney	8*s.*	Fox's Seedling	7*s.*
Second Early Potatoes for Winter and Spring use:			
American Native Potatoes	5*s.*	Kentish Pink Kidney ...	4*s.*
York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receip of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

SPLENDID NEW DIANTHUS.

J. REID begs to inform the Public that he has succeeded in saving a small quantity of his new DIANTHUS REIDII. The ground colour is bright scarlet, laced with white, the truss or head of bloom is larger than a Dahlia flower; its dwarf habit is suitable for any situation. By sending 12 Postage stamps to J. Reid, Mount Scilla Nursery, near Chippenham, Wilts, in return a packet of seed will be sent.

SLATE WORKS, ISLEWORTH.—The following articles, manufactured in Slate for Horticultural purposes by Edward Beck, may be seen in use at Worton Cottage, upon application to the Gardener, Sundays excepted. Orange Tubs, Plant Boxes, Tanks, Cisterns, Shelves, Garden Bath Edging, Hot Water Tank Covers, Flower-beds for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c.

Estimates given for Work as shown upon Drawings and in Specifications. A large stock of Slate Slabs, of all size and thicknesses, kept on sale.

PEAS.—Dr. Lindley, in the Leading Article of this Paper, Feb. 2d, says, "For ourselves we should be perfectly satisfied with the following half-dozen sorts of Peas."

PRINCE ALBERT	BEDMAN'S IMPERIAL
BISHOP'S NEW LONG-POD	FAIRBEARD'S CHAMPION OF ENGLAND.
KNIGHT'S TALL MARROW	
AUVERGNE	

WILLIAM E. RENDLE and Co., Plymouth, will supply TWO QUARTS of each of the above for 10s., or ONE QUART of each for 6s. 6d., carriage free to any station on the Great Western, Bristol and Exeter, or South Devon Railways, on receipt of Post-office order.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

THE BEST SIX SORTS OF PEAS,
SO STRONGLY RECOMMENDED BY THE EDITOR OF THE "GARDENERS' CHRONICLE" ON SATURDAY LAST, AT PAGE 67.

JOHN SUTTON and SONS having a large stock of these excellent PEAS, will supply them at the annexed prices:

	s.	d.
PRINCE ALBERT ... ... per gallon	2	6
AUVERGNE ... ... ,,	2	6
BISHOP'S NEW LONG-PODDED ... ,,	5	0
BEDMAN'S IMPERIAL ... ... ,,	2	0
KNIGHT'S TALL MARROW ... ,,	3	0
FAIRBEARD'S CHAMPION OF ENGLAND ,,	3	0

All other kinds of Peas and Seeds may be had at proportionately low prices, as see SUTTON'S PRICED LIST, which will be sent, gratis, on receipt of one penny stamp for postage.

Sutton's superb Cos Lettuce, 1s. per packet.
Reading Seed Warehouse, Reading, Berks.

RANUNCULUSES, ANEMONES, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London, by appointment Florist to her Majesty the Queen, and to his Majesty the King of Saxony, begs to recommend the present season as well fitted for planting the above bulbs, which he can supply at moderate prices, having a very extensive stock. His Catalogue may be had on application.

SEEDS, &c.

WM. DENYER, Seedsman and Florist, 82, Gracechurch-street, London, begs most respectfully to inform his Friends and the Public that his new Descriptive and Priced CATALOGUE of SEEDS, &c., is now ready, in which will be found all that is new, rare, and useful. Copies of the same may be had on application.

W. D. has just received a fresh supply of the following (strong flowering roots), at reduced prices:

Lilium lancifolium rubrum	2s.	6d.	each.
Gladiolus gandavensis, 6d. each, or ...	5	0	per doz.
,, floribundus superbus	1	0	per doz.
,, natalensis	1	0	per doz.

MYATT'S LINNÆUS RHUBARB.

J. MYATT and SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1s. 6d.; ditto, Mitchell's Royal Albert, 1s. 6d.; Victoria, 9d. The usual Trade allowance.—Post-office orders are requested to be made payable to Joseph Myatt, Manor Farm, Deptford.—Feb. 9.

ORANGE, LEMON, LIME, CITRON, AND SHADDOCK TREES.—The first importation of the above Trees, in most excellent and healthy condition, has arrived from Italy. They are from 2 to 4 feet high in the stems, very straight, and possess strong grafts, and will make splendid trees in two or three years; from 12s. to 25s. each. They may be seen at A. Cobbett's Italian and Foreign Warehouse, 18, Pall-mall, London. Also Catalonian, Azorian, and Arabian Jessamine Plants. The Double Italian Tuberose Roots are still on sale, 4s. per dozen.

WM. HAMILTON, Seedsman, &c., 156, CHEAPSIDE, LONDON, will forward free by post, on receipt of 5s. 6d., 25 varieties of the most beautiful Hardy ANNUALS, with the SCIENTIFIC AND ENGLISH NAME, TIME OF SOWING AND FLOWERING, MODE OF CULTURE, &c., printed on each packet; 12 varieties, free by post, 3s.

VEGETABLE and other SEEDS of every description, including all the new Peas and other Seeds of the season.

W. H.'s DESCRIPTIVE CATALOGUE will be forwarded on receipt of two postage stamps.—156, Cheapside, London.

UNIVERSAL CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, CHRYSANTHEMUMS, PETUNIAS, &c.

G. SMITH'S Priced and Descriptive Catalogue contains the very best selections of the above; with a useful note and a marked List of the best Verbenas for exhibition in pots, with mode of training, and what is of great importance to exhibitors, the time of stopping back, so as to catch a sheet of bloom when it may be required; with descriptions of his superb Seedling Fuchsias, Verbenas, Petunias, &c.; and will be forwarded on the receipt of one postage stamp.—Tollington Nursery, Hornsey, Islington.

BECK'S PELARGONIUMS, and other raisers' Flowers.—Now ready for selection and going out. Twelve of the following varieties, including box and carriage to London, will be forwarded in exchange for post-office order on Brentford for Two Guineas. They are well-rooted in 3-inch pots, and ready for an immediate shift into a larger size:

Blanche, Centurion, Cracker, Forget-me-not, Ariel, Cassandra, Cruenta, Gustavus, Gulielma, Grandiflora, Junii, Negress, Rosamond, Sundown. Or Nine of the above, and Hoyle's Crusader, or Foster's Victory.

Edward Beck, Worton Cottage, Isleworth.

FISHER, HOLMES, and CO., Nurserymen and Seedsmen, Sheffield, beg to offer the following CHOICE CUCUMBERS and MELONS, which they can confidently recommend, being such as cannot be surpassed. Sent free by post.

CUCUMBERS.

BATLEY'S TELEGRAPH.—Light green, fine form, very prolific, 20 to 28 inches. 6 seeds, 2s.; 12 ditto, 3s. 6d.
COPPACK'S HYBRID.—Dark green, extra fine form, very superior. 6 seeds, 3s.; 12 ditto, 5s.
CONTENDER.—Dark green, large, and very prolific. 6 seeds, 1s.; 12 ditto, 1s. 6d.
LANCASHIRE WITCH. — A great improvement in every respect on the Sion House. 6 seeds, 1s.; 12 ditto, 1s. 6d.
LARRISY'S ST. CATHARINE.—Very handsome and superior, 24 to 28 inches. 6 seeds, 2s.; 12 ditto, 3s. 6d.
READ'S SUPERB.—Fine for early forcing, great length, and very prolific. 6 seeds, 1s.; 12 ditto, 1s. 6d.
SION HOUSE (true).—12 seeds, 1s.
VICTORY OF BATH.—12 seeds, 6d.

MELONS.

FLEMING'S TRENTHAM HYBRID.—6 seeds, 1s.; 12 ditto, 1s. 6d.
BEECHWOOD (true).—12 seeds, 1s.
NEMOPHILA MACULATA, 3d., 6d., and 1s. per packet.

A remittance either by post-office order or in postage stamps. The Trade supplied. Separate Catalogues of Garden, Flower, and Agricultural Seeds; Garden Implements, &c.; also Trees, Shrubs, &c., may be had free on application.

GENUINE HOME-GROWN SEEDS FOR THE KITCHEN GARDEN, may be had of the Subscriber, in collections of 12s. 6d., 1l., 2l., and 3l. worth, containing the most approved varieties in cultivation. Also for the Flower Garden, in selections of 25 kinds for 6s., 50 for 10s., 100 for 18s. packed in Ayres and Moore's new labels, with directions for culture, time of flowering, whence introduced, &c.—William Masters, F.H.S., Exotic Nursery, Canterbury.

W. M.'s New Catalogue may be procured on pre-paid application. Orders amounting to 2l. and upwards delivered to any station on the South-Eastern Railway.

SAMUEL FINNEY and CO.'S NEW CATALOGUE OF SEEDS is now ready, and will be forwarded gratis on the receipt of two penny stamps for postage. In forming our Collections of Seeds we have taken special care to include all the select and most approved kinds, and such as we can confidently recommend.

Of VEGETABLE SEEDS, our Collections contain a full supply of all that is requisite for the largest establishment, and the kinds and quantities for each collection are stated. No. 1, 2l. 10s.; No. 2, 1l. 10s.; No. 3, 1l.; and No. 4, 12s 6d.

Of FLOWER SEEDS, we have included all the most choice and showy kinds, particularly those we know to succeed well in the north, and a full list of all the best kinds of German Seeds, imported direct in sealed packets, with prices.

A Collection of 100 packets of the best hardy and half-hardy kinds for	15s.	0d.				
Ditto	of 50	ditto	ditto	ditto ...	8	0
Ditto	of 25	ditto	ditto	ditto ...	5	0

We particularly recommend this Catalogue to residents in the north, as they will be enabled to purchase to advantage. All orders delivered free of carriage at any of the railway stations between Newcastle and York, Berwick and Carlisle, and by steam-boat to London, Hull, Whitby, Leith, Dundee, and Aberdeen. Railway and water communication to all parts of the kingdom.

Samuel Finney and Co., Gateshead, near Newcastle-on-Tyne.

CHOICE FRUITS.

YOUELL and CO. beg to call the attention of those gentlemen now about planting or replenishing their Fruit and Kitchen Gardens to the following choice articles:

TRUE FASTOLFF RASPBERRY.

Y. and Co. beg to announce they are now executing orders for the above in fine strong Canes of the same stock as they had the honour of supplying Her Majesty's Gardens and most of the Nobility. 15s. per 100.

Fine large WHITE RASPBERRY, 3s. per dozen.
CORNWELL'S VICTORIA DITTO, 12s. 6d. per 100.
PEACHES, NECTARINES, AND APRICOTS, 3 years trained, and forward for bearing, 5s. each.
CHERRIES AND PLUMS, 3 years trained, 3s. 6d. each.
PEARS AND APPLES, fine Espalier, 24s. per dozen.
The above are of the most select kinds, and worked from the Stock of the Horticultural Society of London, and are warranted correct to their sorts.
STURMER AND ANGLESEA PIPPIN, fine Espalier, 24s. per dozen; Standards, 1s. 6d.; Dwarfs 1s. each.
GOOSEBERRIES, in 12 of the best kinds selected for size and flavour, 5s. per dozen.
CURRANTS, improved large White Dutch, 5s. per dozen.
DITTO, Black Naples, 5s. per dozen.
DITTO, large Red Grape, 4s. per dozen.
STRAWBERRIES. — Myatt's Eleanor, 10s. 6d.; Globe, 7s. 6d.; Pine Apple, 5s.; Prolific, 5s; Mammoth, 7s. 6d.; British Queen, 3s. 6d.; Cuthill's Black Prince, 10s 6d.; Coul Late Scarlet, 3s. 6d. per 100, with many other fine sorts.
RHUBARB.—Myatt's Linnæus, 2s.; Mitchell's Prince Albert, 2s.; Myatt's Victoria, 1s. each. Tobolsk (earliest), 9s. to 12s. per dozen.
ASPARAGUS.—Giant (strong), 2 and 3 years, 2s. 6d. and 3s. 6d. per 100.
SEAKALE (strong), 1s. 6d. per dozen.
ROSES, Standards and Half-standards, of the very best sorts in cultivation, 12s. to 15s. per dozen.
WHITETHORN, 3 years old, very fine and clean, 2s. 6d. per 1000.
CATALOGUES of their extensive and select collection of CARNATIONS, PICOTEES, PINKS, and PANSIES, may be had on application.
Post-office orders are respectfully requested from unknown correspondents.—Nursery, Great Yarmouth.

Among the more important facts which recent chemistry has demonstrated is, that plants naturally derive the ammonia which is so necessary to them from the atmosphere. Thrown into the air in the form of a carbonate, it is immediately dissolved in the vapour eternally present, and when that vapour is precipitated as rain it is conveyed to the earth and to all the foliage that intercepts it. Absorbed by the leaves, sucked up by the roots, it adds intensity to the green colour and vigour to all the powers of vegetation. How it acts is immaterial; that it does act, and with admirable effect, is now undoubted.

"The nitrogen of putrefied animals," says Prof. Liebig, "is contained in the atmosphere as ammonia, in the state of a gas which is capable of entering into combination with carbonic acid, and of forming a volatile salt. Ammonia in its gaseous form, as well as all its volatile compounds, is of extreme solubility in water. Ammonia, therefore, cannot remain long in the atmosphere, as every shower of rain must effect its condensation, and convey it to the surface of the earth. Hence, also, rain-water must at all times contain ammonia, though not always in equal quantity. It must contain more in summer than in spring or in winter, because the intervals of time between the showers are in summer greater; and when several wet days occur, the rain of the first must contain more of it than that of the second. The rain of a thunderstorm, after a long-protracted drought, ought, for this reason, to contain the greatest quantity conveyed to the earth at one time."

This was Liebig's first discovery of importance in agricultural chemistry; and it formed one of the most valuable facts in the earlier editions of his well-known work. That ammonia is necessary to plants had been long previously shown by Davy; it was its atmospheric origin in part that the Giessen philosopher pointed out; and thus a new light was thrown upon the refreshing and invigorating effect of heavy rains, which act, not merely by their water, as once was thought, but also by the carbonate of ammonia which they bring down.

So far as agriculture is concerned this is, however, a truth devoid of possible application, because the volatile carbonate cannot be advantageously used, artificially, through the agency of the atmosphere. The farmer who should throw a cloud of carbonate of ammonia into the air of his occupation, would get little of it back again for his own profit. But it is otherwise with gardeners, who have to create an artificial atmosphere in a confined space. It is not a little remarkable, then, that so simple an agent, so easily procured, and applicable with so little trouble, should have scarcely ever been employed in hothouses—at least in the proper manner. Where it has been used it has been almost invariably when dissolved in water, and applied with a syringe. It was thus that nitrate of ammonia, disguised under the name of Humphrey's Compound, was used: and, as was to be expected, with no such effect as was anticipated.

It should be remembered that carbonate of ammonia is generally dispersed through the atmosphere, in which it is suspended, dissolved in invisible vapour. In this state it is incessantly in contact with every part of the foliage. When rain falls, the ammonia disappears for the moment, passing downwards in the rain-drops to the ground, and thence arriving at the roots of plants. But if it is in gardens first dissolved in water, and then thrown upon plants with a syringe, natural conditions are by no means imitated. It reaches no part except that on which the water falls, half the upper surface and nearly all the under surface of the foliage is missed, and it is scarcely detained even upon the parts which the water actually touches.

The proper course is to throw it into the air in the form of gas. This is easily effected in the following manner. When a greenhouse or hothouse is shut up, warm and damp, rub upon the heated pipes, the flues, or a hot piece of metal, a small piece of carbonate of ammonia *with some water* (not dry); the peculiar smell of smelling salts will be instantly perceived, and if this is done at the two ends of a house, as well as in the middle, the air will rapidly receive a sufficient charge of the substance. After it has been allowed to remain about the plants for a short time, some gardeners syringe their houses freely; but it is doubtful whether that is the best plan, provided the air of the house is naturally damp. It must be admitted that the effect of this simple application is very remarkable, quickly producing a visible change for the better in the appearance of the plants; *provided they are otherwise well cultivated.*

But caution must be used in the application. A piece of carbonate of ammonia as large as a shilling is sufficient for one charge in a stove 40 feet long.

The quantity of ammonia which the air naturally contains is always very small; less no doubt than plants will greedily absorb. But it warns us that if too much is applied, great damage may be expected; as in truth is found in the shrivelled and dying leaves of plants exposed to too much vapour of this description. Upon this point it may be useful to take another statement from Liebig's book.

"If we suppose that the air saturated with moisture at 59° F. allows all the water which it contains in the gaseous form to fall as rain, then 1 lb. of rain-water must be obtained from every 1132 cubic feet of air. The whole quantity of ammonia contained in the same number of cubic feet will also be returned to the earth in this 1 lb. of rain-water. But if the 1132 cubic feet of air contain a single grain of ammonia, then the few cubic inches usually employed in an analysis—must contain only 0.0000048 of a grain. This extremely small proportion is absolutely inappreciable by the most delicate and best eudiometer; it might be classed among the errors of observation, even were its quantity ten thousand times greater. But the detection of ammonia must be much more easy when a pound of rain-water is examined, for this contains all the gas that was diffused through 1132 cubic feet of air."

. . . "Experiments made in this laboratory

(Giessen), with the greatest care and exactness, have placed the presence of ammonia in rain-water beyond all doubt. It has hitherto escaped observation, because it was not searched for. All the rain-water employed in this inquiry was collected 600 paces south-west of Giessen, whilst the wind was blowing in the direction of the town. When several hundred pounds of it were distilled in a copper still, and the first 2 lbs. or 3 lbs. evaporated with the addition of a little muriatic acid, a very distinct crystallisation of sal-ammoniac was obtained; the crystals had always a brown or yellow colour."

It must, therefore, be remembered that while the mixture of carbonate of ammonia with the air of hothouses is beyond doubt a most advantageous process, it requires to be conducted with some judgment and caution.

BEANS.

Although many names have been given, it appears that the sorts of Beans are not so numerous as to require distinction in classes.

1. *Early Mazagan*, aliàs Mazagan, Stidolph's New Early, Early Bromley, Early Malta, Early Aldridge, Féve de Mazagan. Stems rather slender, 2 to 4 feet high; pods containing three, seldom more than four Beans. Esteemed the best for early crops, and should be sown in October, November, January, and February.

2. *Marshall's Early Dwarf Prolific*, aliàs Marshall's Prolific; stems 1½ to 2 feet high, branching close to the stem, very prolific—producing, in clusters, pods resembling those of the Mazagan, but contains somewhat larger Beans, and nearly a fortnight earlier.

3. *Long-pod*, aliàs Common Long-pod, Early Long-pod, Large Long-pod, Hang-down Long-pod, Sword Long-pod, Windsor Long-pod, Turkey Long-pod, Moon, Wrench's Early Moon Lisbon, Early Lisbon, Sandwich, Féve à longues cosses. Stems 3 to 4½ feet high, pods long, not very broad, generally containing four Beans, of good quality; being very productive, this sort is generally one of those employed for principal summer crop, especially in cottage gardens. To this is related, *Johnston's Wonderful*, which differs in the pods and Beans being broader and flatter than those of the Long-pod.

4. *Green Long-pod*, aliàs Green Nonpareil, Green Genoa, Féve verte, Féve toujours verte. Stems 3—4½ feet high; pods long, a little flattened, containing generally four rather small oblong Beans, which are much valued by some for their green colour when served up at table, but they require to be gathered when very young, otherwise they lose their fine colour; a good bearer, and, in point of earliness, succeeds the Long-pod.

5. *Dutch Long-pod*. Stems 3—4½ feet high; pods long and broad, containing 4—6 large, broad, white Beans, of good quality; an abundant bearer, later than the Long-pod.

6. *Windsor*, aliàs Broad Windsor, Kentish Windsor, Taylor's Windsor, Taylor's Large Windsor, Taylor's Improved New Windsor, Wrench's Improved Windsor, Mumford, Small Spanish, Féve de Windsor. Stems 3—4 feet high; pods short, but very broad, seldom containing more than two Beans, which are very large, roundish, flattened, and esteemed the best for a summer crop, remaining longer fit for use than any other, with the exception of the following:

7. *Green Windsor*, aliàs Toker, Féve de Windsor verte. Similar to the Windsor, excepting that the Beans retain a green colour after being ripe.

8. *Green China*, or Féve verte de la Chine. Stems about 2½ feet high; pods long, roundish, containing three or four Beans, which remain green even when dry; an abundant bearer, and in some cases may be found useful, on account of its coming in late.

9. *Dwarf Crimson Seeded*, alias Féve très naine rouge, naine rouge. The earliest and dwarfest of all the sorts of Beans; stems scarcely attaining a foot in height, branching close to the ground, and bearing profusely; pods about 3 inches in length, generally well filled; the Beans are crimson, nearly the size of those of the Long-pod. It might be grown in rows from 12 to 15 inches apart.

10. *Dwarf Fan*, aliàs Fan or Bog, Dwarf Cluster or Bog, Féve naine hâtive à châssis. Stems 1½ to 2 feet high; pods small, nearly round, containing seldom more than three small oblong Beans.

White Blossomed, or White Blossomed Long-pod; stems 3—4 feet high; pods long, nearly round, usually containing four Beans, which are somewhat oblong, of a dingy white colour when dry; only a moderate bearer, but is sometimes sown in May and June for the later crops.

Red Blossomed, aliàs Scarlet Blossomed, Purple Blossomed, Early Asper, Féve à fleurs pourpres; stems 3—4 feet high; pods short; Beans generally three in a pod, of a dingy colour when ripe; more ornamental in blossom than useful for fruit.

Dark Red, or Red Windsor. Allied to the Windsor, but differs in the Beans being of a light red colour when young, dark red when ripe; its colour when cooked is objectionable. The *Féve Violette* has similar characteristics.

There may be some varieties besides those above noticed, but they are not sufficiently known. The sorts to which numbers are prefixed are those only considered worthy of cultivation, and in most cases the following will be sufficient:—Early Mazagan, Long-pod, Green Long-pod, Windsor, and Green Windsor. *R. T.*

NOTES OF A TRAVELLER.—No. VIII.

On paying a visit to one of the principal nursery gardens at Fa-tee, near Canton, I was curious to see the process of preparing and packing those seeds which are usually sold to foreigners to be sent home to friends in Europe and America. I had been accustomed to believe, with all good charitable people, that these seeds were boiled or poisoned in some way by the Chinese before they were sold to our merchants, in order that the floral beauties of China should not find their way into other countries, and the trade in seeds be injured.

The Chinese are certainly bad enough, but like other rogues they are sometimes made worse than they really are. "Come Aching," said I to the old man who generally supplied these seeds, and in whose good graces I stood pretty high, from having made him a present of a rare and curious plant, "I want to see your method of packing seeds for foreigners. Take me to your seed-room and show me the whole process from beginning to end." The old man led me up to the middle of his garden, where he had an ornamental shed or seed-room. It was nicely fitted up with shelves, on which were arranged a great number of small porcelain bottles, such as I had often seen in London with seeds from China. "Sit down," said he, "and I will explain the business to you. I first gather the seeds from the plants. I then put each kind, separately, into one of these small bottles, and then pack the whole into a little box ready for being shipped to Europe or America." "I understand that part of the business," said I, "but what is the substance which you put into the bottles along with the seeds?" This was a white ashy-looking matter which we supposed in England might be burnt bones, and some conjectured that it was mixed with the seeds for the purpose of manure. "Burned lice," said Aching. "Burned what?" I asked, with a smile which I could not conceal. He repeated the assertion with all the gravity of a judge. The reader may probably be ignorant of the Chinese language, and I will therefore explain that a Chinese cannot pronounce our letter *r*; he has not such a sound in his language. In trying to pronounce any word in which the letter occurs, he invariably substitutes the sound of *l* for that of *r*. It was, therefore, burned Rice, or the husks of Rice reduced to ashes, which he meant. I then asked him the reason why he used this substance in packing seeds, and he replied in Canton English as follows: "*S'pose my no mixie this seed, worms makie chow-chow he.*" Although the Chinese in Canton would consider this excellent English, it may be as well to explain what his meaning actually was, which was this. "Suppose I did not mix ashes with the seeds, worms would eat them." He alluded to a little maggot which would come out during the voyage. "Don't be angry," said I, "but we English fancy you do something to destroy the vitality of the seeds, instead of endeavouring to preserve it." "I know," said the old man, "you fancy I boil them!"

It is a most difficult matter to preserve the seeds of trees and shrubs in the south of China, owing to the attacks of maggots. This is, without doubt, one of the reasons why Canton seeds so seldom grow when they are received in England, another is the age of the seeds. Old ones, gathered in former years, are generally mixed up with the fresh ones, and are all sent home together. Most assuredly, however, poor Aching does not boil them or poison them in any way. *R. F.*

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

(*Continued from p.* 70.)

Leaving the kitchen-garden in the direction opposite to that by which we entered it, we pass over asphalte walks through the orchard, the walks being edged with common Yew. On leaving the orchard, on each side are splendid Irish Yews, with a cut base of common Yew, and behind are rows of Juniperus excelsa—fine specimens, from 10 to 12 ft. high, and uniform in growth. These are occasionally intermixed with Gold Cedars. The back-ground is clothed with high Pines. At the termination of this a new feature commences. Portugal Laurel scrolls, 18 inches high and 4 feet broad, constitute the margin. These are backed by princely specimens of Deodar, Abies Douglasii, Pinus Cembra, P. insignis, and A. Morinda, the latter loaded with cones. The underground is covered with wild Heath in great variety.

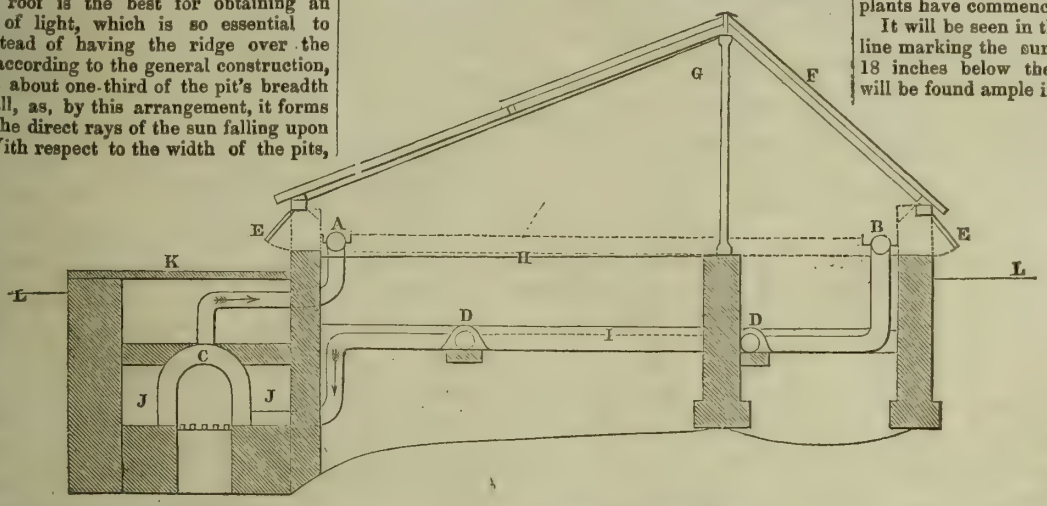
We will now revert to the subject of transplanting large trees from a distance, in order to give this wonderful garden immediate effect. The following list of a few old Yews and Cedars of Lebanon will serve to illustrate the vastness of the undertaking:

No.	Miles brought.		Circumf. of Stem. ft.	in.	Feet high.	
1	4	—	5	4	38	— Diameter of branches 54 feet.
2	3	—	6	5	39	— " " 30 "
3	10	—	7	0	33	— Stem at the time decayed and hollow; now nearly filled with new roots, feeding in decayed trunk.
4	7	—	7	0	17	— Clipped arbour.
5	32	—	5	0	34	— 18 ft. across; about 300 years old.
6	28	—	A clipped column, 22 feet round and 28 feet high.			
7	34	—	7	2	33 feet high, diameter 25 feet.	
8	26	—	13	0	Clipped arbour, 19 feet high; several birds and other figures.	
9	10	—	5	6	19	— Clipped arbour, 27 feet across.
10	33	—	7	6	32	— Stem quite hollow.
11	10	—	7	9	25	— Known to be above 600 years old.

As we measured the above and ascertained their history, we decline enumerating more; but there are hundreds of others of similar dimensions, which were brought a distance of from 4 to 40 miles. Of some Cedars of Lebanon, which had been brought two miles, the stem of one was 4 feet 6 inches in girth and 51 feet high, another was 4 feet in girth and 35 feet high, and a third was 6 feet in girth, 37 feet high, and 48 feet across the branches. These were the dimensions of the latter when transplanted some years ago, but it is now 7 feet 8 inches in girth, and growing vigorously. We are quite within bounds when we state that 10,000 of these large plants have been removed, and that hundreds of thousands, of smaller dimensions moved, are greatly in advance of those found generally in nurseries.

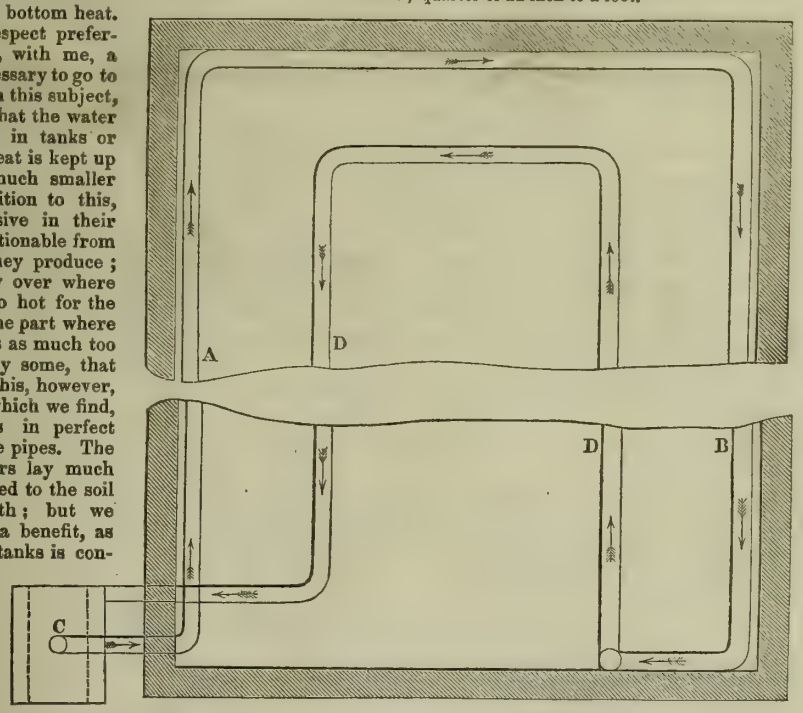
The removing of large trees, therefore, formed an important consideration in the formation of the gardens at Elvaston, immediate effect constituting, as it did, a prominent feature in all the proceedings. These operations do not appear, however, to have been attended with much risk or difficulty. The size of the subject to be moved or the distance from whence it was to come never deterred nor influenced for a moment the completion of the design. Gigantic trees, which would have made a stout-hearted improver shudder to attack, in order to transpose them even a few yards, considering the risk and magnitude of the undertaking, appear to have been thought lightly of at Elvaston. Indeed, Mr. Barron informed us that, during the last 18 years, they have been in the habit of moving large trees, *at all seasons, and without any previous preparation*, with nearly uniform success. This has been with them more a matter of necessity than choice; much, of course, depended upon the kind of tree to be removed, and the facilities for removing it. As a general rule Mr. Barron does not consider it prudent to move deciduous trees when they are in leaf, unless the facilities for the work are great, and the case urgent. Under such circumstances it can be done; an Elm tree was pointed out to us upwards of 40 feet high, and the bole nearly 5 feet in circumference, which was transplanted on the 27th of May, when it was in full leaf, without sustaining any apparent check. Mr. Barron's practice and opinion in regard to transplanting large evergreen trees, may appear paradoxical, because they are opposed to the general rule, and in direct opposition to the opinions almost universally entertained on this important operation. He considers that large Hollies, Cedars of Lebanon, all the Fir tribe, and Yews, may be moved at any time. The weather being favourable, and other circumstances suitable, they will do best if transplanted when their juices are thinnest, or when they are in the *most active state of growth*. This is certainly a startling statement, when compared with general practice; but his reasons, which are founded upon experience, are these: the water, when applied to the roots, is quickly absorbed, and soon ascends to the leaves, where it immediately becomes available in the promotion of growth. Whenever plants are removed at a period when their juices are not in active circulation, the ends of the lacerated roots, being surrounded sometimes with too much moisture for months, rot before relief can be obtained; the check is consequently much more severe in the latter than in the former case. This season of conducting the operations of transplanting at Elvaston was in a great measure forced upon them. Ground had been prepared, and there existed urgent reasons for immediately completing the work. They could not stop the operations until what had been laid down by Sir Henry Stewart and others, as the proper season for them, had arrived, or until nicely prepared trees could be procured. They had, therefore, to strike out a course for themselves, which terminated in a system which was at first based upon the simple idea that if a plant could be successfully moved with an undisturbed mass of earth sufficiently large, they need not then wait for particular seasons, or trees which had undergone previous preparation. The result showed ample evidence that the basis laid down was a solid one. The next difficulty was merely a mechanical problem, which was soon solved. A platform of planks was formed under the tree to be removed, the whole resting on two central poles; this done, the carriage (which was constructed with six wheels and two strongly trussed beams, the ends of which rest in the bolster of each axle, and so arranged as to be easily taken to pieces (the axles being 19 feet apart), was placed one beam on each side of the tree. The entire mass was then raised, by means of a principal screw, and suspended in strong chains under the beams. Thus placed, except in high winds or very rough roads, the load will ride without a gye rope. All the trees at Elvaston have been carried upright, the same as they grew; and in this way a Lombardy Poplar, above 70 feet high, weighing with the ball more than 12 tons, was carried a great distance. For the moving of smaller trees, a three-wheeled machine with a roller at each end, and having a lever for raising and lowering the plants (which can be done in five minutes when ready), is found useful. Both these machines are in constant requisition at Elvaston, during summer and winter. *R.G.*

(*To be continued.*)



ON THE CULTIVATION OF THE PINE-APPLE AT TRENTHAM.

In compliance with the request of "A Pine Grower," I beg to forward you a brief description of my practice in the culture of Pine-apples, along with a plan and section of our pits for growing them on the Meudon plan, the bottom-heat being supplied by pipes instead of tanks.



In constructing the pits, the principles to be kept in view are the following:—Abundance of light, to be obtained by a span roof, glazed with long panes; ample means of supplying top and bottom heat, with perfect control over such means, which is most easily and economically effected by returning the pipes which supply the top heat beneath the bed, thus causing them to

produce bottom-heat also. To these we have only to add abundant provision for ventilation.

In the cultivation of this fruit, the most important principle to be kept in view is the careful imitation of the natural climate of the West Indian Islands. We should supply them with a steady heat to their roots, and with a hot moist atmosphere, tempered with abundant ventilation, so as to resemble their native sea breezes; shielding them from the excessive heat of the sun by a thin light awning, as they are in their natural habitats by the light clouds which float through the sky during the hottest part of the day. When the sun is not excessively hot they should have all the light that can be afforded them. With regard to soil, use an enriched maiden loam and turfy peat, in the proportion of two-thirds of the former to one of the latter. When we first commenced growing them out of pots, we tried them in sandy peat, according to the method practised at Meudon, but owing, I suppose, to a difference in the quality of the soil, our success did not answer our expectations; and we find that by using a larger proportion of loam we obtain better swelled fruits from smaller plants. Care must be taken to plant them so far apart as to allow the leaves of each plant to take their natural curvature, and thus to expose the greatest amount of their surface to the direct influence of the sun's rays. The span-shaped roof is the best for obtaining an abundant supply of light, which is so essential to success; but instead of having the ridge over the centre of the pit, according to the general construction, I prefer placing it about one-third of the pit's breadth from the back wall, as, by this arrangement, it forms no obstruction to the direct rays of the sun falling upon all the plants. With respect to the width of the pits, ours are like that shown in the section; but it would be no disadvantage to construct them a few feet wider, as the amount of light which enters the pit is so much greater in proportion to the distance between the side walls.

Scale, quarter of an inch to a foot.

A Flow-pipe. Top heat.
B Return ditto. Ditto.
C Boiler.
D Bottom-heat pipes.
E Ventilators.
F Back sashes fastened to the ridge with hinges.
G Light cast-iron columns, 12 feet asunder, to support ridge.
H Surface line of soil.
I Oak leaves.
J Flues, which pass a short distance under ground and enter a flued fruit-tree wall
K Raised path, paved.
L Ground line.

Considerable difference of opinion exists as to whether pipes or tanks are the most efficient and economical means of supplying bottom heat. That the former are in every respect preferable to the latter has long been, with me, a settled conviction. It is not necessary to go to any length into the arguments on this subject, but it will be sufficient to state that the water flows more freely in pipes than in tanks or gutters, and consequently the heat is kept up with less labour, and with a much smaller expenditure of fuel. In addition to this, tanks are much more expensive in their first construction, and are objectionable from the irregularity of the heat they produce; for, while the soil immediately over where the water enters the tanks is too hot for the health of the plants, that over the part where the water re-enters the boiler is as much too cold. It has been suggested by some, that the heat would be too drying. This, however, is not the case; as a proof of which we find, when renewing the soil, roots in perfect health, within a few inches of the pipes. The advocates of the tanks or gutters lay much stress upon the moisture supplied to the soil by the evaporation from beneath; but we find this an injury rather than a benefit, as the moisture arising from the tanks is condensed in the soil, and by degrees the latter becomes so saturated, that in a few months' time it is totally unfit for the healthy development of the roots. This would be a great evil, if the plants were in pots, but it is still greater when they are permanently planted in the soil in which they are to fruit. Our pipes are laid on a bed of ashes or gravel, about 18 inches below the surface of the soil; and over the pipes is a ridge of gravel, the crown of which is 12 inches from the surface: the intervals between should be filled with Oak leaves, to the same level, thus leaving 12 inches for soil.

The soil we use consists of two-thirds maiden loam, from an old pasture, and one-third peat, in a rough state; these are mixed together and laid under a wooden platform, upon which are folded sheep, which are fed upon the short Grass from the lawns, and the refuse leaves of culinary vegetables. The platform is constructed of narrow strips of wood, placed far enough apart to allow the dung and urine from the sheep to fall through. After the soil has been there long enough to be saturated with the liquid, it is removed to a covered shed, till wanted for use, and its place supplied with a fresh lot. But as we think this matter particularly worthy of the notice of gardeners, we will take an early opportunity of making it the subject of a separate article. Before using the soil, if the loam happens to be of a stiff nature, we mix it with a proportion of clean pit sand, according to its requirements. In putting the soil into the pits, and in planting, great care is taken to avoid compressing it, and for this reason we begin with the back row, and plant it before putting in the soil for the second row. As the work proceeds, a slight watering is given, to settle the soil, and its surface covered with about an inch of fresh tan, which is excellent for this purpose, as it continues in the same loose and open state for a long time, absorbs heat rapidly from the sun, prevents too rapid evaporation, and, when moistened by the syringe, throws off very congenial exhalations.

If the plants have been previously grown in pots, the roots are carefully unwound and spread out into the new soil; but we generally prefer plants which have been grown without pots from their infancy. With this object in view, we devote a space along the front of each pit to the growth of suckers, and thus do away with the necessity of succession pits. This system enables the Pine grower of limited extent to keep a succession of fruiting Pines and plants in a single house or pit; and it is not less useful when larger quantities are cultivated, as by growing young plants in the front row, it allows of the entire surface of the bed being kept much nearer the glass than would be admissible if the pits were filled exclusively with fruiting plants. In the soil for the suckers we mix a small portion of rough new tan, which the roots delight in, and it facilitates their being moved with good balls. In this matter we have not the slightest difficulty, indeed the plants grow with the greatest vigour immediately after being shifted; and those which are moved with a ball of earth, have a decided advantage over those which have been previously grown in pots, unless indeed the pots were much larger than those which are ordinarily used for this purpose. Those which are lifted do certainly get a few of the points of their roots shortened, but they are always furnished with a supply of young feeders, which are ready on every side to strike into the new compost. To keep up a constant successional supply we plant out at all seasons of the year. As soon as a fruit is cut, the plant is pulled up, and after removing a basketful of the old exhausted compost, its place is supplied with an equal quantity of new material; in this the finest plant, carefully selected from the front row, is planted. This practice of filling up vacancies as they occur, may be continued for several years, till it is advisable to renew the soil in the pit entirely. In such a case we choose a period immediately after a rather large proportion of plants have ripened their fruits; and during the time which has been occupied by these in completing their maturity, we allow the vacancies to remain unreplenished, in order that at the time of clearing we may have fewer plants in the way. Of the latter, we carefully lift those plants which have not yet thrown up their fruits, and set them in a close shed; but those whose fruits are in progress we allow to remain, carefully clearing away the soil from around them, as far as it can be done without injury to the roots. After the old soil and leaves are cleared out, they are replaced with new materials in the same order as at first. In replanting, of course those which were lifted with balls are planted in the back rows, and the remaining rows of fruiting plants are supplied with the finest young plants from the fronts of the pits. After planting, at any time, the atmosphere for a few days afterwards should be kept rather moister than usual, and the shading more freely used than at other times, till the plants have commenced to make roots into the new soil.

It will be seen in the accompanying section that the line marking the surface of the soil is not more than 18 inches below the level of the wall plates. This will be found ample if the plants are grown according to the directions I shall lay down with regard to ventilation, which is, in my opinion, one of the most important points to be attended to. By allowing a constant and free circulation of air to traverse through the pits, and taking due care to make it pass over the surface of the hot-water pipes immediately on its entering, the plants do not grow near so large as they are generally seen under the ordinary modes of cultivation; but as the sap is more highly concentrated, the strength and vigour of these small plants is very superior to the large rampant ones which are grown in a closer atmosphere, and whose leaves can scarcely support their own weight. The advantages resulting from attention to this single matter of free ventilation are, that the individual plants, without being planted at greater distances, have a larger space in which to spread out their foliage, according to their natural shape; by which, not only the leaves themselves derive greater benefit from the sun and air, but the light is also enabled more freely to reach the soil, from which it is too often excluded by the dense mass of bloated leaves. Allowing each plant plenty of room, I consider one of the chief points in Pine growing; and as the plants do not grow so large under this mode of management, the gardener is enabled to plant them much nearer to the glass in the first instance,* and thus a greater portion of light is secured to both them and the soil during every period of their growth; and these several advantages, in combination with those arising from other points of management, in which the natural requirements of the plants are carefully considered, tend to the attainment of the grand object in view, namely, the production of the handsomest, largest, and best flavoured fruit.

This article will scarcely be complete without a few words on watering, and especially with reference to liquid manure. If the soil approximates in quality that described above, the use of the liquid during the growth of the plants would not only be unnecessary, but injurious; as the growth caused thereby would be too gross to be properly matured, and the natural consequence would be large plants with small fruits. But, after the fruit has made its appearance, artificial stimulants of this kind may be used with advantage, to assist it during its swelling, taking care, however, to discontinue watering altogether before the fruit begins to turn colour.

One of the opponents of this method of Pine growing has objected to it on the grounds that it produces a glut of fruit at one season, and a deficiency at another; but to convince doubters that such is not the case, we give an extract from our fruit-book of last year, showing the number that has been cut in the several months. We have in—

January	5	July	20
February	5	August	20
March	5	September	14
April	6	October	13
May	9	November	27
June	12	December	12

It may be interesting to some to know whether the cultivation of Pines on this method be profitable. The

* As an instance of how near the glass we grow them, I may mention that in 1847 we had to raise a square of glass to let up a fine fruit which weighed 6¼ lbs.

knowledge of the facts, that less labour by half is employed than would be necessary if they were grown in pots—and that the system of heating is, of all others, the most economical—would lead us to presuppose that it would pay a fair profit. But, to satisfy myself on this point, I last year sent fruit to market at different seasons, for the purpose of forming a correct statement of the value of the produce, founded upon the selling prices.

	£.	s.	d.
Value of the Pines ripened in 1849, if they had all been sent to Covent Garden, after deducting the cost of their carriage to London, which would be very heavy, owing to the distance	140	16	6
Cost of labour and coals at 9*s.* 6*d.* per ton.	80	0	0
Profit	£60	16	6

It is true that our coals are cheap in comparison with their price in the neighbourhood of London, but in the opposite scale we must mention the cost of carriage, and also the smallness of our pits, which precludes the possibility of growing Vines or other things along with the Pines, which is a custom often adopted by large growers for Covent Garden Market. This advantage enables them to meet the additional expence incurred in fuel. *G. Fleming.*

DISEASES OF PLANTS.

(*Continued from p.* 70.)

Genus XIII. Heterophyllia, *or Diversity in the Form of Leaves;* and Genus XIV. Heterocarpia, *or Diversity in the Form of Fruits.*—Botanical works and memoirs of scientific academies are full of descriptions of instances of extraordinary vegetation, by which fruits or leaves assume unusual forms or modes of development. Such are the numerous large-leaved forms of Cabbages and Lettuces. Diversity of climate has great influence on these changes. It is curious to observe the Erysimum alliaria L., and in different stations. On the summits of mountains it is dwarf, barely half a hand high, with narrow leaves covered with stiff hairs, and bearing but very few flowers. Descending towards the plains it gradually increases in size, till on the borders of ditches we find it eight or ten times as high, with large leaves of a beautiful green. Plants which will vegetate equally well on dry ground and in water, have often their leaves very differently formed in the two situations. Sometimes *heterophyllia* is accompanied by other diseases; thus the prolification of the Rose is generally attended by an alteration in the form of the leaves, and numerous similar instances may be observed in any walk over the fields.

Fruits also offer to us analogous irregularities, and none more so than those of the Orange tribe. In the Orange itself, with perfect seeds and pericarps, the fruit is often covered with crests, tubercles, and other inequalities. Lemons and Citrons vary still more, some have more or less deep circular indentures which are surmounted by expansions of the rind, having a rude resemblance to a crown; others are so shaped as to imitate, in some measure, the human hand. All these deformities may be originally caused by climate, soil, and vicissitudes of the weather. These diseases are, however, merely accidental, and do not usually affect the ordinary functions of the plant, and appear of no account to the cultivator. But considering what I have said in the definition of what is disease in a plant, they could not have been passed over in silence.

SELECT FLOWER AND KITCHEN-GARDEN SEEDS.

As cultivators of gardens are now making their purchases of seeds for the season, perhaps it will not be out of place to point out a few of the most choice and useful varieties, concerning the culture of which we shall treat in the Calendar of Operations as the proper times come round.

Amongst plants for the stove and warm conservatory, do not omit Thunbergia alata and its varieties, Ipomœa bona-nox, I. rubro-cærulea, and I. Quamoclit, Hibiscus insignis, H. Manihot, Momordica sp., Gomphrena globosa, Balsams, Cockscombs, and other general favourites.

Amongst useful plants for the greenhouse and cool conservatory are Schizanthus, Primula sinensis, and Rhodanthe Manglesii. A very nice lot of Calceolarias and Cinerarias may generally be obtained by procuring a packet of seed from any respectable dealer, or well-known grower of these flowers; of course, show varieties must not be expected, but, for conservatory or drawing-room decoration, they will save more expensive varieties. One of the most beautiful creepers for the cool conservatory is Tacsonia mollissima; it is of a delicate rose colour, and very graceful in habit, beautifully adapted for hanging in natural festoons from the roof of a lofty house; its fruit is also interesting, especially when it bursts, and displays its wax-like seeds. It will flourish in a very cool greenhouse, and, as it generally seeds under good management, it may be procured by this means.

In the way of biennials or perennials for partial protection, or entire exposure in the flower garden, we may particularly instance the following, which may be raised from seeds. First and foremost we place the Humea elegans, which requires growing one year as a frame plant, to prepare it for planting the next year; it is by far the most graceful and ornamental half-hardy plant which finds a place in the flower garden. Stachys, Pentstemons, and Antirrhinums are pretty and useful plants, which require very little protection; and amongst those which do not need any protection, the most striking are Alstrœmerias, the Hollyhock, perennial Larkspurs (Delphinium), Monkshood (Aconitum), and several species of Dianthus, Campanula, and Papaver.

Hardy and half-hardy annuals are so numerous that we shall only mention a few of those which are deserving of a place in every garden, however small. Those which succeed better if raised under glass, and afterwards transplanted, are Lobelia gracilis, L. erinus, L. ramosa, and their varieties; Phlox Drummondi, Saponaria calabrica, Calliopsis, and if room can be afforded them, German Stocks and German Asters. Those we select for sowing in the open ground are the following:—Centaurea cyanus and depressa, Bartonia aurea, Clarkias, Calendula (Marigold), Collinsias, Corydalis, Delphinium Ajacis, Eschscholtzia, Gilia tricolor, and G. achilleæfolia, Godetia, Iberis (Candytuft), red and white; Lathyrus odoratus, and others; Malcomia (Virginian Stock), Nemophila, Tagetes (French and African Marigold), with Marseilles, French, and other double Poppies.

One or two of the above are worthy of particular attention: the first of these is Delphinium Ajacis, the branching Larkspur, than which nothing can be more beautiful or useful; it is equally appropriate for planting singly in mixed beds, in straight lines, or in large masses, and these may be either dwarf or tall, by simply pegging the plants down, or by tying them up. Centaurea cyanus, growing 2 feet high, and C. depressa, 5 inches high, are equally beautiful, and exceedingly useful in making bouquets.

Before we conclude this section of the subject, it will be proper to notice a few half-hardy ornamental creepers, of which seeds should be procured: these are Calampelis scabra, Lophospermum, Maurandya, Scyphanthus, Cobæa scandens, and the different varieties of ornamental Gourds; of the latter we would particularly mention the Turban, or Turk's Cap, and the Bottle Gourd, as these two varieties are considered hardier than others.

We close these remarks with a few words on kitchen garden seeds. Nothing can be more absurd than for a gardener to encumber himself with an extravagant number of varieties of the different culinary vegetables.

Of Peas we content ourselves this year with four varieties; two of them, Bishop's Dwarf Long-podded, and Fairbeard's Champion of England, we proved last year to be far superior to those we had previously grown, and which had been selected in former years after careful experiments. The other two kinds, which we still grow this year, are Hairs' Dwarf Green Mammoth, and Burbidge's Eclipse.

We have one sort of garden Bean "The New Royal Cluster;" and one variety of Kidney Bean "The Dwarf Prolific;" these two Beans we last year proved to be superior to all other Beans which have come to our knowledge.

One kind of Borecole is enough, the dwarf hardy green; and of Broccoli, we know only four varieties, which we have tested in former years, viz., Snow's Superb White, Knight's Protecting, Early Purple Cape, and Early White; and two new late ones to try against our older favourites, viz., Imperial Winter, and Elletson's Mammoth.

Of Cabbages, we have the true Early York for culinary Cabbages, Drumhead for "Sour-krout," and Chappel's Colewort for the purpose which its name implies.

Of Cauliflowers, the early Asiatic and the Walcheren are what we use.

Of Carrots, the Dutch Horn for forcing, and the Altringham for general crop.

Of Celery, we limit ourselves to one kind, Cole's Superb or "Celeri violet," a variety of undoubted superiority.

Of Lettuces, we select the Brighton Cos or Paris Cos, the hardy Hammersmith Cabbage, and the Drumhead.

Of Onions, for general crop, the White Spanish, the Deptford, the brown, and white Globe; for Salads, the two-bladed for pickling, the silver skinned; and for autumn sowing, the Tripoli.

Of Radishes, one long-rooted variety, and the red and white globular, with black Spanish for winter use, and the white Naples to produce roots for pickling.

Of Spinach, the round for summer use, and the hardy prickly for winter.

Among the items which ought not to be omitted are the Ice-plant for garnishing, Chicory and Lamb's Lettuce for winter Salads, Hamburgh Parsley for the sake of its roots, and Nicotiana Tabacum for fumigating

In the above remarks I have not noticed those vegetables of which only one or two varieties exist, even in seedsmen's lists, as mistakes can scarcely take place in such places. *The Writer of the Calendar.*

TRADE MEMORANDA.

We have to thank "Vigil" for his information respecting Messrs. Boden, Russell, and Higginbottom, mentioned at page 70. It is exactly what we anticipated.

Home Correspondence.

The Wire System of Fastening Fruit-trees to Walls.—In an article by Mr. Fleming, which was given in your Paper for the second week in July last, these objections were brought against this system of fastening. 1. That the young shoots get behind the wires. 2. That the shoots are kept at too great a distance from the wall. 3. That the shoots become half sawn off by rubbing. I own that there is a liability of the shoots growing behind the wires; but he must be a negligent gardener who permits it to take place to any injurious extent. Secondly, the distance of the shoots from the wall is entirely regulated by the stay-nails, only such a space being necessary to be left as to allow of the bass or any other ligature which may be used to pass between, which, I suppose, must also be the case if studs were used. Thirdly, during the experience of six years the shoots have not been found to have been injured in the way mentioned by rubbing. Therefore I conclude that Mr. Fleming's statement, that wires can only be employed against flues with advantage, is rather too sweeping; for all the gardeners whom I have known to have tried the plan are extremely pleased, and say that it does not require half the labour, and is greatly superior to the old method of nailing. I do not hereby mean to say that studding may not be a better method, for I have not tried it; but I should suppose it requires a much more evenly built wall than the fixing of wires does, and also does not offer the same facility of keeping young shoots in their places by stretching twigs across them. It certainly seems to be less expensive, though I believe Mr. Fleming has placed the expense of the other too high; for at the following prices, which I do not consider to be over moderate, I calculate that a square yard of wiring will cost 4*d.* instead of 7½*d.* A pound of wire (No. 13), 4½*d.* per lb.; stay-nails, 8*d.* a score; fixing, 2*s.* a day. In the garden from which I take my facts the wires were fixed by a day labourer six years ago. They have been painted once since, and not one single wire has either been broken or become loose. *T. A.*

Felling Larch.—There cannot be a doubt that the proper season for this operation is when the tree is full of turpentine, which is during spring and summer, and at no other season should resinous trees be felled. The wood of the Larch is as durable and nearly as hard as Oak, if felled at the proper season; but if felled in winter, its quality is very inferior and soon decays. *A Practical Sexagenarian Arborator.* [We doubt the soundness of this opinion. See the next letter.]—I have a small plantation (12 or 14 acres), consisting of Oak, Larch, and Spanish Chestnut. A few years since the Oaks were in some places nearly stifled by the Larch; but as I did not want Larch poles at the time, I had some of them stripped early in spring, and allowed them to stand, thinking they would die off immediately, out of the way of the Oak, but, to my surprise, the tops kept alive, and actually grew a little through the summer (though the stripped part seemed quite dead), the foliage only dying off two or three weeks before that of the unstripped trees. In the following spring I had them felled, and the carpenter, who had worked Larch largely, pronounced them to be decidedly the very best he had ever used or seen. *U. L.*

Mutual Benefit Societies for Gardeners.—In an age of association like the present, it is strange that so little has been done by gardeners in the way of organised efforts, to bear each others' burdens in times of sickness, distress, and old age. From the whole of these none are certain of exemption, and at such times, many of us need something to fall back on. The cause of this indifference may probably be traced in part to the prosperous circumstances in which some are placed, and in part also to the difficulty which such an undertaking suggests. Now, being conscious myself of the desirability of benefit societies among gardeners, I will briefly state what my views are respecting the practicability and mode of their formation and conduct. I would have each society to be composed of gardeners, properly so called, or in other words of persons whose abilities have been tested and approved of by their respective employers, and are or have been in the receipt of the average amount of head gardener's wages. This arrangement may perhaps be objected to, on the ground of its excluding young and deserving aspirants; but if the case does not admit of an alternative, and if the scheme should prove as advantageous as I anticipate, I trust that it will operate as an extra stimulus to their exertions in the pursuit of their object. I would propose next that the amount of admission money and of weekly subscriptions should vary according to age, 10*s.* as the former and 6*d.* as the latter being the lowest. In case of illness each member should receive from the fund about 10*s.* weekly, with medical attendance, and at death 5*l.* should be paid towards his funeral expenses. I have fixed the items of disbursement at a low figure, because the accumulation of a substantial fund is highly essential to the permanency of the society, and also because the aim of the society should embrace an object in addition to those named, viz., the granting of assistance to members whom the vicissitudes of service or other circumstances might involve in pecuniary difficulties. Small loans might also be granted to members whose character and prospects would warrant a belief in their ability at a given period to refund the same. There is many an honest and intelligent gardener who, after enduring the privations consequent upon the want of an engagement for one, two, or more years, is obliged to enter upon a situation all but penniless, bearing the marks of poverty upon his back; by such a person the value of a loan of this kind would be appreciated. I place these general features of the scheme before the public, merely remarking that I feel the utmost confidence in its practicability—a confidence inspired by the character of the class of persons by whom it will be worked. I think it is likely that there will be a society of the kind established in the neighbourhood of Windsor, and it would delight me to hear of such associations becoming general throughout the land. *W. Sherwood, Englefield-green, Surrey.*

Rose Insects; Effect of Liquid Manure on Roses; and continuous blooming kinds.—Allow me to thank you for the explanation given in your Leading Article of the 19th inst. to a fact which has formerly much perplexed me. I had, I suppose, like many others, been struck by the observations made in your Paper with reference to the "snags." I adopted the suggestion, and with the most marked benefit; but in the course of last summer I had occasion to cut an old stem of a transplanted Brennus Rose, which had suffered from removal, and seeing one of the holes, for which I keep a constant look out, at the end of the piece which I was about to remove, I split it open, expecting to find, as usual, one of my enemies of the maggot race. To my surprise a shining black fly made his escape, and at the bottom of the boring I found at least 100 or so of aphides. I was puzzled to think what could be the connection between them, and also puzzled by the appearance of the aphides, as they were more like the fly which infested the Spruce Fir a few years ago than the common Rose aphis. Your notice fully explains the whole affair, and accounts for the appearance of the aphides. Allow me, however, to question the soundness of giving up the original advice which you were the means of conveying to us. I for one shall rebel against the advice of 1850 in favour of that of 1849; and allow me to suggest that, at all events, there are hundreds of snags, too small for your fly or for aphis, which harbour maggots and which should be cut off. Your friend, if watched a little more narrowly, will be found I think to burrow in any dead wood—Ash poles (to which I tie my tall Roses), Scarlet-runner sticks, or Rose wood of the second or third year's growth, the thickness of one's little finger; but pray do not let him be made the protector of the whole race of maggots which may be found in the thin small twigs of Roses, the white Provins, for instance, especially. I tried liquid manure last year with Roses; the result of my experiments was, that old large plants, just coming into bloom, were amazingly improved by it, and enabled to open, when I think that without it they would have failed. Lamarque, La belle Parabere (June), Solfaterre, Celine (June), were the trees which I watched especially; but in the case of young, lately-planted trees, not in bloom, I did great mischief to them by applying liquid manure. The dry hot summer may have partly caused the failure in that case. A correspondent of yours wishes to know of Perpetuals for lengthened blooming. I find the best of mine to be some selected from Wood's (of Maresfield) catalogue in the class of Noisettes. Lamarque, Solfaterre, Luxembourg, against a wall; the two former are splendid. Liberal feeding and pruning keep these going from May or June to November. I cut Cloth of Gold, two good blooms, in the last week of November. *C. E. C.*

Birds.—I do not think that your remarks (p. 22) are applicable to the birds that infest gardens. 1. The green grosbeak or green linnet. 2. The chaffinch. These birds feed only on small seeds, and I cannot find any one who can say he has seen anything else eaten by them. No. 1. Destroys the Polyanthus, I do not know why. 3. The sparrow feeds upon grain in the winter and on fruit in the summer, and is never seen hunting for insects. 4. The greater titmouse. 5. The lesser titmouse. These birds destroy fruit buds in the spring, and are very destructive in the Pea borders. At other times they feed on Oats, of which they are very fond. They also are fond of flesh and fat, and are found in butcher's shops. 6. The bullfinch eats nothing but fruit buds when they can be had, and at other times seeds and winter berries. This is by far the most mischievous bird in gardens. 7. The blackbird or black ouzel. 8. The thrush or throstle. These birds are wholesale eaters of fruit; when there is no fruit, they feed on earth-worms and berries. They are of service in reducing the number of earth-worms, but these birds are in such vast quantities, that in the absence of all birds of prey, it is quite necessary, if fruit is to be had, to destroy many of them. The blackbird will eat Gooseberries until he stupifies himself, and in this state may be shot. At other times it is difficult to do so. I am not aware of any bird eating to this excess but the blackbird. The thrush is not so voracious as the blackbird. The titmouse will not be scared away like other birds, but is readily caught in wire traps, which is not the case with the sparrow and chaffinch. Sparrows will go into brick traps, but occasionally a robin is killed; the use of them has been discontinued in my garden on this account. The titmouse is fond of flies, but is not swift enough on the wing to catch many. The swallow tribe do this work more effectually, as they eat nothing but flies, being never seen feeding on the ground. All the books on natural history which I have seen, give a favourable account of birds, and would lead us to suppose that all of them do more good than harm. Many persons speak of the little birds as if all of them destroy insects; but I hope I have made it appear that this is not the case. *A. A.*

Vine Borders.—I am sorry that I have not been sooner able to make a few remarks on the contrast and apparent contradiction which seemed to exist between a statement of mine and one signed "G. R." brought into comparison with it, in the *Gardeners' Chronicle* of the 15th of December last. But if both statements be carefully considered, I do not think that they will be found to disagree, for "G. R.'s" directions for the use of carrion would reduce it, in the strict sense of the word, to a rich and dry compost; and it is moreover recommended to be used for the purpose of enriching a border of loose and dry materials, as any other manure might be, whereby all the evil effects of carrion, as such, are done away with. This is quite a different thing from putting under Vines whole carcases of horses, dogs, birds, or other large pieces of carrion [to be sure it is], and that, too, in a stiff cold soil, as is often recommended, and which I think so injurious. I certainly agree with "G. R." (we both rejoice in initials only, so our disagreements could not be carried far) in thinking blood, if applied in a proper manner and at proper seasons, to be one of the very best liquid manures that can be put to a Vine border. *T. A.*

Rat's-bane, properly so called, a Settler for the Million.—When I published, in your Paper of January 12, the irreparable loss I had sustained by an army of rats, who had remorselessly eaten up all, save 11, of my large and favourite family of "pet" birds, collected at much cost, and with considerable trouble, during a period of 20 years, I felt sure that some at least if not all your correspondents would sympathise with me, and assist me to the utmost of their ability in placing the enemy *hors de combat*. Nor did I reckon without my host. From all parts of the United Kingdom have I received letters of condolence, many of them conveying hints invaluable for my guidance, in carrying on the war of extermination with certainty and despatch, and emphatically requesting that the result of my proceedings might be made publicly known. In the columns of the *Gardeners' Chronicle* too, there have appeared each week some valuable suggestions which I have carefully noted, and for which I hereby tender my best thanks to the kind writers. For the benefit of all who may hereafter fall victims to the rapacity of rats, I will now, as briefly as may be, lay before them my military tactics, and explain how I finally brought up my *corps de reserve*, which gained me a decisive victory. Instead of commencing hostilities at once, on discovering the extent of the ravages committed, I gave encouragement to the enemy, by throwing in his way divers articles of food, such as dripping, lard, meat, bones, fish, and other dainties. This gave him confidence, and threw him off his guard, so that he revelled unsuspiciously among all the good things of this life, while I was secretly plotting his destruction. I took care, meantime, to secure all the hen-houses, and shut the inmates up every night, to protect them from their blood-thirsty foe. The great field-day was Friday last, a day I shall long remember. I devoted it entirely to strategy; and, *Nil actum reputans dum quid superesset agendum*, I completed all my arrangements before the hour of dusk, impatiently waiting for the rising sun of the morrow. Poison was my weapon; fresh herrings and sprats were my aides-de-camp. The poison was carbonate of barytes, ground to an impalpable powder, and phosphorus. An incision was first made in the backs of the herrings, and the carbonate of barytes well rubbed in. The parts were then, as artistically as possible, reunited. The sprats being smaller than the herrings, and more plastic, were pierced through their sides with a sharp piece of deal wood. Had a knife, a fork, or the human hand touched them, all would have been vain. The barytes was then "drilled in," and other sprats, not poisoned, were placed above and below them, so that suspicion was disarmed. "*Latet anguis in herbâ!*" It should be borne in mind that the barytes is without taste and without smell; hence its great value. The way in which I applied the phosphorus would take more space to detail than you can well afford in one number of your Paper. At a future time, I will gladly furnish particulars of this, and other interesting matters, connected with my recent experiments, for I have been both a "sapper" and a "miner!" When the preparations were all completed, I stationed my trusty messengers in every part of the garden and shrubberies—some under trees, some in flower-pots, some hidden by a brick, others partly imbedded in the garden walks, &c., &c. They "did their bidding" right bravely! on coming down stairs, the morning following, I found the enemy had fallen into the snare.* There was a serious diminution of the provisions furnished for their repast, and the hand of death was observable on every side. They had eaten ravenously; they had been seized with cruel thirst; they had sated themselves with water; they had "burst their boilers!" To use an expressive, and most appropriate classical quotation, there was a visible "*Decessio pereuntium—successio perituro rum*," which clearly proved I had won the day. In a word, two days and two nights effectually routed the whole army, and I was left master of the field. If it be urged by some, as perhaps it will be, that I am cruel, consider the aggravation, an unprovoked and brutal attack upon a large affectionate family of sleeping innocents, who were ruthlessly snatched from their beds at midnight, torn limb from limb, and their agonised bodies crunched; aye, "crunched" is the word, between the fangs of murderous assassins. Oh! "Had they ten thousand lives, my great revenge has stomach for them all." *William Kidd, Sander's Cottage, New Road, Hammersmith, February* 5.

* It is worthy of note, that the usual snares and gins, employed for the purpose of catching rats, are of little or no use, when the creature is "quartered" where he can obtain animal food. Rats can readily smell the hand that sets the snare, and also the bait touched while suspending it on the hook. By this it is evident that rats are "up to trap," and must be outwitted by good generalship.

Societies.

LINNEAN, *Feb.* 5.—W. YARRELL, Esq., in the chair. The Rev. G. Capel, W. Febitt, Esq., and J. Buckman, Esq., were elected Fellows. Dr. Lankester laid upon the table the works of the Ray Society for the year 1849, consisting of a volume of papers on botany, and Dr. Baird's beautiful monograph on the British Entomostracous Crustaceæ. The following address to Mr. Brown, on the occasion of his being elected to the Presidency of the Society, was then read by the Secretary, in the absence of Dr. Wallich, who had been deputed by the Royal Bavarian Botanical Society to present it.

Viro eminentissimo, edoctissimo, emeritissimo,
Domino Domino ROBERTO BROWNIO, D.C.L.
Permultarum Societatum Litterariarum Socio et Patrono,
Et nuper Linnæanæ Londinensis Præsidi electo,
Botanicorum Antistiti,
Qui Antipodum Floram primus et pæne solus digessit,
Explorans fideliter quas et ipse legerat et alii reportarunt plantas,
Qui complures Plantarum Familias Naturales ordine disposuit,
Exquirens fortiter novas et neglectas generum notas,
Qui Physiologiam Stirpium plurimis investigationibus dispunxit,
Exponens feliciter morphoseos et geometrices botanicæ leges,
Qui reliquias Pristinæ Floræ fossiles discretim discussit,
Expandens florenter intimam lignorum structuram,
Qui denique hodiernæ Phytographiæ et Phytologiæ aperto discrimine
Et pater et stator et auctor exstitit,
Et, quod faustum nomen socio imposuit Germanorum Academia distincto,
Ceu alter Raius per totum orbem famam sui dispersit,
Honorem, quo et se ipsam et virum ornavit Societas Linnæana,
Promovendo in sedem patroni divi Linnæi talem vicarium,
Societas Botanica Ratisbonensis Regia
Calendis Januar. MDCCCL. Piè gratulatur.

Mr. Gould exhibited specimens of a new species of Menura, which had been taken on the Richmond River, in New South Wales. He stated that a few weeks ago he had the honour of dedicating a species of Ptiloris, a very beautiful genus of birds, to her Majesty, and he proposed to dedicate the present species of Menura to the consort of the Queen, under the name of M. Alberti. Mr. Gould stated that this was no mere compliment to the Queen and Prince, on account of their rank, as they had claims on the naturalist on account of their liberal patronage of natural history science. He also exhibited a new species of lobster, and two new Lepidopterous insects from Australia. A continuation of Mr. Huxley's paper on the Structure of some Forms of Medusæ was read.

Review.

An Address delivered at the Annual Fair of the Newhaven County Horticultural Society, Sept. 26, 1849, by J. B. Parsons. Newhaven (U. S.): 8vo, pp. 49.

It must be confessed that in the United States things are done in a manner which shocks ancient English feelings, and would raise from their graves, if that were possible, the departed officials of some of our decrepid scientific corporations. Here we have a Horticultural Society calling its anniversary meeting "a fair," and what is more strange, intrusting the delivery of an official address on the occasion—not to its President, or one of its own officers, nor even to one of its members, but to a stranger, a nurseryman who seems to have been accidentally in the neighbourhood.

Unusual as is this, according to our notions of official propriety, yet it is impossible not to admit that the Newhaven Society was right, for a better address than that delivered by Mr. Parsons we have seldom read; and although we do not precisely recommend the example of the Society in question to be followed here on all occasions, yet we think the circumstance, like all such circumstances, well worth the consideration of those who have country societies to manage.

What sort of address this was will be collected from the following extracts:

"And as one of the very best means of interesting parents in the pleasures of the country, I deem these horticultural societies and their exhibitions. They are springing up too in every part of the country. Towns and villages of the east and far west, wherever slavery is not found, are organising them. They are changing the character of our products, increasing the wealth of our country, and giving new pleasures and interests to our people."——

"During the year 1847, the number of bushels of Wheat produced in the United States was over 114,000,000; of Indian corn nearly 540,000,000; of Oats nearly 168,000,000; of Potatoes over 100,000,000; and nearly a million more of Barley and Rye and Buckwheat and Beans and Peas; while in pounds there were, of Cotton, 1,041,000,000; of Tobacco, 220,000,000; of Rice, 103,000,000; of Sugar, 325,000,000; of honey, 23,000,000, with sundry other articles, amounting in the aggregate at their market value to more than 838,000,000 dollars. For the same year, the value of the produce of orchards, gardens, and nurseries was more than 54,000,000 dollars. Of live stock and its products, there were 60,000,000 pounds of wool; 23,000,000 of swine slaughtered, besides horses and sheep, and beef and poultry, and dairy, valued in the aggregate at 252,000,000 dollars. There are no data by which we can form any estimate of the amount of capital employed in the cultivation of the soil; but we have stated sufficient to show that it is the great interest of the country; for, without attaching any value to the capital employed, the value of the articles produced by the soil amount to nearly 1,145,000,000 dollars; while the produce of all other industry, forests, fisheries, and mines, with the capital employed in commerce, manufactures, insurance, banks, profits of interest, and of the professions, and rentals of houses and lands, all taken together, amount in the aggregate to less than 869,000,000 dollars."——

"There is no species of farming the profits of which can compare with those of the Peach orchard. Within a few miles of my residence there is an orchard of 20 acres, which is said to have produced 2000 dollars per

year, the vegetables between the trees paying the expense of cultivation. The Strawberry crop is also very profitable, particularly where irrigation can be obtained. Nearly 5000 bushels are every season sold in the city of New York, and to the cultivator the profit per acre is enormous. From our frequent drought, however, this crop is more precarious unless it can be supplied with water. The Grape can also be profitably cultivated, and the vineyards of Dr. Underhill are said to yield a net profit of some 4000 dollars per annum." . . . "American Apples command a high price in England, and I have seen the Newtown Pippins selling in London at 9 and 10 cents each. So popular is this Apple there, as I was told by the dealers, that no other American Apple, particularly no red Apple, could be sold while this was in the market. This variety is exported largely by R. L. Pell on the Hudson River, and his nett profits on this fruit are said to be some 8000 dollars per annum. Such are the facilities now of steam navigation, that we can export readily, and with large profit, all the finer Apples and Pears, with one or two varieties of Peaches."——

"The graduate of our colleges comes forth with some of the mental characteristics essential to a good farmer or horticulturist—the power of concentration, habits of reflection, and refined taste, all of which may be given him by the study of the classics and the exact sciences, to which the time of the college student is mostly devoted. But more than these is essential to the horticulturist or to the tiller of the soil. He needs habits also of close observation, which can be given him effectually only by the study of the natural sciences; and he wants, too, a practical and familiar acquaintance with these sciences, with chemistry, with botany, with geology, &c., to enable him to apply his knowledge effectually. The professor of the classics or of mathematics may contend that the time allowed to students at college is too short to admit of obtaining accurate knowledge of natural science, except by neglect of those branches. If such is the case, it were better they should be neglected. For all the purposes of mental training I am inclined to think the study of physical science as valuable as the study of exact science, and how much more practically valuable. Scarcely one student in a hundred, 10 years after he has left college, has any recollection of conic sections or integral calculus, but he can readily recollect all that he may have learned of geology or chemistry or vegetable physiology, because this knowledge is exercised every day, if he resides in or often visits the country. To one possessed of this knowledge, every tree and plant and rock and clod of earth speaks a language and possesses an interest unknown to one who may have passed with honour through the highest seminaries of learning."——

"In the meantime,
'Would you be strong? go follow up the plough;
Would you be thoughtful? study fields and flowers;
Would you be wise? take on yourself a vow,
To go to school in Nature's sunny bowers;
Fly from the city; nothing there can charm—
Seek wisdom, strength, and virtue on a farm.'"

Miscellaneous.

The Sheffield Gardeners' Instruction Society held its first annual meeting on the 23d ult. It appeared from the report which was read that various horticultural works, including two gardeners' newspapers, had been purchased and circulated among its members during the past year. The report also referred to the papers presented at the monthly meetings, from which, and the discussions thereon, much interesting information had been communicated. The treasurer's account showed a balance in hand of 1*l.* 4*s.*, after payment of all expenses. The Society then proceeded to elect officers for the ensuing year, when the president was re-elected, and a secretary and fresh committee appointed.

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

The hot-water pipes of plant structures and forcing houses may be an ornament thereto, if kept in proper order; but they are the reverse of this if allowed to become dirty or rusty. Our method is to paint them black when they are first fixed, and afterwards to renovate their appearance by rubbing them over with a little boiled oil, once in a season. This is, of course, considerably cheaper than painting, and is very easy of application, while it answers the purpose as well, if not better, than the paint. We mention this now, as time to put these matters right can be better spared than when the season is farther advanced.

PLANT DEPARTMENT.

As a great majority of the plants in this department will soon require repotting, a sufficient stock of all requisite materials should be prepared before-hand; and with regard to soils, this should be particularly attended to. It is in many places a difficult matter to get good peat, but, without it, fine-rooted, hard-wooded plants cannot be grown to perfection. If, therefore, healthy well grown specimens of these kinds are an object worth trying for, no trouble must be considered too great in procuring suitable soil. As the amount of daylight increases, the temperature of the greenhouses may be slightly raised, particularly in fine clear weather; but be cautious not to excite stove plants, especially hard-wooded ones, until the days are longer, as a much greater difference exists between the light of their natural habitats and of our climate at this season than between the latter and that of the countries whence our greenhouse plants are introduced; hence these last are less liable to be injured by a temperature approaching their own natural one, in conjunction with our dull atmosphere. Stoves and the Orchid-house should not range higher than 55° to 58° at night; forcing-house, 60°; greenhouse, 40°; Heath-house, 36° to 40°. Take care that no moisture falls on the flowers of Orchids, or their beauties will soon be destroyed. If a speedy development of the flowers of any species which are now showing be desired, they may be removed into the forcing-house.

FORCING DEPARTMENT.

The fermenting material on the outside borders of Vines in action must be carefully managed; maintaining a steady mild heat, avoiding alternations of heat and cold. It should, therefore, be considered before the forcing commences, whether the supply of litter will be sufficient to produce the necessary temperature as long as it is required. The thermometer should be daily examined, and the temperature of the litter kept between 65° and 75° as extreme points. With proper attention, this can be effected at a small cost, either of labour or fermenting material. STRAWBERRIES.—A succession of these should be brought forward once a fortnight, by advancing each section a stage, and following them up with a further supply from the cold frames. As they are removed to the shelves of the forcing house, it will be an advantage to place pans under the pots, as the water is liable to pass off without properly moistening the soil, and thereby doing serious injury to such a moisture-loving plant as the Strawberry. The water which runs into the pans should not be allowed to remain in them longer than necessary to allow the roots and soil to absorb as much as they require. Any water remaining in the pans after a sufficient time has elapsed for this purpose should be emptied out, as nothing tends sooner to give a bad flavour to the fruit, than water in the pans, and it sours the soil.

FLOWER GARDEN AND SHRUBBERIES.

Let no exertion be wanting to render this department perfectly clean and neat; any large trees which are condemned should be removed, and all dead or decaying branches cut out of those which are to remain. If it were not done in the autumn, the surface of all the clumps should be dug or forked over, adding manure or compost where it is needed. At the same time, any necessary alterations in the arrangement of the plants should be made; and where they are too thick, the least desirable should be removed. It is a great pity to see masses of choice shrubs crushing together, and compelling each other to stand on tiptoe to get a peep at daylight; but ridiculous as such management undoubtedly is, the case is a very common one in English gardens. If fine specimens are desired, let every bush or tree stand distinct and free from its neighbour; spread out all bushes that will admit of it, and prune, support, or draw down, according to their individual requirements. In regulating the clumps, very fine specimens of different shrubs will attract attention, either on account of the symmetry of their form, or the peculiar beauty of their general habit. The best of these should be selected, and planted in appropriate positions on the lawn, where they will show themselves to the greatest advantage on all sides. In connection with the digging and regulation of the clumps, the edgings should be clipped, and the turf and gravel cleaned and rolled. By finishing every part as you proceed, a much greater quantity of work may be done by the same means, thus giving satisfaction at the same time both to yourself and others.

HARDY FRUIT GARDEN.

Bulfinches are very destructive to the buds of various fruit trees, and an effective means of preventing their ravages is to paint over the whole of the branches with a mixture of slacked lime and fresh cow-dung. It is probable that the eggs and larvæ of various insects will be smothered at the same time. To prevent the bulfinches injuring tall Cherry trees, we know of no means except shooting them. A single pair of these birds will, in a few days, entirely destroy the buds of a very large tree; this will show that these enemies cannot be too strictly watched.

KITCHEN GARDEN.

Those who have not yet set their Potatoes, should no longer defer it, as the bitter experience of the last few years has afforded abundant testimony as to what course must be pursued, if we would have even a chance of success. The principal points which demand attention are, to plant early varieties only, as soon in the season as possible, and to plant in open airy situations, in dry well drained ground, without manure. The sets should be planted 6 inches deep, and if a few handfuls of burnt clay or well charred refuse be placed about them, the produce seems to ripen quicker and cleaner, without being deteriorated in quality or size. On a warm border make another sowing of Radishes, and one of Early Horn Carrots. In very favourable localities, Onions, and an early bed of Parsley, may now be sown. The Leek is very hardy, and cannot be sown too early, as its excellence depends upon this, and upon being transplanted as soon as the plants are large enough, into a piece of rich well-prepared ground. Late sown, bad Leeks, are worse than weeds.

State of the Weather near London, for the week ending Feb. 7, 1850, as observed at the Horticultural Garden, Chiswick.

Feb.	Moon's Age.	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean	Wind.	Rain.

Satur. 16	46.1	31.4	38.7	4	0.23	3	3	1	2	—	7	6	2

The highest temperature during the above period occurred on the 10th 1831—therm. 65 deg.; and the lowest on 11th, 1845—therm. 3 deg. below zero.

Notices to Correspondents.

AMERICAN BLIGHT: *Somerset Gardener.* Destroy it by means of spirits of tar applied with a common painter's brush.‡

BOOKS: *E C.* Roberts' book on the Vine will poesibly suit you ‡—*A B C.* We make it a rule never to give prices or recommend dealers.‡

CANNAS: *A H.* C. indica and C. iridiflora may be preserved out of doors, but with little success, unless in a very warm and rather dry situation. The roots may be kept alive through the winter by means of a thick covering of any dry material, such as Fern. It is much better, however, to take them up and winter them in soil in a cellar, or other similar place out of the reach of frost.¶

CANTUA BICOLOR: *M C.* You are not very likely to flower this and others by the middle of April. If you have a mind to take the chance, then force them smartly, without loss of time.

DIPPING CAMELLIAS IN HOT WATER TO KILL SCALE: *K.* Water of 130° or 140° used with force from a syringe might not harm the plants, while plunging the shoots in water of these temperatures in all probability would injure them, and particularly if the leaves were young or thin in texture. When the infested shoots are plunged into the heated water for any length of time, the temperature should be much lower than if the water was applied by a syringe; it is better to make a second application with water at a much lower temperature, than to use it once only at 150°, which is too high for plants with leaves on them.¶

DISEASES: *Ilex.* Next week.

FASTENING LABELS TO FRUIT TREES: *F.* Use tarred twine *loosely* tied, or *loose* copper wire.

FRAXINELLA: *H R K.* It may be propagated by seeds, or by dividing the roots.‡

FORTUNE'S YELLOW ROSE: *T.* It was shown by Messrs. Standish and Noble, at the garden exhibition of the Horticultural Society, in May last. It resembled Jaune Desprez, but is more coppery in colour.‡

GARDEN POTS: *Diss.* The following "is the correct nomenclature of the several sizes:"

Old Name.	Usual Breadth in inches.	Usual Depth in inches.	New Name.
Twos ...	18	14	18 inch.
Fours ...	15	13	15 ,,
Sixes ...	13	12	13 ,,
Eights ...	12	11	12 ,,
Twelves ...	11½	10	11 ,,
Sixteens ...	9½	9	9 ,,
Twenty-fours ...	8½	8	8 ,,
Thirty-twos ...	6	6	6 ,,
Forty-eights ...	5	5	5 ,,
Sixties ...	3½	3	3 ,,
Thumbs ...	2½	2½	Thumbs.

GLASS: *R B.* The thinnest rough plate.—*W.* About London, the price per foot of 16 oz. sheet varies from 3½*d.* to 6½*d.*, and that of crown from 2½*d.* to 6*d.*, according to quality.‡

INSECTS: *J W.* Thanks for the hornet cocoons. The other specimen is a mass of the cocoons of the Ilithyia sociella, a social moth. Pray look out for the larvæ of Ripiphorus for us. *W.*—*Sylvanus.* The insect sent is the wood-boring Sirex Juvencus. Respecting the Babylonish Cylinders, apply to Mr. S. Birch, at the British Museum; or Professor Wilson, at the East India House. *W.*

NAMES OF PLANTS: *G P L.* Melilotus leucantha.—*Constant Sub, tired of the ignorance of gardeners.* It is no proof of your gardener being ignorant that he cannot tell you the names of two Ferns: probably he never saw them before, and if he had, it might be as they now are, viz., without names. Ferns are not grown in every garden; in but few are correctly named; are difficult of determination; and, unless you have chosen a gardener who has made the study of botany a part of his education, and has books to refer to, you must not expect him to name uncommon plants. If he had served in any great botanic garden, he (although not a botanist) might have learned the names of these Ferns by rote; the large one is Cassebeera hastata, and the small piece, Adiantum pubescens. *S.*—*P B and another.* Next week.

ROSES: *Ravenswood.* They are attacked by an Erysiphe, a parasitical fungus. You should carefully cut, *to the ground*, all the branches on which it appears, and burn them. Prune your Ivy when it suits your convenience, except when it is growing *fast.* The cuttings will readily strike root; at any time of the year except winter—now.

SEEDSMEN: *A Yorkshireman.* You must consult your solicitor. We cannot give legal opinions.

SUNDRIES: *Hortulanus.* Small unburnt coal is injurious to the tender spongelets of the roots of plants if it contains much sulphur.—Buy Dr. Lindley's "Elements of Botany," and Johnson's "Agricultural Chemistry," with Low's "Meteorology," and Reid's "Law of Storms."

TACKLE FOR TIMBER RAISING: *Wilfordiensis* writes thus—"Can you, or any of your correspondents, inform me of the best method for raising a large Cedar tree which was blown down in a violent gale of wind last night? It is about 60 feet high, and the bole measures 5½ feet diameter just above the ground. It stood on a lawn, and was most ornamental. If raised, would it be likely to grow, with great care? The roots do not appear to be much injured, as the surrounding ground was very light in texture. We have taken the precaution to cover all the roots that were exposed with good soil, and covered the whole with leaves." The information is wanted at once, because the tree is now lying on its side. It will, however, take no further harm, if the part thrown into the air is covered with leaves.

VINES: *R G.* Use hot-water pipes rather than flues. You can grow in the house, besides what you mention, Kidney Beans, Strawberries, Aubergines, and Capsicums; and you may force Figs, as well as Rhubarb, Seakale, &c. We doubt, however, your success with Melons.—*J C L.* West's St. Peter's, Black Morocco, Black Frontignan, Black Hamburgh; Muscat of Alexandria, Cannon Hall Muscat, White Nice, if allowed to become *amber coloured;* White Sweetwater.

MISC.: *A Subscriber.* Your complaint shall be attended to. If, as you say, "almost every number" were defective in this way, we must ourselves discover it.

SEEDLING FLOWERS.

CINERARIA: *Beginner.* Colour, violet purple; size and texture good; petals rather narrow for their length, and scanty in the circle.*

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. HARTLEY and Co., precisely at their prices. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½*d.* per foot.
10 by 8	,,	14 by 10	at 5*d.* ,,
14 by 10	,,	1½ foot	at 5½*d.* ,,
1½ foot	,,	3 feet	at 6*d.* ,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

Milk Pans from 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

JAMES PHILLIPS and CO., 116, BISHOPSGATE STREET WITHOUT, LONDON.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded, on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, of Bristol, and of Nailsea, Somerset, beg to inform Engineers and others, that they are prepared to supply GLASS PIPES of from 1 to 4-inch bore, in lengths of from 3 to 7 feet; the lengths being less as the diameters of the bores increase.

GLASS FOR CONSERVATORIES AND HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per ft.

HEATING BY HOT WATER.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE IMPROVED "FLUE BOILER" AND FURNACE.

W. HILL begs respectfully to inform the numerous applicants for his "FLUE BOILER" of a small and intermediate size, that he shall be prepared, early in December, to supply sizes to suit every description of Apparatus, from that of 100 feet of 3-inch pipe to 2000 feet of 4-inch pipe. A List of Sizes and Prices will shortly be published. W. HILL guarantees his Boilers to be the most effective and economical of any in use.

Horticultural Works, Greenwich, Feb. 9.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.—Direct to JOHN LEGG, Cheltenham.

IMPROVED FOUR-HORSE PORTABLE STEAM-ENGINES AND BOLTING OR THRESHING MACHINES.

FREEMAN ROE AND HANSON, Southwark Iron Works, and 70, Strand, beg to call attention to their Steam-Engines and Threshing Machines, which are more economical in fuel, for the quantity of work done, than any before the public. They may be seen any day at their works, Sumner-street, Southwark Bridge-road.—Water-rams for raising Water. Deep Well Pumps; Baths; Hot-water Apparatus; Fountains. Towns supplied with Gas or Water.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. GIBBS and SONS, the Importers.

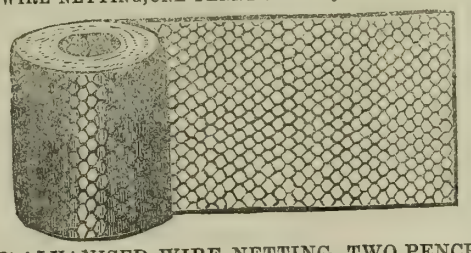
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. ODAMS and PICKFORD, 15, Mark-lane, London.

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.



IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.*	per yard	30 inches wide	7½*d.*	per yard
18 ,, ,,	4½*d.*	,,	36 ,, ,,	9*d.*	,,
14 ,, ,,	6*d.*	,,	48 ,, ,,	1*s.*	,,

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

SEEDS.—FOR SALE, some cwts. of SKIRVING'S SWEDISH TURNIP, WHITE BELGIAN CARROT, and ORANGE GLOBE MANGOLD WURZEL SEEDS; ripened last summer on Whitfield Farm, near Berkeley, Gloucestershire, at 8*s.*, 6*s.*, and 9*s.* per imperial stone, respectively.

Apply to Mr. MORTON, Whitfield Farm.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.—The WINTER SESSION will commence on Friday, the 15th of February, 1850. All new students are required to attend for examination on the preceding day. Those who purpose entering as students for the ensuing session are requested to apply (either by letter or personally) to the principal, at the College, Cirencester, Gloucestershire, for the necessary admission papers.

By order of the Council, PHILIP BOWES, Secretary.

London, Office, 26, King William-street, West Strand.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron—His Royal Highness PRINCE ALBERT.
President of the Council—Right Hon. Earl Bathurst.
Vice-President—Right Hon. Earl Ducie.
Principal—John Wilson, F.R.S.E., F.G.S., &c.
Chaplain and First Master—Rev. L. C. Edwards, M.A.
Second Master—J. D. Pemberton, C.E.

RESIDENT PROFESSORS.

Agriculture—John Wilson, F.R.S.E., &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Natural History, Botany, Geology—Jas. Buckman, F.G.S., &c.
Mathematics & Natural Philosophy—Rev. L. C. Edwards, M.A.
Veterinary Practice—John Barlow, M.R.C.V.S.
Surveying and Practical Engineering—J. D. Pemberton, C.E.

OBJECTS.

The object of this institution is to provide such a course of instruction as will be most useful to the Agriculturist. The benefits to be derived from a judicious application of scientific information are becoming more and more extensively acknowledged, while the means of obtaining that information, if indeed it can be obtained at all without for the time sacrificing a due attention to the practical operations of husbandry, are so scattered and costly as to be within the reach of very few.

The College course of instruction is conducted in such a manner that while the student is well based in the principles of each science, its relations with agriculture are specially touched upon and explained, and their practical application shown as far as possible in the operations of the College Farm. The theoretical and practical instruction go hand in hand, and the whole is combined with the advantages of collegiate discipline.

By order of the Council,
PHILIP BOWES, Secretary.

London Office, 26, King William-street, West Strand.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.—GLASGOW SHOW, 1850.

The SOCIETY'S AGRICULTURAL MEETING and GENERAL SHOW is to be held at GLASGOW, on the 31st of JULY, and 1st and 2d of AUGUST. The competition is open to Exhibitors from any part of the United Kingdom. Stock, Implements, &c., must be entered with the Secretary on or before the 20th of June.

In addition to the ordinary Premiums, there will be a Sweepstakes for the best Short-horn Bull of any age, to which the Society will contribute 25*l.* Subscriptions (2*l.*) of competitors must be intimated by the 1st of May, when the list will be closed.

Copies of the Premiums and Regulations, and Forms of Certificates of Entry, may be had on application to the Secretary.

By order of the Directors,
J. HALL MAXWELL, Secretary.

Edinburgh, 6, Albyn-place, Feb. 9.

DR. NEWINGTON'S IMPLEMENTS. — Persons requiring these Implements this spring, must make early application. A stock of HAND-DRILL HOES, with the various fittings; HAND-DIBBLES, with and without wheels, and various other Sowing Machines and Agricultural Implements of Dr. Newington's Invention, may be seen at Messrs. DUFAUR and Co.'s, 21, Red Lion-square, Holborn, London. A Prospectus and Lecture on these methods of Agriculture sent, gratis, on application.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8*l.* per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees—Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

The Agricultural Gazette.

SATURDAY, FEBRUARY 9, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	Feb.	13—{ Agricultural Society of England. / Highland and Agricultural Society.
THURSDAY,	—	14—Agricultural Imp. Society of Ireland.
WEDNESDAY,	—	20—Agricultural Society of England.
THURSDAY,	—	21—Agricultural Imp. Society of Ireland.

THE oral discussion of subjects connected with Farm Practice is a mode of exhibiting and elucidating facts that can scarcely be too highly recommended to the notice of Agricultural Societies. It is not merely useful to the members themselves, whose wits can scarcely fail of being sharpened by contact, but when such discussions are published, they are peculiarly suited to impress and convince the minds of the whole farming fraternity, in consequence of the large amount of individual experience they elicit. The speakers at meetings held for the improvement of practical agriculture are generally the most zealous, and, without disparagement to others, the most intelligent of the class to which they belong; and, as a somewhat necessary consequence, they naturally

unite in forming that vanguard of explorers whose duty and inclination lead them to the fresh and unbroken territory of progressive improvement, and thus to enlarge the bounds of our present knowledge. They are, in fact, the lights as well as the beacons of the agricultural world; for their discoveries, when crowned with success, never fail sooner or later of being turned to personal advantage by hosts of less adventurous labourers; while on the other hand their errors and failures are equally important and useful, from the warning they convey.

It is true, however, that the establishment of improvements in agriculture is slowly and tediously effected; so much so that it would seem as if the amount of evidence required to give them currency must, to bring conviction, be far more abundant than what would be demanded or considered necessary in any other department of experimental inquiry. And this remark is true, not merely in regard to those great improvements which are apt to startle the cautious by their extreme novelty, but also in regard to other practices which are neither new nor untried. As an illustration we may instance the self-evident necessity there exists for every farmer who cultivates Turnips—and who does not, now-a-days?—storing up a sufficient quantity of these roots to supply his stock with food during that period of winter when frost and snow render it impracticable, or at least difficult, to carry it from the field. The tendency of the agricultural mind at present is evidently towards individual exertion, in order that low prices may be met and neutralised by a more vigorous personal effort in endeavouring to improve the details of farm practice. Many of these details are so exclusively within the tenant-farmers' own control, that, if neglected, he can scarcely look for assistance or even expect commiseration from those who would otherwise willingly befriend him in carrying forward those more extensive and important improvements which call for co-operation on the part of the landlord.

These remarks have been suggested partly by a discussion which took place at a late monthly meeting of the Highland and Agricultural Society of Scotland, on the best modes of storing Turnips in winter, and partly by a personal acquaintance with the fact that very many farmers do not lay up a store of Turnips at all in winter, and thus by their practice prove their disbelief in its utility. A four weeks' continuance of frost and snow has probably brought a slight conviction that it would have been as well to have provided against a contingency so common in a climate such as ours, by laying in previously a store of Turnips sufficient to have lasted through a storm of moderate length; but it is to be feared that, with many, such a conviction will weaken and ultimately vanish as the frost and snow disappear with returning good weather. The speakers at the meeting referred to were no doubt so convinced by long experience of the indisputable advantages of storing Turnips, as not to deem it necessary to waste time in advocating a practice so palpably and self-evidently useful. Their object was to elicit as many opinions and facts as possible on the details of the practice itself, being perfectly satisfied and unanimous in regard to its utility; but it is doubtful if that practice be as general even in Scotland as might be expected from the proverbially economical and provident habits of its farmers. How many flocks of sheep and lots of cattle have been fully supplied with unfrosted Turnips during the last fortnight? The greater proportion, it is to be feared, have not been so comfortably circumstanced. We have had occasion lately to see many flocks of sheep dotting the dreary surface of the snow-covered fields, and striving, but unsuccessfully, to scrape the frozen crust from their food; and in what state is it when reached? Every Turnip bulb as hard as an Ailsa Craig curling-stone, and requiring such an amount of nibbling and chiselling on the part of the poor animals as must be sadly detrimental to the fattening process; if, indeed, which is more likely, they do not lose fat rapidly, from the chilling effects of masticating such cold as well as "short commons," conjoined moreover with exposure to a temperature far below the freezing point. The cattle on such wretchedly managed farms seldom fare much better than the sheep, if we may judge of their treatment by the not unusual spectacle of a number of people employed in the Turnip fields excavating the bulbs from under the snow, and carting them home to the farm steading.

The waste of food in such cases must greatly diminish the profits of feeding; and yet how easily might it be avoided by a little foresight and extra exertion in laying up a proper supply of Turnips before winter sets fairly in. Those who contend for the advantages of giving Turnips fresh and juicy from the field to stock, cannot surely suppose that they are sufficiently great to counterbalance the evils necessarily entailed on the animals by several weeks' semi-starvation. No doubt Turnips, as well as other roots, lose weight by being stored any considerable time; but it is the opinion both of Professor Gregory and Dr. Anderson that this loss of weight is principally due to evaporation of water from the bulbs and not to the disappearance of nutritive matter, which could only happen either from decomposition in the substance of the Turnip itself, or from the juices exuding from the parts where the tops and tails are cut off. But even admitting that there is a considerable loss occasioned in consequence of rotten bulbs, and bleeding from the cut surfaces, still a much greater loss is sure to be sustained in the field from the depredations of various animals, both winged and four-footed; besides, there is the main objection already urged, that by leaving the whole crop of Turnips in the field, only to be carried home when required, the risk of partially starving the stock during frost and snow is rendered certain. In addition to the testimony of men of science to the fact, that the storing of Turnips is not attended by any noticeable loss of nutritive material, we have what will be considered more satisfactory by some, the statements of several of the most intelligent and best practical farmers of East Lothian and Mid-Lothian, that it is a regular part of their system of farm-management to store up a large quantity of Turnips for the use of their stock in winter. The details of the process are extremely simple; all that is necessary being to get the Turnips carted home free of frost and as dry as possible, and cover them plentifully with straw of any kind to protect them from frost.

The disadvantages of not adopting the practice have been forcibly brought before us by a particular instance in our own neighbourhood. A flock of 12 score of 4-year-old breeding ewes, deprived of Grass by half-a-foot of snow on the surface of the ground, have been receiving daily for some time back a couple of cart-loads of *frozen* Turnips, knocked out of the snow by mattocks at no little trouble and discomfort to the workmen. The consequences to the flock at lambing time cannot be otherwise than disastrous; for Turnips, at all times dangerous and unwholesome food for ewes carrying their young, are particularly so when given to them in a frozen state. Another instance may be mentioned of a flock of wether sheep folded on Turnips, which, when we saw them, seemed to have given up scraping away the snow from the buried bulbs beneath from sheer fatigue. Now, in either case, how can any hope or expectation of profit be reasonably entertained? In the former case, deaths among the ewes at the lambing season cannot but be the result; while, in the latter, the fat must be rapidly withdrawn from the body to supply the waste of the lungs—a waste which is greatly increased by the highly condensed state of air at the freezing point. Such wanton mismanagement is the more inexcusable when we consider how easy it is to throw a few acres of Turnips together in clamps of three or four cart-loads each, in different parts of the field, and cover them with straw and a few shovelfuls of earth, to keep it from blowing off with the wind; and how convenient and satisfactory it would be, in frost or snow, to cart or wheel out on the surface as many as could be consumed each day?

Economy, as well as humanity, calls loudly for a general adoption of the system of storing Turnips before winter; and now that we are put to our own resources to meet depressed prices by improved practices, such a glaring and too common neglect as we have alluded to, should not be allowed to exist. If we ever hope to make a profit by fattening stock, with mutton and beef at 5*d.* per lb., we ought to take care that "John Frost," in his annual visit, do not merely eat up our profits, but also a large slice of what should go to pay the expense of growing our Turnip crop.

NOTES OF FARM PRACTICES IN 1776.

Scotch and English Farming—*Bexley, Norfolk.*—We went into the barns, where they were threshing Barley and Wheat; the Barley put up as hay, the Wheat in stacks. I drew out some of the Barley to see the length of it, and was much surprised to find the stalks of it only about a foot long, and what we, in Scotland, call "nirly." "Was not this a very bad crop, Mr. Leader?" "No," says he, "it was middling." "Pray how much may you have off an acre?" "About 5 coombs," says he (2 coombs are a 30th part more than a Winchester quarter). "And how much Wheat?" "About 6 coombs." "Only six," says I; "why, as near Edinburgh as you are Norwich they get 16 bolls, and a boll and a coomb are very nearly the same." We next went to the Turnip field that he had sold, and pray what do you think was feeding there? Why, cows, and calves which were as big very near as their mothers, and yet sucking; he informed me that some people found it profitable to bring up calves thus for the London market. They buy old cows, in spring, at the calving, at about 3*l.* or 4*l.* apiece, let them run at Grass all summer together, and at Martinmas put them upon Turnips, as forerunners to sheep, allowing them only to eat the leaves, and then put the sheep to eat the root. These calves they sell in March, when about a year old, at 7*l.* or 8*l.* a piece; and Mr. Leader assured me they will often weigh 25 stones and upwards, and being constantly fed to the full, they weigh like lead.

Jan. 11.—We, in Scotland, envy the English their fine country, their industrious servants, and everything we do not know about. Mistaken fancy! But it is the case everywhere, that people are not content with their own situation, but think that others, whose condition they are not acquainted with, are much better than they; for my part I have been reflecting a good deal since I came here upon what of the productions of the ground have as yet come within my reach, and, without hesitation, I pronounce Scotland far the preferable country. I envy them their ploughing and economy in some things, but for their soil or their servants I envy them not; the small "nirly" corn I have seen here we would reckon no crop at all. Would the farmer within four miles of Edinburgh take six bolls an acre for a crop? They would plough it down ere they reckon it a good one, and when I speak of the farmers in Midlothian getting 12 and 16 bolls an acre, they cry out, "Oh! what a country that must be." "Yes," says I, "if one knew how to manage it." When I tell Mr. Leader of a field being let for four or six years of white crop running, "Do what you please with the land here," says he, "it would not do that; we would have nothing at all the third year." I have been enquiring likewise about their servants, and find that the farmers are, in a manner, slaves to them.

April 21.—Mr. Brett, of Messingham, has fed within this last month six or seven cattle on Barley-meal and Oat-straw—it comes very expensive, but necessity has no law—where is the necessity? a Scotsman would say. A Norfolk man, says, "I would rather starve myself as not see my fat bullocks get forward." *N. B.*

FARM ESTIMATES.

The following is the cost and return of farming at present prices, as furnished by Mr. Watson, of Kellor. It is unnecessary to give his estimate under former prices, for, excepting that the returns are moneyed out at 20 to 30 per cent. less than those, the calculations are the same.

Returns of Produce from a Farm of 500 acres, on a five-shift rotation, on an average of past years.

Dr. Charges.				Cr.
Rent of 500 acres, at 32*s.* per acre ...	£800	0	0	
Interest on invested capital, 3000*l.*, at 10 per cent. per annum	300	0	0	
Ditto on floating capital, 2000*l.*, at 5 per cent. per annum	100	0	0	
Expenses of management, wages, insurance, tradesman's accounts, Grass seeds, &c., at 20*s.* per acre per ann.	500	0	0	
Annual loss on live stock by disease and accidents	100	0	0	
Public burdens	50	0	0	
—1850	0	0		
Profit				106 0 0
				£1956 0 0

Returns.				Cr.
Oats from 100 acres, at 48 bushels an acre	£4800	0	0	
Off for servants, horses, seed, &c. ...	2400	0	0	
Bushels, at 3*s.*	2400	0	0	—360 0 0
Wheat, spring, 40 acres, at 32 bushels per acre	1280	0	0	
Less seed	160	0	0	
Bushels, at 7*s.*	1120	0	0	—392 0 0
Barley, 60 acres, at 42 bushels per acre	2520	0	0	
Less seed, horses, &c.	500	0	0	
Bushels, at 4*s.*	2020	0	0	—404 0 0
Profits for live stock fed upon 200 acres Grass, 100 acres greens				800 0 0
				£1956 0 0

Signed, Hugh Watson, Kellor.

The comparative loss of 412*l.* at present prices, is made out by reducing the prices of the corn about 30 per cent., and the returns from the live stock 20 per cent. Such reductions being assumed to be the consequence of free trade. But if credit be taken for so large a depreciation in the value of the returns, as the consequence of a reduction in the prices of food, surely some allowance from the charges should have been made; for is it not clear that farmers will participate with all other classes in the economy which cheaper food produces? But it is rather to the high scale of charges on the one side, and to the smallness of the returns on the other; to the large rent and high cultivation, and implied corn fertility of the land—as contrasted with the smallness of the corn and cattle returns, that I would draw attention; for certainly upon the expenditure with the system of farming here adduced, I believe no English farmer would ever anticipate other than loss.

The cropping adopted is the five-course, of greens, Barley, and Wheat, seeds down two years, and Oats. The charges on the debit side amount to 1850*l.*, with 516*l.* for corn consumed by men and horses, and for seed, deducted from the returns, making a total of 2366*l.*, an average of 94*s.* 7*d.* per acre per annum, exclusive of any purchase of stock. The rent is put at 32*s.* an acre, a price that certainly commands a fertile grain growing soil. The capital at 10*l.* an acre. This can be employed only under high cultivation, larger corn returns, and use of fine stock. The expenses, 20*s.* an acre, with corn allowances amounting to 20*s.* 7*d.* more, making a total of 40*s.* 7*d.* per acre per annum, are also on the highest scale.

In a word, land rented at 32*s.* an acre, employing 10*l.* an acre capital, and an expenditure of 40*s.* 7*d.* an acre per annum, may fairly be expected to be highly cropped, and making much more than ordinary returns; but we find Mr. Watson gives but 40 acres of Wheat, and a gross produce of only 2472*l.*, as the entire returns of 500 acres of fertile grain-growing land; and with this soil and this outlay his course of cropping admits of only 200 acres of corn, and of which only 40 acres are Wheat. If against this we contrast the ordinary Norfolk four-shift rotation, viz., greens, spring corn, seeds, and Wheat, a rotation which has been adopted for the purpose of fertilising poor soils, and adapting them to the growth of grain, and which admits of less corn being grown in the rotation than does the course usually taken on land of the description in question, we shall find, "against Mr. Watson's 160 acres of spring corn and 40 acres of Wheat, producing 1156*l.*," we have 125 acres of spring corn and 125 acres of Wheat, producing 1822*l.* We have further to notice that by Mr. Watson's showing, of his 500 acres, 300 acres are annually applied to feeding of stock, at a loss of 550*l.* per annum; for the only return from these is the 800*l.* profit of live stock, which, are kept at a cost of 1350*l.*, viz.:

Rent, 32*s.* an acre	£480	0	0
Interest on capital on 300 acres	240	0	0
Expense of management, wages, &c. ...	300	0	0
Corn payments and consumption	200	0	0
Loss on live stock	100	0	0
Public burdens	30	0	0
	£1350	0	0

So that if Mr. Watson's estimate be correct, Scotch farming under former prices has had the serious error of allowing the loss from the live stock to absorb five-sixths of the gain from growing corn; and the imperfect acquaintance with accounts has admitted of a system and rotation so defective being held up as a public example. Although, doubtless, one must allow something for the spirit of partisanship in these calculations, still as the principle of keeping stock for the purpose of growing grain must be dependent on the amount of loss incurred in the stock returns, I cannot but be doing a service in showing to what an injurious extent this may be carried by thus exposing these extracts, which are given as the farming of the first farmers in Scotland. That I may not leave the question here, I attach charges and returns that, as I conceive, will prove much nearer the mark, ever bearing in mind we are dealing with land described as fertile grain growing, the rent, &c., being put at 34*s.* an acre, and the capital that has been employed being 8*l.* an acre.

The annual charges and returns for 500 acres of "fertile grain-growing land," cultivated on the Norfolk 4-shift rotation, and calculated on present prices. (To be put against Mr. Watson's calculations in "Blackwood's Magazine.")

Dr. Charges.				
Rent, rates, tithe, at 34*s.* an acre			£850	0 0
Interest on capital, at 8*l.* per acre, viz.,				
2000*l.* invested at 5 per cent. ...	£100	0 0		
To give back the capital in 20 years ...	100	0 0		
2000*l.* floating, at 5 per cent.	100	0 0		
			300	0 0
Wages, at 24*s.* an acre			600	0 0
Corn consumed by horses and for seed...			350	0 0
Tradesmen's bills and sundry charges...			150	0 0
			£2250	0 0
Balance profit, in addition to 5 per cent. per annum, allowed for interest on capital			309	7 6
			£2559	7 6

Returns.			Cr.
62½ acres of Oats, at 7 qrs. per acre, 437 qrs., at 17*s.*...	£371	17 6	
62½ acres of Barley, at 5 qrs. per acre, 312½ qrs., at 28*s.*	437	10 0	
			809 7 6
125			
125 acres of Wheat, at 3½ qrs. per acre, 437½ qrs., at 40*s.*			875 0 0
Cattle returns from grazing...			
125 acres of roots			
125 ditto of Swedes			
250 acres, at 3*l.* an acre			750 0 0
Ditto from consuming the straw, the growth of 250 acres			125 0 0
			£2559 7 6

Thus a tenant may realise, at free-trade prices, on a capital of 4000*l.*, a return of 509*l.* 7*s.* 6*d.* per annum. One glaring error in "Blackwood's" calculations has been to assume the same capital and the same amount of wages against the low returns under low prices that he has against the higher under former ones, whereas, if the prices of the returns from farming are to fall in the ratio it has been assumed, a capital of 4000*l.*, and a scale of wages of 25*s.*, will represent 5000*l.* and 30*s.*—food being 25 per cent. dearer, and already the wages of the agricultural labourers have been reduced fully in this proportion on the last two years. *Hewitt Davis*, 3, *Frederick's-place, Old Jewry, London, Jan.* 15.

PRICES OF WHEAT.

Some of your readers may be interested in the following curious Table of the Prices of Wheat in England, collected from the earliest authorities (which I have appended to each date, with the expressions made use of by them in mentioning the prices). The difference of the value of money prevents, of course, all modern comparison; but the extraordinary variations in successive years, and even before and after harvest in the same year, afford a strange picture of the times to which the dates refer. The fluctuation is no less than from 1*s.* 6*d.* to 5*l.* 4*s.* the quarter! Should it be thought sufficiently interesting I will (in your next Number) continue it down to the commencement of the last century—when the records are of easier access, and lose their curiosity. *C. Wren Hoskyns.* [Pray do.]

TABLE OF THE PRICES OF WHEAT IN ENGLAND, FROM THE MIDDLE OF THE ELEVENTH TO THE END OF THE SIXTEENTH CENTURY.

Year.		£	s.	d.	Authority.
1043	"So great a famine in England that a sester (Sextarius) or quarter of Wheat sold for"	0	6	0	Huntington;
1125	"The dearest year in England ever known"	0	6	0	Robert de Monte Do.
1190	"So great a scarcity that at Salisbury a qr. of Wheat sold for"	0	13	4	[ciosum Chron: Pre-

Home Correspondence.

Loans under the Private Money Drainage Act.—You state in your last Number "that some of the large Life Assurance Offices have intimated to the Inclosure Commissioners their willingness to advance money to landowners, for the purposes of the 'Private Money Drainage Act, 1849,' on reasonable terms." Now I have ascertained that two of the offices demand 5 per cent. interest on any sums under 3000*l.*; and consequently the rent-charge to pay off 100*l.*, with interest, in 22 years, would be 7*l.* 12*s.* per annum, besides the expenses incurred in surveying, mapping, and inspecting the land drained (say 1*l.* per cent.), making 8*l.* 12*s.* per annum. Considering that Consols are now at 97½, these do not appear to be reasonable terms. The rate charged by Government was 3½ per cent., making the rent-charge 6*l.* 11*s.* 11*d.* for 100*l.*; and, as about two-thirds of that loan of 2,000,000*l.* was taken by Scotch landowners, and nearly as much, I believe, has been granted to Irish landlords during the last three years, would it be too much to ask of ministers a loan of 1,500,000*l.* or 2,000,000*l.* for the English landowners, on the same terms, as the best means of honestly relieving landlords, farmers, and labourers from their present difficulties? *Salop.*

Arsenic.—Your correspondent, "J. B.," says he prefers this, as a pickle for seed Wheat, to sulphate of copper (*i. e.* blue-stone). Such, however, has not been my experience; for after several years' practice with arsenic, and successfully too, as far as the prevention of smut in the crop, I have for the last 10 years used sulphate of copper more to my satisfaction. The chief recommendation of the latter above the former, to me, is its safety in the hands of any one except the principal. I bestow extra dressings with my machine upon the corn intended for seed, which renders the tedious practice of skimming in the pickle unnecessary. I dissolve 1 lb. of blue-stone in a gallon of boiling water, which should be diluted with sufficient water to make 9 gallons. This is delivered through the rose of a common watering-pot over the Wheat the day before it is wanted, and stirred well upon a brick floor. I consider also that Wheat thus prepared is much safer to keep a short time, in case unfavourable weather should retard the operation of committing it to the soil, than if prepared with arsenic. I have known three-fourths of the seed destroyed by weather preventing its being used, where arsenic was applied, whereas I have had portions left in sacks when beat off by weather, for even weeks, without suffering from a preparation of blue-stone. I wish your correspondent had at more length described the drill he mentions for using his seed with, as in Suffolk we are acquainted with no (new) drill suitable for Wheat for double the amount he names. *W. S. G.* [Our Wheat is pickled thus: 1½ lbs. of sulphate of copper and 2 gallons of water are sprinkled in solution over 8 bushels of Wheat, and the seed is ready for sowing in an hour. The solution must be held in an earthenware vessel. It will soon *eat* its way out of a watering-pot.]

Destruction of Rats and Mice.—This subject having frequently occupied a place in your columns, as indeed its importance deserves, I am disposed to send you a prescription, which has succeeded with me, where the most noted have failed. The phosphoric poison so much vaunted, did very little. Arsenic tried in many ways was hardly more effective, the little grittiness of the powder annoying their teeth, or warning them of danger. And arsenic in solution is not so convenient, nor quite so easy to place without danger to domestic animals. Without recapitulating the other poisons tried, I will at once mention the effective one; which, notwithstanding the underground communication now rendered so general and complete, by the recent sanitary regulations, keeps my premises free; or if traces of either rat or mouse appear, gets rid of them in a day or two. The substance is precipitated carbonate of barytes, not the native carbonate, which is as gritty as arsenic, whilst the precipitated is as fine and soft as fine flour. It is best prepared by the druggist, as most used to such things; but the following is the method, and it can be done by any careful and skilful person. Dissolve 1½ oz.

carbonate of soda (common washing soda), in half-pint water; and in another half-pint, 1 oz. muriate of barytes. Pour the soda about a wine-glassful at a time into the solution of barytes, and shake well at each addition. The liquid will become white and thick, and must be thoroughly shaken when all the soda is in. Then set it aside to settle quite clear, which may take 12 hours or more. (It will settle much quicker if made with hot water; but the powder is then not so fine, and does not answer so well.) When settled quite clear, pour off the liquid as close as possible; fill the bottle again with water, and shake it well up, to wash out all soda &c., from the sediment. Let it settle clear again; pour off again; turn out the white powder on a filter to drain, and dry it. It will clot in drying, but is easily rubbed down fine again. To use this, mix ¼ oz. of it with 2 oz. lard, and ¼ oz. flavoury cheese (good Dutch cheese answers very well); smear it over bread like butter, or make it up with crumbs or meal into little balls like marbles; or still better, smear it over the rinds of fried bacon; and place it in the holes and tracks. For rats, the addition of two drops of oil of aniseed, to the 2 ounces of lard, seems to be more attractive; but I have not observed this addition to do much for mice. *J. Prideaux.*

On Rearing Calves.—I was much struck by seeing in your columns, a few weeks ago, a communication from Mr. Thomas Sadler, stating that he was in the habit of rearing his calves by continued feeding from the time they were calved; that he sold them at 22, 24, and 26 months old, at from 20*l.* to 24*l.* each; and that he had found this way more profitable than buying in lean beasts at the markets and fatting them. Now it needs no observation to see that this is not the usual way; but is it not consonant to common sense? Firstly, it agrees with the well-known maxim of a "quick return;" secondly, it is entirely analogous to our treatment of sheep, which have firstly their mother's milk, secondly the best Grass the farm affords, in winter as many Turnips as they can eat; with perhaps some addition of hay or meal, and are sold fat at from 12 to 16 months old. This is the way they are treated now. How were they treated formerly? Why, exactly in the same way as we now treat our calves; they were let scramble on as they could for two or three years, and then fatted. It is acknowledged, in the case of sheep, that the forcing system is far the most profitable, and why should it not be so in the case of cattle? There is this difference of course in the two cases, that the sheep's milk would be wasted if not given to the lambs, whereas the cow's milk, which is taken from the calves, itself brings a considerable profit. It is therefore a question of degree, whether, if you determine to rear and fat beasts on your own farm, you ought not to suffer the loss of a few cheeses, or a few pounds of butter, for the sake of bringing your beasts to market one or even two years earlier; the mere being out of the interest of your money for such a time is something, but this is not the only advantage. How many calves die annually, or from some disease in their calfhood, caused by want of sufficient nourishment, never attain their proper size and health, and are a loss when they should be a gain, it is of course impossible to estimate, but that the loss must be considerable is evident. Who has not seen a calf, the smallest and sickliest of the lot, not only recover from incipient disease, but actually outgrow the others, from being allowed to suck a cow for one, two, or three months. *Anonymous.*

Report on the Implement Show of the English Agricultural Society.—The following memorial to the Society was forwarded towards the close of last year's weekly meetings. "Richard Nicklin, of Glenville, near Douglas, Isle of Man, most respectfully calls the attention of the President, Vice-President, and the Council of the Royal Agricultural Society of England, to the following suggestions. It is particularly to the implements that attention is desired, as their increasing number being so great it is impossible for those attending the shows to view them sufficiently; and there never being more than one-fifth of the subscribers attending any one of the meetings, would it not be greatly to the benefit of the subscribers generally, if accurate and plain illustrations of all the prize implements were given with the report on the exhibition of implements at every show? Now, the subscribers not having that report until about six months after the show, and many of them waiting for it before they purchased implements, it would be greatly to their benefit if it could be had sooner. Could this be done by the Society having stamped sheets, as newspapers, and when the report is ready, to be forwarded as newspapers are? At present each part of the journal costs 6*d.* sent through the post, and six sheets of the largest size allowed by law would contain as much matter as the generality of them hitherto has had—for on folding a single number of the *Times*, there will be found 60 pages rather larger than those of the Journal—besides, there are lectures delivered at the meetings, if of the greatest importance then four-fifths of the subscribers will not have it until they get the next part of the Journal, which is generally six months after, but if sent by the stamped paper, they can have it very soon after it is ready for printing. If this plan was adopted as soon as there is sufficient matter to fill a sheet, it could be forwarded much earlier than at present."

Agricultural Memoranda.—Dining the other day with some dozen of our most respectable agriculturists, certain opinions were broached. It was unanimously agreed that deep drainage, or indeed anything more than furrow drainage, was useless on heavy land. Subsoiling, or deep cultivation, was pronounced to be injurious and unprofitable, having been tried by two gentlemen present. It was also asserted that liquid manure was of no benefit to the land—and that also was stated by one who had tried it. The company approved the sentiment. I quote the foregoing to show how strong a hold prejudice has yet on many very respectable agriculturists. A knowledge of chemistry would at once convince a farmer that the urine of animals contained the most soluble and valuable parts of the manure. A reference to the cottager's garden on a poor heath, or other neglected spot, should settle the question of deep cultivation, and as to drainage, a reflection as to how the heavy land got wet, and a glance at a beer tap in the lowest part of a cask ought to bring conviction. My heavy land 5 feet drains to-day were extremely busy pouring forth in an energetic and curvilinear stream the heavy rain of last night, minus I hope some of its ammonia and carbonic acid. Just finished threshing one half a field of Wheat, which was recommended to be ploughed up in the spring, being thin sown and slug eaten; produce over 40 bushels per acre. *J. J. Mechi, Feb.* 1.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House, in Hanover-square, on Wednesday last, the 6th of February. The following Members of Council and Governors were present: His Grace the Duke of Richmond K.G., Trustee, in the chair; Earl of Chichester, Hon. R. H. Clive, M.P., Hon. Capt. Dudley Pelham, R.N., M.P., Hon. H. W. Wilson, Sir Charles Lemon, Bart., M.P., Mr. Raymond Barker, Mr. Bramston, M.P., Mr. Brandreth, Col. Challoner, Mr. Foley, M.P., Mr. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Wren Hoskyns, Mr. Milward, Mr. Pendarves, M.P., Mr. Chandos Pole, Mr. Pusey, M.P., Prof. Sewell, Mr. Shaw (London), Mr. Villiers Shelley, Mr. Simpson, Mr. Slaney, M.P., Mr. Stansfield, M.P., Mr. H. S. Thompson, Mr. Hampden Turner, Mr. Thomas Turner, Prof. Way, and Mr. Jonas Webb. Charles Towneley, Esq., of Towneley, near Burnley, Lancashire, and Charles-street, Berkeley-square, London, was elected a Governor of the Society.

The following new members were elected:

More, R. B., Linley, near Shrewsbury
Bryant, James, Prospect, near Plymouth, Devon
Howard, J. P., 59, Mark-lane, London
Duntze, Sir John, Bart., Exleigh, Starcross, Devon
Clarke, Richard Hall, Bridwell, Collumpton, Devon
Fellowes, Robt., jun., Billeswall Hall, Lutterworth, Leicestersh.
Cole, Rev. N., South Brent, Ivybridge, Devon
Sparkes, John, North Bemfleet, Wickford, Essex
Burkill, Ed., Winteringham, Barton-on-Humber, Lincolnshire.

The names of 48 candidates for election at the next meeting were then read.

Finances.—Colonel Challoner, Chairman of the Finance Committee, presented to the Council the Report of the Committee on the accounts of the Society to the end of the month of January; from which it appeared, that the current cash balance in the hands of the bankers at that time was 3631*l.* He explained to the Council that this balance included the Exeter subscription of 1260*l.*; amount received for life-compositions, 1247*l.*; and on account of arrears of subscription from members, 1124*l.* The Committee recommend that this sum of 1247*l.*, received as compositions, should be invested as capital by the purchase of stock in the public funds. Colonel Chancellor further reported, on the part of the Committee, that 998 letters had been addressed and sent by post, to members who were more than 2 years in arrear of their subscriptions, claiming the sum of 5205*l.* as the amount of such arrears; that 446 of these members had returned answers to the application, 206 had paid their arrears, amounting to 808*l.*, while 552 persons had sent no answer whatever. He added that the Finance Committee would proceed to enforce the claim of the Society against these parties, in accordance with the instructions and order of the Council. The quarterly statements of income, expenditure, and liabilities, as well as that of the funded property of the Society, were laid on the table for the information of the Council.—The Council confirmed this report, and adopted the suggestion it contained for the investment of the balance on the life composition account.

Chemical Lectures.—The Report of the Chemical Committee having been read, the Council decided that Professor Way's offer to deliver a course of elementary lectures on chemical science before the members during the current year should be accepted, with their best thanks. It was arranged that the first lecture should be delivered in the Council-room of the Society at 12 o'clock on Wednesday, the 27th inst., all members of the Society having the privilege of being present on the occasion.

Meeting of 1851.—Mr. Pusey, M.P., having laid before the Council a communication from the Royal Commission for the Exhibition of the Products of Industry of all Nations in 1851, it was decided that the President should be requested to direct a special meeting of the Council to be summoned for Wednesday, the 20th inst., at 12 o'clock, for the purpose of taking such communication into consideration.

Mr. Shaw, of London, presented a coloured plan of the Islington Cattle Market; and took that opportunity of reporting the renewed outbreak of small-pox among the sheep in Norfolk.

Numerous communications for the weekly Council, and presents for the library, were received, with the thanks of the Council, which then adjourned.

Reviews.

Tax on Successions and Burdens of Land, &c. By P. B. Brodie, Esq., Barrister-at-Law. London: Longman and Co. 8vo, pp. 92.

The author of the essay now before us proposes that a tax should be imposed on all persons taking landed property by descent, and on those who come into the possession of personal property under marriage and other settlements; he also advocates the revival of the house-tax and the substitution of it, together with the two above-mentioned taxes on successions, in lieu of the present income-tax. With regard to the proposed tax on successions, Mr. Brodie justly observes that—

"Of all direct taxes perhaps none can be found less open to objection than a tax on successions. If a person, on his first coming into the enjoyment of property, pays a portion of it at once to the state, he would make the payment more willingly than if he were to be harrassed by the periodical visits of the tax-gatherer for payments of a portion of his income, to meet which he must be continually making sacrifices. The hardship of the tax which is only to be once paid can be nothing in comparison with the hardship of a tax which is to be continually recurring. It has also another decided advantage from its being taken out of property *in transitu*, before the new owner comes into the actual enjoyment of it. It is levied at the precise time when he acquires his fortune, or an increase of it. He has not, therefore, to contract his expenditure and diminish his enjoyments, or lessen his savings. He is only prevented from launching out into so great an expenditure or making such savings as his new acquisition would have warranted if the amount of the tax had not been deducted. In short, the withholding from him what he has never enjoyed cannot be compared to the deprivation, which a person may have to undergo, who may have to provide for the payment of any other direct tax. The severity of any other direct tax may, in some degree, be mitigated in process of time, after its imposition, by persons accommodating themselves to it, and may, after a lapse of time, be wholly done away with when the tax has become permanent, and the persons succeeding to land so taxed take the land subject to the tax, and have therefore never enjoyed it exempt from the tax. But even then, of the two direct taxes, a tax which is not to be periodically demanded, and is only to be paid at the time when the party who is to pay it has an acquisition of property, and has not had the actual benefit of such acquisition, must be the preferable tax of the two."

Mr. Brodie estimates the amount of personal property, settled in one year, including sums to be raised for portions under trusts in settlements of real property, to be about 8,000,000*l.*; the same sum may be considered as annually taken out of settlement, and might be made liable to a tax on successions. Such a tax, if levied similarly to the present probate and legacy duty, would amount to about 350,000*l.* annually, and would, according to the author's plan, be paid by the trustees of the settlement when the money settled came to be divided among the objects of the trust.

By a slight alteration in the probate and administration duty, namely, by making the duty on both 3*l.* per cent. on all sums of 300*l.* and upwards, by continuing the present rate of duty on probates for all sums under 300*l.*, and by making the administration duty for all sums under 300*l.* correspond with the probate duty, it is estimated that 600,000*l.* a year might be obtained, in addition to what is returned under the present system.

With a view not to press too hard on persons of the first degree, Mr. Brodie does not propose to increase the legacy duty of 1*l.* per cent. now charged on them. If, however, it were to be increased 1*l.* per cent., a sum considerably exceeding 200,000*l.* per annum would be added to the revenue. It is proposed to increase the legacy duty on persons in the second degree from 3*l.* to 4*l.* per cent., and also to increase that now paid by persons more distantly related to the deceased, and to strangers, Mr. Brodie very justly observing, that "there can be no event in which persons would less unwillingly pay a heavy tax than on the fortuitous acquisition of property."

Then with regard to landed property: "It is proposed that upon every succession to real property by the death of the previous owner, the duty should attach, and that the amount of duty should, as to the persons succeeding, be regulated according to the same five degrees of relationship as in regard to personal property, and that the amount in each degree should be as follows, viz.:—the first degree, one year's net income; the second degree, one year's net income, and one-half of a second year's net income; the third degree, two years' net income; the fourth degree, three years' net income; and the fifth and last degree, four years' net income. According to the above scale, the amount of the duty on real property will, on comparison, be found, as to the second, third, and fourth degrees, below the amount of the duty on probates and administrations and legacies, if increased as proposed."

The sum which could be thus obtained the author estimates at about 2,741,665*l.* The total amount of the additional tax on personal property and real property would be, then, 350,000*l.* for taxes on settlements of personalty, 600,000*l.* for probates and administrations, 415,432*l.* for legacies, and 2,741,665*l.* for real property, amounting altogether to 4,107,097*l.*

By reviving the old house tax an additional sum of about 1,500,000*l.* would annually be added to the revenue, and this sum, together with the last, would ex-

ceed 5,600,000*l.* a year, as nearly as possible the amount of the present income-tax, and might replace that tax.

Such is an outline of Mr. Brodie's plan—a plan which he has developed with great impartiality and clearness in the little work now before us, to which we must refer those of our readers who wish for further information on this subject, and a perusal of which we strongly recommend to all those who imagine that land is already over taxed in this country.

A Cyclopedia of Agriculture, Practical and Scientific, in which the Theory, the Art, and the Business of Farming are practically treated. By upwards of Fifty Farmers, Land Agents, and Scientific Men. Edited by John C. Morton. Blackie and Son, Warwick-square, London. Parts I. and II.

It does not seem inconsistent with propriety that we should give a descriptive notice of this work—though an opinion on its merits is, for obvious reasons, impossible here. The designed character of the publication is sufficiently indicated in the Prospectus which has already appeared in our advertising columns. How far it may attain the position at which it aims, remains to be seen. It differs from previous and cotemporary cyclopedias in the original character of its contents, and in the division of labour principle on which its authorship has been effected.

The first and current numbers contain articles by Drs. Lindley and Playfair, Messrs. Ball, Burns, Curtis, Gorrie, Grigor, Hannam, Hoskyns, Morton, Thomson, Walton, and Way—embracing several sections of the theory and details of farm practice. The work opens with an introductory essay on the History of the Art, in which the obstacles to improvement, and its consequent tardy progress, are discussed by Mr. Hoskyns. The articles Acclimatation, Farm Accounts, follow, commencing the alphabetical order of arrangement, which is continued up to the article Ashes, in the midst of which No. II. concludes.

Farmers' Clubs.

St. Peter's, *Jan.* 16*: Farm Costs.*—The following resolutions were passed unanimously : 1st, That, as the value of agricultural produce is greatly lessened, it is the opinion of this meeting that farmers in general should, and must adopt and carry out a system of vigilant and wise economy, extending even to every expense unavoidably incurred. And as those employed in trade are reaping considerable advantages from the cheapness of food, it is thought by all present that the tradesman will now be able (without injury to himself), to make a considerable reduction in his charges. It appears particularly desirable reductions should be made in this neighbourhood, as from various returns now before the meeting, it is evident that tradesmen's charges are even higher here than in most parishes around. It is therefore resolved that the tradesmen of this parish be requested and desired to reduce their charges to the following scale, viz.—Blacksmith's work about 2*l.* per horse, per annum ; including the entire work required on the farm, except new tires for carts and waggons, and new ploughshares ; or if the work is not done by contract, that the shoeing should be 6*d.* per shoe, and other charges in proportion. Collar and harness maker to about 10*s.* per horse. Carpenters and bricklayers to 3*s.* 6*d.* per day ; and Bricklayers' labourers to 2*s.* 2d, That this meeting feels the importance of endeavouring to maintain in health, honesty, and comfort, the agricultural labourer. And while the fulness of the labour-market, and the necessities of the farmer, would urge to a reduction of the labourers' wages to the lowest point, it is of opinion that means should be from time to time devised to employ as many hands as can possibly be employed with the hope of profit ; and that those employed shall be paid so as that their condition is not rendered worse by the altered state of things. 3d, That it is the opinion of this meeting that in too many cases, the agricultural labourer is charged too much rent for his cottage ; and that it appears desirable that pains should be taken to bring the matter before the landlords, with a view to effect a general reduction. *William Manser, Chairman, James Smeed, Secretary.*

Miscellaneous.

The Improvement of Chat Moss.—The drainage was the first step to improvement ; this was effected by cutting open parallel ditches 66 yards apart, 4 feet wide at the top, and sloping down to about 14 inches at the bottom, and 3 feet 6 inches deep : in a wet floating mass like this Moss it was not possible to sink the ditch to the whole depth at once, and the first two spits being taken out it was then left for time to consolidate the surface ; the covered cross-drains, 10 yards apart, laid 3 feet deep, and running into the open ditches, were commenced ; but in forming these, as well as the open drains, it was necessary to allow some time to elapse between the different operations, that the water might to some extent run off ; the hollow drain was made by the top sod, dried by exposure to the air, being wedged into the open cut, and the peat thrown in again upon that to fill up. When the surface was partially dried, the Heath and other plants growing upon it were set on fire and burnt off as closely as possible ; and by ploughing and cross-ploughing, and cutting up the sods with a roller armed with knives, the ingenious contrivance of Mr. Reed, he was enabled to destroy the tough and elastic character of the surface : after this process marl, which was found at the southern edge of the Moss, was, by means of a moveable railway, laid on the top, to the amount of 100 cubic yards to the statute acre ; the average distance which the marl had to be removed being about two-thirds of a mile. Whilst these operations were in progress, I went over the Moss with Mr. Reed, and remember that both men and horses were obliged to work with pattens, or flat pieces of wood, attached to the feet. By means of the Liverpool and Manchester Railway, then in full operation, Mr. Reed was enabled to bring from the latter town any quantity of manure, and he found that a mixture of night-soil and ashes was preferable to anything else. By growing a crop of Potatoes in the first instance, the different particles of moss, earth, and manure became so thoroughly blended together, that the soil formed would produce anything, and Wheat, Clover, and Oats followed each other in successful rotation. Since Mr. Reed left (some years ago), the management has been intrusted to Mr. Evans, now of the Haigh Foundry, Wigan, and it has been discovered by experience that it is not advisable to grow Wheat or Clover on such land : Turnips, Oats, and Potatoes are considered the best crops ; and instead of marl, which is both bulky and heavy to move, it is now ascertained that salt mixed with lime is the most effective instrument in destroying the mossy nature of the surface, and preparing it for a first crop of Potatoes ; these grow exceedingly well on moss lands unmarled, but if marled, their failure is as general as on other soils. *Mr. Garnett, in the Journal of the Royal Agricultural Society of England.*

Calendar of Operations.

FEBRUARY.

Bedfordshire Farm, *Feb.* 4.—Farm operations of late have generally been subservient to the weather. During the frost, our horses were principally employed in carting dung and "mixins" upon the land. Nearly 50 acres of Grass were dressed with mud and soap ashes, at the rate of about 20 tons per acre ; the proportion of soap ashes about one-sixth of the whole. The mixture had been several times turned, and is in a finely pulverised state when spread. The horses are now ploughing the Turnip land after sheep, part of which is intended for immediate sowing with early white Peas, and part for Oats. Some land is also being ploughed for spring Tares. We prefer sowing Oats, Peas, and Tares thick—little less than 4 bushels of each per acre, although the land is clean, and in good condition. Bean-setting has partially commenced. The usual price for planting by hand runs from 4*s.* to 5*s.* per acre. Our fatting cattle now receive a mixture of Swedes and Mangold Wurzels steamed, with hay and straw chaff, with Bean, Barley, and Linseed meal mixed. The store Beasts live chiefly upon Barley and Oat straw, with a portion of roots. The milch cows have hay, Swedes, and Carrots. Fatting sheep live upon roots, hay and straw chaff, with about a pound of corn each. The store sheep have a portion of roots, with chaff. Ewes and lambs get shelter in yards at night, and receive a mixture of Clover and Pea-chaff, with a few bruised Oats, all served in troughs. In the day time the ewes have a run in the Grass fields, and get some Mangold Wurzels to assist the milk. Mangolds require to be given with discretion at first, otherwise they do harm. An ordinary sized root to an ewe is quite sufficient to begin with. Mangolds, Turnips, Carrots, and Potatoes stored previous to or during the frost now require examining, and the injured roots picking out and consuming. Turning the apparently sound roots will do them much good for ultimate preservation. *R. V.*

Notices to Correspondents.

Bean-drills : *E L.* Messrs. Drummond, Stirling, N.B.

Bones : *M S.* Mix one bulk of bones, thoroughly wetted, with two bulks of ashes or sand. The two must be *mixed*, and they need not be under cover.

Chaff-cutter, &c. : *G W.* Gillett, of Brailes, near Stourbridge. We do not know Taylor's emigrants' flour-mill. Salt might be tried with possibility of advantage. But a thoroughly soaked soil will admit hardly anything *into* it.

Cochin China Fowl. Many genuine specimens have a few feathers on the legs or feet, or both ; others, equally true-bred, are clean-legged. The feathers in such cases are no *distinctive* mark, only an occasional appendage. *D.*

Cottage Chimney : *M P* desires to know how to construct one which shall not smoke. Will any one describe his experience in this matter.

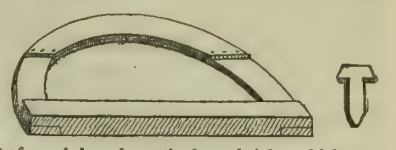
Distribution of Liquid Manure : *F H.* It can be effected only by water-cart, or pipe, or conduit of some kind cut in the surface of the land. A hand water-carriage might be obtained at no great cost ; if the extent to be manured is not too great for such small means. Or you might take advantage of your gentle slope to convey the water over its surface by furrows, as in a water-meadow.

East Ilsley : *Amicus.* Many thanks ; but the speech refers too exclusively to a political matter.

Emigration : *Henry* wants the names of works on New Zealand as a field for the emigrant.

Expense of Growing Wheat : *Falcon* says, perhaps some of our correspondents would kindly give their experience as to the cost of growing Wheat, per bushel, on various soils, mentioning the previous crop, and the probable value of the one succeeding the grain, as it generally follows that the gain on the produce of one crop compensates for the loss on another.

Farm Estimates : *Mr. Mechi* says, "The estimate of an Essex farm of 100 acres, quoted in your editorial article, is omissive and assumptive. True, the farmer pays rent for 100 acres, but only crops or derives the benefit of about 90, the other 8 or 10 being occupied by fences, ditches, headlands, roadways, and buildings. Should he continue to pay for these ?"



Horse-Hoe : *J K S.* We know of no good corn horse-hoe but Garrett's. The Bean-barrow is a Scotch implement : apply to Drummond, Stirling, N. B.

How to have Fresh-laid Eggs all Winter : *Anon.* In February or March set a broody hen, with a sitting of game eggs. The black-breasted reds I prefer. The pullets, if liberally fed, will begin to lay in September, and will continue laying through the winter. I have several hens which have been in an egg and have laid an egg in 20 weeks. If any of them should go broody after laying a nest of eggs, put it in a coop for two or three days, and reduce its food considerably. The hatching fever will then go off, when it may be released, and in about three weeks it will begin to lay again. I have practised this plan several years with invariable success. The fowls must be warmly housed and well fed. *Nomen fictitium.*

Hybrid Pheasants : *N F.* says, "I know two persons who tried 'L. V. R.'s' experiment last summer. Both experiments failed. I have closely enquired into many cases, but never yet could find indubitable proof that the pheasant will couple with the domestic hen."

Is the Neighbourhood of a Water-meadow Unhealthy ? *An Old Sub.* asks this question.

Liquid Manure Tanks : *A Constant Reader and Enquirer.* When clay is plentiful, a liquid manure tank may be made readily and cheaply, without mortar or mason. Make two centres and two wedges, similar to the drawing ; the backs of the centres should be of 3-inch scantling, and the bows of inch boards ; when these are placed together, back to back, with inch wedges between them, they will describe a circle, say of 6 feet. Dig a hole as for sinking a well, say 9 feet deep and 8½ feet in diameter ; cover the bottom with clay, well puddled, 9 inches thick ; lay the floor of your tank with bricks, flat ; describe on this area a circle of 6 feet 9 inches diameter ; on this place the centre, raising it 4½ inches from the floor ; set a circle of bricks on end round it ; put clay round the outside of the bricks ; tread and puddle it well ; drive here and there a pebble into the openings on the outer margin of the bricks, to make the arch firm ; trim your work by rapping those bricks into place, that, by the treading of the clay, have been driven out of upright ; knock out the wedges ; raise your centre, by loose bricks, 9 inches, and proceed with another circle of bricks as before. When you have arrived at the required height, remove the centres,—and your tank is finished. If you wish to cover it,

place a floor of rough boards on the loose bricks which supported the centre ; make a dome of earth, and on this an arched covering, with an opening for the pump, which should be large enough to admit a man and bucket, to clean out the tank when requisite. The arched covering should be with mortar, and may require a mason. Several of these tanks may be made to communicate ; and for this purpose, in one of your circles of bricks, near the bottom, three bricks should be placed horizontally on each other ; two of the perpendicular bricks on which the three rest can be taken out, and a communication 9 inches by 6 formed with the adjoining tank, taking care to puddle well the short drain between the two. Any parish school-boy ought to be able to calculate the number of bricks and cubical contents of the above tank.

Liquid Manure : *Henry.* The proportion of ammonia differs very much in different specimens. That is the only possible explanation of the difference.

Mud : *T K.* You had better lay it in a heap to dry, then break it down and mix it with lime and salt before application to Grass land. Mix in such proportions as that the quantity of mud you have per acre shall add 2 cwt. of salt and 30 or 40 bushels of lime. It is impossible to say what the value of it is.

Peruvian Barley : *Old Subscriber.* Sow it by all means. Since you have paid for it, give it a trial. We do not believe it to be materially different from the common naked Barley of the country.—*Messrs. Lee.* Your letter shall be answered next week.

Property-Tax : *A O G.* We have for some years declined answering legal questions. You must consult your solicitor.

Reed : *Hesperus.* You must obtain runners or stolons, and transplant early in spring.

Erratum.—At page 60, col. *b*, on "A Six Years' Rotation," for "W. Fowke, Hunley," read "W. Fowlie, Hursley."

*** Communications reaching town after Wednesday cannot be answered the same week.

Markets.

SMITHFIELD, Monday, Feb. 4.

The number of Beasts is large and the quality very good. Trade is very slow, at a reduction from the rates of Monday, and several remain unsold. The supply of Sheep is very small, still there are sufficient for the demand. We have a dull trade, and our top quotations are with difficulty realised. Good Calves continue to be scarce and dear. From Holland and Germany we have 121 Beasts, 590 Sheep, and 22 Calves ; from Scotland, 300 Beasts ; from Norfolk and Suffolk, 2200 ; and 400 from the midland counties.

Beasts, 3688 ; Sheep and Lambs, 16,020 ; Calves, 69 ; Pigs, 205.

Friday, Feb. 8.

We are well, although not abundantly supplied with Beasts ; the demand is very small, consequently trade is exceedingly dull, and it is with difficulty that Monday's rates are realised for choicest kinds. Several of inferior description remain unsold, notwithstanding there is a disposition to take lower prices. The number of Sheep is rather larger than of late. The dead market being pretty clean, they are readily sold at fully Monday's quotations. Good Calves are still scarce and dear. Some Dutch that arrived late in the day were sold rather lower. Trade is very dull for Pigs. From Holland and Germany there are 30 Beasts, 60 Sheep, and 76 Calves ; and 132 Milch Cows from the home counties.

POTATOES.—Southwark, Feb. 4.

The Committee report that the arrivals during the last week have been considerable, which, with a fair quantity from the Continent and very mild weather, has caused the demand to be heavy at the following prices :—Yorkshire Regents, 90s. to 130s. per ton ; Wisbeach do., 70s. to 100s. ; Scotch do., 70s. to 80s. ; Scotch cups, 60s. to 75s. ; French whites, 60s. to 80s. ; Belgian do., 60s. to 70s.

HOPS.—Friday, Feb. 8.

Messrs. Pattenden and Smith report that the market continues firm, with a better demand both for consumption and speculation, and should Mr. Cayley succeed in his motion for a total repeal of the malt duty (which stands for Tuesday week), we must have a considerable advance in the Hop market, particularly in yearling and old Hops, which at this moment are to be bought much under the cost of production.

COVENT GARDEN, Feb. 9.

The supply of Vegetables is pretty well kept up, and Fruit for the most part is sufficient for the demand, except Hothouse Grapes, Pears and Apples, which are scarce. Pine-apples are also less plentiful. Filberts and Walnuts are abundant, and Chestnuts plentiful. Oranges and Lemons are abundant, and there are some good Seville Oranges in the market. Amongst Vegetables, Turnips and Carrots are good, Cauliflowers and Broccoli sufficient for the demand. Potatoes are unaltered since our last account; foreign ones fetch from 50*s.* to 70*s.* a ton. Lettuces and other salading are dearer, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

Mint, per bunch, 9*d* to 1*s*

MARK LANE.

Monday, Feb. 4.—The quantity of Wheat on sale in Mark-lane this morning, by land carriage samples from Essex, Kent, and Suffolk, was small, and the arrivals coastwise were also limited. The condition of most of the samples was more or less affected by the late damp weather. Good dry parcels sold at last week's rates, but the general runs declined in value 1*s.* per qr. No alteration took place in the value of foreign Wheat, but the demand continues limited in the extreme. The nominal top price of town-made Flour remains unchanged; country and foreign marks were easier to purchase.—English Barley of all descriptions met with some little attention, and a further reduction had in some instances to be submitted to before progress could be made in sales. Foreign was also easier to purchase.—Oats were in moderate supply, and quite as dear as at the close of last week.—Beans and Peas were a dragging trade, and their value continues rather to decline.

Friday, Feb. 8.—The supplies of grain have been small during the week, caused probably in a measure by the late boisterous state of the weather, at the same time the demand for all articles of our trade has been limited in the extreme. The few parcels of English Wheat on sale were placed with difficulty at Monday's rates, and the value of foreign remains nominally the same.—Barley, Beans, and Peas, if anything, were rather easier to purchase.—Oats were sold in retail quantities to needy buyers, at full prices.—Indian Corn is dull, but few cargoes on sale at Falmouth or Queenstown.—Rye in less favour.

Arrivals this week.

Liverpool, Tuesday, Feb. 5.—The arrivals of Wheat have been moderate. During the past week the trade generally has been very inactive, and confidence seems to have left us. The business at our Corn Exchange this morning was again on a very moderate scale; indeed, so little was done in Wheat and Flour that it is hard to make an alteration in the prices of Tuesday. Oats declined ½*d.* to 1*d.* per bushel, and Egyptian Beans 1*s.* per qr. Barley and Peas were both much neglected. Indian Corn was 6*d.* per qr. cheaper.

GALVANISED WIRE GAME NETTING.—

7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,

1⅝-inch ,, light ,, ...	8 ,,	6 ,,
1⅝-inch ,, strong ,, ...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c., 22, Parliament-street, Westminster, London; Castle-Buildings, Derby-square, Liverpool; 128, High-street, Edinburgh; and 32, St. Enoch-square, Glasgow, beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost .. £3 15 0
Do. of 100 yards, 24 ins. wide 5 0 0
Do. of 100 yards, 30 ins. wide 6 5 0
Do. of 100 yards, 36 ins. wide 7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS and Co., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. Weeks and Co., King's-road, Chelsea.

EPPS' COLLECTIONS of KITCHEN GARDEN SEEDS.

No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ¼ oz. Buda Kale, 7 oz. Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pints Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. £3 3 0
No. 2, two-thirds of the above 2 2 0
No 3, one-third ditto 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. Epps with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

*** Cole's Superb Dwarf Red Celery, 1*s.* per packet.

"BROMHAM HALL" GREEN FLESH MELON, Is the finest flavoured in the World.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior Melon called "BROMHAM HALL" GREEN FLESH MELON, respectfully invites the attention of the public generally, to the superiority of this over all other Melons ever yet sent out. It was forwarded to the Editor of the *Gardeners' Chronicle*, July 22d, 1848, for his judgment, and he was of decided opinion that the Bromham Hall Melon was the finest flavoured fruit he had ever tasted. It was exhibited at the Chiswick Exhibition, July 11, 1849, where it was awarded by the judges the Silver Knightian Medal for the best flavoured green flesh Melon. It was again sent to Dr. Lindley, August 11th, 1849: "We have received your Bromham Hall Melon, it was much over ripe, nevertheless it was by far the best flavoured Melon we ever tasted." It was again exhibited at the Horticultural Society's Rooms, Regent-street, September 4th, 1849, and was again pronounced by the judges to be the best flavoured Melon they ever tasted, and was awarded the Banksian Medal. The fruit is very handsome—it is round shaped, hollow crown, beautifully netted, thin skin, flesh very firm and solid, melting flavour, very free setter, and abundant bearer. Weight, from 3 lbs. to 4½ lbs. It has been found to do well during the summer, without bottom heat. It may be as easily grown by an amateur in a frame as the common Vegetable Marrow. There is a great advantage in it for the fruiterer, as it will retain its fine flavour for a considerable time after being cut. Sold in packets of 6 seeds, 2*s.* 6*d.*; larger do. of 15 seeds, 5*s.* Also the following fine varieties can be highly recommended all true:

	s.	d.	
Queen Melon	1	6	per packet.
Bowood Green Flesh	1	0	,,
Beechwood do.	1	0	,,
Windsor prize do., 1*s.*; Emperor ..	1	0	,,
Fleming's Trentham Hybrid	1	0	,,
Duncan Green Flesh do. improved ..	1	0	,,
Hampton-court Green Flesh	1	0	,,
Egyptian do. do. improved	1	0	,,
FIRST PRIZE CUCUMBER, VICTORY OF BATH	2	0	,,
Gordon's White Spine	1	6	,,

These two Cucumbers are unequalled for their superiority for exhibition, having been thoroughly proved to the satisfaction of hundreds of growers. They will be found to grow as well out of doors on a ridge, or against a wall, during the summer months, as a common ridge Cucumber; also equally as productive. Length, from 20 to 26 inches.

N.B. It is with regret we state that numerous parties have been disappointed by purchasing an inferior variety under the name of Victory of Bath. E. T. begs to say it has proved not to be the true variety sent out by him.

Lord Keynon's Favourite (winter Cucumber), a very scarce variety. It is the best for winter cultivation ever yet grown; it is very hardy, and free setter, and never shanks off; fruit very handsome. Length, about 14 inches. 2*s.* 6*d.* per packet. A packet of each of the three varieties, 5*s.*; if preferred, also a packet of the Bromham Hall Melon will be included with the three Cucumbers for 7*s.*—Sold by Edward Tiley, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or 1*d.* postage stamps.

FERN SEEDS, &c.

GEORGE BENNETT begs to inform the lovers of FERNS, that he has purchased the entire stock of rare and valuable Fern Seed (sent home from New Zealand by the late Curator of the Sheffield Botanic Gardens), which he purposes selling at the reduced price of 2*s.* 6*d.* per packet (advertised in the Gardeners' Journal in August, 1849, at 10*s.* 6*d.* per packet). The names of the varieties are as follows: No. 1, Todea sp., variety Australis or Black Tree-fern; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata, fine silvery-leaved Tree-fern; No. 4, Mixed varieties of Hymenophyllum, Trichomanes, Adiantums, Aspleniums, Lomaria, Niphobolus, Pteris, Cyatheas; No. 5, Mixed varieties of Alsophylla dealbata or Silver Tree-fern.

G. B. has also a quantity of valuable Shells from the above country, as well as a variety of the seeds of Taxus sp., grows on the highest mountains in New Zealand. He has also for sale a valuable collection of rare specimens of Ferns in excellent preservation, of which printed Catalogues, with a list of prices, may be had on application to George Bennett, Brandon Lodge, near Coventry, Warwickshire.

A remittance must accompany the order, either in postage stamps or Post-office order, made payable at Coventry Post-office, to G. B., as above.

PLANTING SEASON.

ALFRED BALSTON begs to inform planters he has still a large proportion of his Nursery Stock to dispose of, which, in consequence of having relinquished the trade, he offers at very reduced prices. The Stock comprises every variety of ORNAMENTAL, FRUIT, and FOREST TREES, and all the best kind of SHRUBS in cultivation, no expence having been spared in the collection, and from the light nature of the soil in which it has grown, the plants have all a mass of fibrous root, which causes them to grow most luxuriantly after being transplanted.

A.B. particularly recommends the following: Common Laurel, 9 inches to 1 foot, 15*s.*; 1 to 2 feet, 30*s.*; 2 to 4 feet, 40*s.*; 4 to 6 feet, 80*s.* per 1000. Portugal Laurels, 1 to 2 feet, 10*s.* per 100. Rhododendron ponticum, 1 to 2 feet, 30*s.*; 3 to 4 feet, 60*s.*; 4 to 5 feet, 100*s.* per 100. Ghent Azaleas of all the finest kinds, specimen plants, 2*s.* 6*d.* each; smaller ditto, 6*s.* per dozen. Rhododendron campanulatum, caucasicum, catawbiensis, &c., 100*s.* per 100. Standard Roses of all the finest sorts, 12*s.* per dozen. A large stock of Evergreen Oak in pots and transplanted; also common Oak, Elm, Beech, Birch, Berberis, Hornbeam, Privet, &c.

Orders must be accompanied by remittances. Orders amounting to 5*l* delivered free.—Poole Nursery, Dorset.

Sales by Auction.

MESSRS. LODDIGES' CELEBRATED ARBORETUM FOR SALE BY AUCTION.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.

MR. J. C. STEVENS is favoured with instructions from Messrs. LODDIGES, of Hackney, to submit for unreserved competition, on the premises, on MONDAY, 4th March, and several following days, in consequence of the decease of the Senior Partner, the FIRST PORTION OF THEIR UNRIVELLED ARBORETUM, comprising many thousand well-grown specimens of the rarest and most beautiful Trees and Shrubs, affording to noblemen and gentlemen engaged in Ornamental Planting an opportunity which has never before occurred.—Catalogues are preparing, and will be ready for delivery 10 days prior to the sale, on the premises, and of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

TO NOBLEMEN AND GENTLEMEN ENGAGED IN ORNAMENTAL PLANTING, AND THE TRADE.

A large parcel of Araucaria imbricata, and Cedrus Deodara, two of the most noble Ornamental Trees ever introduced into Europe, and a few other hardy Coniferæ.

MR. J. C. STEVENS is directed to sell by Auction, at his Great Room, 38, King-street, Covent-garden, on THURSDAY, Feb. 21, at 11 for 12 o'clock precisely, 1100 Cedrus Deodara, 1 to 2 feet; 500 Araucaria imbricata, 1 foot to 18 inches; 12 fine specimens of Taxodium sempervirens, from 5 to 8 feet, and 100 strong plants 18 inches; 10 Taxodium pinnatum; 25 Pinus patula; 100 Cupressus torulosus; and 6 Gordon Island Cypress.—May be viewed the day prior and morning of sale, and Catalogues had (by enclosing a penny stamp) of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

BROMPTON PARK NURSERY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, &c.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. John Sangster, and Mr. Robert Donald, trustees to the above estate, to submit to an unreserved sale (as the whole must be cleared off on or before Lady-day next), a large portion of valuable stock still unsold, consisting of the well known celebrated collection of Standard, Dwarf, Maiden, and Trained Fruit Trees, and a rich assortment of Evergreens, Deciduous Shrubs, and Ornamental Trees; together with the Greenhouses, fitted up with new and improved Hot-water Apparatus. The sale to commence on MONDAY, the 25th February, and five following days, at 11 o'clock each day.—May be viewed prior to the sale. Catalogues (1s. each, returnable to purchasers) may be had of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. If sent by post, 1s. 6d. each.

AMERICAN PLANTS.

MR. D. A. RAMSAY has received instructions from an eminent firm to sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton, one mile from Hyde-park Corner, on WEDNESDAY, February 13, 1850, at 12 o'clock precisely, without reserve, 500 Rhododendrons, 2 to 4 feet, 150 Scarlet Rhododendrons, and other American plants, comprising Azaleas, Andromedas, Sedums, Ericas, &c.; 400 Standard, Dwarf, and Climbing Roses, a quantity of strong Vines and Fig Trees, Ilex Cunninghami, Cupressus, Daphne, Pinus, Garrya elliptica, Lycium horridum, &c.; a quantity of Ornamental Trees and Shrubs, comprising Scarlet Chestnut, Ailanthus, Thorn, Weeping Cherry, American Willow, Tulip Tree, &c.; Ribes, Caragana, Cotoneaster, Benthamia, Cytissus, Hibiscus, &c.; with other miscellaneous stock, comprising Pyrus japonica, Clematis, and other creepers; Victoria Rhubarb, Asparagus, Ash-leaved Kidney Potatoes, and a quantity of Bulbs and Bulbous Roots.—May be viewed the day prior and morning of sale, and Catalogues had at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

CHELSEA.

TO GENTLEMEN, NURSERYMEN, BUILDERS, and Others.

MR. D. A. RAMSAY has been favoured with instructions from Messrs. Wm. Dennis and Co., to sell by Auction, on the premises, King's-road, Chelsea, opposite Cremorne Gardens, on MONDAY, February 25th, 1850, and two following days, at 12 o'clock, each without reserve (to clear the land taken for building purposes), a large portion of the NURSERY STOCK, comprising a quantity of Aucuba, Holly, Box, and other Evergreens; Mulberry trees of all sizes; the prize collection of Gooseberries; the new silver-striped Ivy; large Irish Ivies; yellow Jasmine and other Creepers; a quantity of ornamental trees and shrubs; a choice collection of standard Plums and other Fruit trees, with a quantity of Moss Rose stools and layers, and other Roses in choice varieties; also a quantity of Camellias, Azaleas, Geraniums, Aloe, Yucca, &c.—May be viewed two days prior to the Sale, and Catalogues had (6d. each, returnable to purchasers) on the premises; at the principal Seed-shops; and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

THE STOCK OF A FLORIST.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde Park Corner), on WEDNESDAY, Feb. 19, 1850, at 12 o'clock precisely, without reserve, a quantity of large specimens of Camellia, Erica, Azalea indica, Acacia armata, Epacris, &c.; with 1500 Greenhouse Plants, in choice variety, comprising Camellia, Oleander, Epacris, Azalea, Crassula, Corræa, Cytissus, and other Plants in bloom; and also 300 Standard and Dwarf Roses.—May be viewed on the morning of Sale, and Catalogues had of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

COCHIN CHINA FOWLS.—New-laid Eggs for setting may be had by applying by letter, post paid, to W. O., at Mr. McLachlan's, 6, Birchin-lane, Lombard-street, London.

IMPORTANT TO MILLERS AND OTHERS.

TO BE LET, with immediate possession, in the neighbourhood of Bristol, a FLOUR MILL, of excellent construction and unrivalled situation, driving four pairs of French stones, combining advantages in transit of goods both by rail and water scarcely equalled. The whole new and in full work. Any one wishing to treat for the above is requested to apply by letter, post-paid, to G. F., at Mr. Symes', Cheese Factor, Temple-street, Bristol.

TO BE SOLD, OR LET, under peculiar circumstances, and upon very advantageous terms, a series of Forcing and Succession GRAPERIES, PEACH and PLANT HOUSES, upon which a large sum has been expended to bring them into a high state of bearing. To a purchaser, any reasonable accommodation will be given for payment.—Apply to Mr. PARSONS, Auctioneer and Estate Agent, 30, Marine-parade, Brighton.

TO BE LET for a term of 7, 14, or 21 years, and entered upon immediately, NORTHFLEET GREEN FARM, situate in the parish of Northfleet, Kent, containing 136 acres (more or less) of superior, dry, Arable and Hop Land, with suitable Dwelling-house and Agricultural Buildings. The incoming tenant will enter without valuation.—For particulars apply to WALTER D. JONES, Esq., Lancyck, near Newcastle Emlyn, Wales; and, to view the Farm, to J. BEESCHLEY, Esq., Wombwell-hall, near Gravesend, Kent.

TO NURSERYMEN AND SEEDSMEN.

TO BE DISPOSED OF, in consequence of the recent decease of Mr. JOHN RONALDS, of Brentford, the old-established and extensive BUSINESS OF MESSRS. HUGH RONALDS AND SONS, of that place.—For particulars, apply on the premises; or to Mr. E. RONALDS, 109, Upper Thames-street; or to Mr. G. B. TOWNSEND, Accountant, 49, Leadenhall-street, London.

SUPERB RANUNCULI.—The present being the usual month for planting, we beg to recommend the following. The new varieties have been selected with great care, of first rate sorts, from immense quantities of seedlings; and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.

RANUNCULUS.—Free by post.	£	s.	d.
50 Splendid new varieties, with names	2	0	0
25 do. do. do.	1	2	0
50 Fine older varieties, do.	0	15	0
25 do. do.	0	8	0
100 Finest mixed	0	10	0
100 Fine mixed, 5s.; or free by post for	0	6	0

A Descriptive Catalogue of the seedling varieties may be had. Remittances are expected from unknown correspondents.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

PLANTING SEASON.—NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON.—An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., NURSERYMAN AND CONTRACTING PLANTER.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting or immediate effect, from 3 to 12 feet, the prices varying from 25s. to 5l. p. 100.

Ash, Beech, Birch, 15s. to 30s. per 1000; Spanish Chestnut, 20s., 30s., and 40s.; Larch Fir, 7s. 6d. to 20s.; Spruce, 20s., 30s., and 40s.; Scotch, 10s., 15s, and 20s.; Pinaster, 10s., 15s., and 20s.; Sea Pine, adapted for exposure to the sea, 15s., 25s., and 40s.; Mahonia, for cover, 40s. to 80s.; Hazel, 15s., 20s., and 35s.; English Oak, 15s., 20s., and 40s.; Poplar, 20s., 30s., and 40s.; Quicks, 5s., 7s. 6d., and 10s.

Planting contracted for to any extent from 5l. to 20l. p. acre.

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20s., 40s., and 80s. per 1000; 1 foot, single stems, fit for working, 10s. per 100; 1½ to 2 feet, strong, 20s. to 40s. per 100, fit for planting out at once to cover; 4 to 6 feet, single stem, for working the beautiful scarlet and other fine kinds, 50s. per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18s. per dozen; hybrid scarlet, blue, lilac, and white, with large handsome trusses of flowers, 4 to 6 inches, 25s.; 1 foot, 40s. per 100; Kalmia latifolia, 2 to 4 inches, 8s. to 12s. 6d. per 100; 1 to 2 feet, blooming buds, 50s. per 100; 2 to 3 feet, fine, 75s. per 100; Epigæa repens, 50s. per 100; and all other American plants at equally low prices.

Dwarf Rose Stocks for working, 8s. per 100; Single Camellias, 25s., 40s., and 50s. per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12s. per dozen; Pinus (Abies) Douglasi, from seed, 6 to 9 inches, 10l. per 100 or 30s. per dozen; Arbutus, 6 to 12 inches, 8s. to 12s. per 100; 1 to 1½ foot, 20s. per 100; 2 feet, 30s. per 100; Laurel, 8s. to 20s. per 100; Laurustinus, bedded, 40s. per 1000, 8s. per 100; Variegated Holly, 1 foot, 25s. per 100; Clematis azurea grandiflora, 6s. per dozen, 42s. per 100; Deutzia scabra, 2 feet, 12s. 6d. per 100; Common China Rose, 12s. 6d. per 100; Tree Roses of the most select kinds, 5l. per 100; Dwarf Roses, 50 sorts, named, 50s. per 100; Double White, Double Red, and New Crimson Thorns, 40s. per 100, 6s. per dozen; Large Dutch Honeysuckles, 12s. 6d. per 100; Giant Irish Ivy, 8s. per 100.

The prices are for wholesale, if ordered in less quantities a higher price will be charged. All orders above 5l. carriage paid to London.

American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American Steam-packets take their departure, thus saving the delay and expenses of Land Carriage.

MESSRS. J. AND H. BROWN'S CATALOGUE for 1850, contains all that is new and useful in Exotic and Hardy Plants and Shrubs. Sent free by post for six stamps. Orders for any of the following are respectfully solicited.

Vegetable and Agricultural Seeds supplied in large or small quantities.—Albion Nursery, Stoke Newington, London, Feb. 9.

COLE'S SUPERB SOLID RED CELERY.—This fine Celery has given such entire satisfaction, not only for the great size to which it attains, but for its unequalled crispness and exquisite nut-like flavour, that it needs no further recommendation. Seed may be had genuine from the grower, WILLIAM COLE, Dartford, Kent, in sealed packets, 1s. 6d. each, or the amount in postage stamps; also of Messrs. J. and J. FRAZER, Leyton, Essex; Mr. BUNYARD, Maidstone, Kent; Mr. CRIPPS, Tunbridge Wells, Kent; Mr. DENYER, 82, Grace-church-street, London; Mr. TILEY, 16, Pulteney-bridge, Bath; Mr. FRANCIS, Hertford; Mr. MILNER, Bradford, Yorkshire; Messrs. J. and J. FAIRBAIRN, Clapham, near London; Messrs. GARAWAY, MAYES, and Co., Bristol; and of Mr. SMITH, Westerham, Kent; Mr. PONTEY, Nurseryman, Plymouth; and Mr. IVERY, Nurseryman, Peckham, Surrey; Messrs. ARCHIBALD WOOD and Co., Nurserymen and Seedsmen, Worcester; and Mr. POPE, Nurseryman, Gib Heath, near Birmingham.

*** A liberal allowance to the trade.

W. COLE further states, in justice to himself and agents, that his entire stock of seed saved in 1849 is in his possession and that of his agents, from whom it may be had new and genuine, bearing his name and address printed on the envelope.

FRUIT TREES AND SHRUBS AT HALF PRICE, NOW ON SALE FOR FOUR WEEKS, BY WILLIAM E. RENDLE AND CO., PLYMOUTH.

In consequence of the South Devon Railway Company having taken away a large portion of our Union-road Nursery, we are compelled to make some EXTENSIVE ALTERATIONS, *and as the whole of the ground must be cleared within four weeks, we have come to the determination of offering the stock at* HALF *the usual prices.*

PEACHES, NECTARINES, and APRICOTS.—Dwarf trained trees, 2s. 6d. each; smaller ditto, 1s. 6d. each; nice cut backs, 1s. each. A few very large trained trees in a bearing state, from 5s. to 7s. 6d. each, comprising Royal George, Noblesse, Chancellor, Newington, and some of the best sorts in cultivation.

PEARS.—Several hundred fine round-headed trees at 1s. 6d. each, worth 3s. 6d. and 5s. each, comprising all the best sorts in cultivation.

GRAPE VINES.—All the best sorts, 4 to 6 feet, 1s. 6d. each.

ARBUTUS.—Fine plants in pots, 12 to 18 inches, 5s. per doz.

ILEX OAK.—Fine plants in pots, and bushy, from 15 inches to 24 inches in height, 5s. per dozen, worth 1s. each. Four-year-old seedlings, out of boxes, SIXPENCE per doz.

BOX EDGING, 3d. per yard.

RASPBERRIES, "RENDLE'S LARGE BEEHIVE."—This is a large handsome variety, very prolific, and delicious flavour, and has given the most complete satisfaction. Strong Canes, 20s. per 100, or 3s. per doz. "YOUELL'S FASTOLFF," 10s. per 100.

CEDARS OF LEBANON.—We have a large stock of these in pots. Good plants, 3 feet, 36s. per dozen. Large handsome plants in pots, 4 to 6 feet, 5s. each; or one quarter the price usually charged.

BLACK NAPLES CURRANTS.—Very superior to the old sort, 6s. per dozen.

GOOSEBERRIES.—Some of the very best varieties in cultivation, 30s. per 100.

PORTUGAL LAURELS.—An immense stock will be sold unusually low. Fine plants, 18-inch, bushy, 20s. per 100; 3 feet, 30s. per 100; 4 feet, 40s. per 100.

BERBERIS, or MAHONIA AQUIFOLIA.—A very large quantity, 18 inches, 16s. per 100. This is a fine shrub for underwood.

Weigela rosea, strong plants, 12 inches, 6s. per dozen; Parnettia mucronata and floribunda, 6s. per doz.; Ribes, double red, and albidum, strong plants, 18 inches, 9s. per dozen.

Remittance, or reference in London, from unknown correspondents.

All orders above 5l. will be delivered free of carriage to any of the stations on the South Devon, Bristol and Exeter, or Great Western Railways. Steamers from this port to London, Dublin, Cork, Falmouth, Belfast and Glasgow, three times a week.

The South Devon Railway is now open to Plymouth, the Station being adjoining our premises. For Catalogues, and further information, apply to

WILLIAM E. RENDLE and Co., Union-road, Plymouth.

FIRST ORDERS WILL HAVE THE PREFERENCE; AS THEY WILL BE EXECUTED IN STRICT ROTATION.

ESTABLISHED 1786.

No. 1, 2l. 2s. No. 2, 1l. 1s. No. 3, 12s. 6d.

Reading Seed Warehouse, Reading, Berks.

TO THE TRADE.

BERNARD SAUNDERS, NURSERYMAN, &c., Jersey, begs to inform the Seed Trade that he has for sale a small quantity of that best of all PEAS for a late crop, the BRITISH QUEEN, at a moderate price, for cash. This Pea first originated in Jersey, and was sent out by B. S., and may be depended on as being genuine. Early orders are requested, as the stock is small. B. S.'s collections of Dwarf Apples and Pears stand unrivalled in the Channel Islands, and may be relied on as being correct to name, having had 40 years' experience in their correction and cultivation; Catalogues of which may be obtained on prepaid application.

N.B.—This Advertisement will not be repeated.

ON SALE BY THE SUBSCRIBER.—500,000 2-year Seedling Scotch Firs, superior plants, from native Highland seed, at 6s. per 1000; 500,000 2-year Seedling Larch; 200,000 3-year Seedling Black Norway Spruce; 200,000 transplanted ditto; a very extensive stock of Fancy Pines, viz., Excelsa, Pallasiana, Banksia, Fraserii, Nobilis, Grandis, Taurica, Webbiana, Pindrow, Lambertiana, &c.; some fine large specimens of Cedrus Deodara and Araucaria imbricata, &c.; a large stock of Irish Yews, from 5 to 10 feet high; with a very extensive stock, all sorts and sizes, of Nursery Stock in general.

JAMES ROY, Jun., Ferry-hill Nurseries, Aberdeen, Feb. 9.

FRUIT TREES, FLOWER-BEDS, &c.—Garden Netting, of superior quality, for preserving Fruit trees from frost, blight, and birds, or as a fence for rabbits, fowls, pigeons, Tulip and Seed beds, can be had in any length or quantity at 3d. per yard 2 yards wide, or 6d. per yard 4 yards wide, from JOHN KING FARLOWS, Fishing Rod and Net Manufactory, 5, Crooked-lane, London-bridge. The netting being tanned will stand exposure to the weather for many years. Forwarded to any part of the kingdom on receipt of post-office order, or reference in town. An allowance to gardeners and large consumers.—Copy the Address, 5, Crooked-lane, London-bridge.

JOHN KERNAN

4, GREAT RUSSELL STREET, COVENT GARDEN, 1850.

Begs to offer a Select List from his

24 papers of Hardy Annuals, 5*s.*
Seeds selected and carefully packed for North and South America, India, New Zealand, and Australia, in the most secure way to arrive safe at any of the above places.

Where a post-office order accompanies an order for any of the above-named Seeds, J. KERNAN will allow, as discount, additional articles to the amount of 2*s.* in the pound.

Ladies and Gentlemen relying upon the judgment and experience of JOHN KERNAN, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to the amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.

Old meadow turf, which will take a considerable time to decompose and char by the regular or natural means, may be produced by the following simple and short process. Place four bricks, raised two on two, about 3 feet distant from four others similarly arranged, upon which place a sheet of iron large enough to rest fully on the bricks. By making a fire under this simple machine, and allowing your turf to remain until charred, it will, when bruised, make an excellent stimulant for Annuals, Herbaceous and Pot Plants of all sorts. If the vermin or the season do not disturb them, you will not require more than one plant in a hundred of those that come up. Be careful to begin thinning when the plants are quite young.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, FEBRUARY 9, 1850.

Reading Seed Warehouse, Reading, Berks., Feb. 16.

RENDLE'S TRUE WILLCOVE BROCCOLI.—*This superior variety has been proved by thousands to be the best late sort in cultivation, and can be recommended with much confidence. We have saved a small quantity this season on our own grounds, from some of the finest heads ever seen; price* 1*s. per packet, free by post.*

*** Twenty packets to the Trade for 12*s*, or 50 for 2*l.* 10*s.* It will give the most complete satisfaction.

Our commercial stamp is on each packet.

COLE'S SUPERB RED CELERY, 1*s.* per packet.
Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

FRUIT TREES AND SHRUBS AT HALF PRICE, NOW ON SALE FOR FOUR WEEKS, BY WILLIAM E. RENDLE AND CO., PLYMOUTH.

In consequence of the South Devon Railway Company having taken away a large portion of our Union-road Nursery, we are compelled to make some EXTENSIVE ALTERATIONS, *and as the whole of the ground must be cleared within four weeks, we have come to the determination of offering the stock at* HALF *the usual prices.*

PEACHES, NECTARINES, and APRICOTS.—Dwarf *trained* trees, 2*s.* 6*d.* each; smaller ditto, 1*s.* 6*d.* each; nice cut backs, 1*s.* each. A few very large trained trees in a bearing state, from 5*s.* to 7*s.* 6*d.* each, comprising Royal George, Noblesse, Chancellor, Newington, and some of the best sorts in cultivation.

PEARS.—Several hundred fine round-headed trees at 1*s.* 6*d.* each, worth 3*s.* 6*d.* and 5*s.* each, comprising all the best sorts in cultivation.

GRAPE VINES.—All the best sorts, 4 to 6 feet, 1*s.* 6*d.* each.

ARBUTUS.—Fine plants in pots, 12 to 18 inches, 5*s.* per doz.

ILEX OAK.—Fine plants in pots, and bushy, from 15 inches to 24 inches in height, 5*s.* per dozen, worth 1*s.* each. Four-year-old seedlings, out of boxes, SIXPENCE per doz.

BOX EDGING, 3*d.* per yard.

RASPBERRIES, "RENDLE'S LARGE BEEHIVE."—This is a large handsome variety, very prolific, and delicious flavour, and has given the most complete satisfaction. Strong Canes, 20*s.* per 100, or 3*s.* per doz. "YOUELL'S FASTOLFF," 10*s.* per 100.

CEDARS OF LEBANON.—We have a large stock of these in pots. Good plants, 3 feet, 36*s.* per dozen. Large handsome plants in pots, 4 to 6 feet, 5*s.* each; or one quarter the price usually charged.

BLACK NAPLES CURRANTS.—Very superior to the old sort, 6*s.* per dozen.

GOOSEBERRIES.—Some of the very best varieties in cultivation, 30*s.* per 100.

PORTUGAL LAURELS.—An immense stock will be sold unusually low. Fine plants, 18-inch, bushy, 20*s.* per 100; 3 feet, 30*s.* per 100; 4 feet, 40*s.* per 100.

BERBERIS, or MAHONIA AQUIFOLIA.—A very large quantity, 18 inches, 16*s.* per 100. This is a fine shrub for underwood.

Weigela rosea, strong plants, 12 inches, 6*s.* per dozen; Parnettia mucronata and floribunda, 6*s.* per doz.; Ribes, double red, and albidum, strong plants, 18 inches, 9*s.* per dozen.

Remittance, or reference in London, from unknown correspondents.

All orders above 5l. will be delivered free of carriage to any of the stations on the South Devon, Bristol and Exeter, or Great Western Railways. Steamers from this port to London, Dublin, Cork, Falmouth, Belfast and Glasgow, three times a week.

The South Devon Railway is now open to Plymouth, the Station being adjoining our premises. For Catalogues, and further information, apply to

WILLIAM E. RENDLE and Co., Union-road, Plymouth.

FIRST ORDERS WILL HAVE THE PREFERENCE; AS THEY WILL BE EXECUTED IN STRICT ROTATION.

ESTABLISHED 1786.

PLANTING SEASON.—NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON. — An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., NURSERYMAN AND CONTRACTING PLANTER.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting or immediate effect, from 3 to 12 feet, the prices varying from 25*s.* to 5*l.* p. 100,

Ash, Beech, Birch, 15*s.* to 30*s.* per 1000; Spanish Chestnut, 20*s.*, 30*s.*, and 40*s.*; Larch Fir, 7*s.* 6*d.* to 20*s.*; Spruce, 20*s.*, 30*s*, and 40*s.*; Scotch, 10*s.*, 15*s.*, and 20*s.*; Pinaster, 10*s.*, 15*s.*, and 20*s.*; Sea Pine, adapted for exposure to the sea, 15*s.*, 25*s.*, and 40*s.*; Mahonia, for cover. 40*s.* to 80*s.*; Hazel, 15*s.*, 20*s.*, and 35*s.*; English Oak, 15*s.*, 20*s.*, and 40*s.*; Poplar, 20*s.*, 30*s.*, and 40*s.*; Quicks, 5*s.*, 7*s.* 6*d.*, and 10*s.*

Planting contracted for to any extent from 5*l.* to 20*l.* p. acre,

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s.* per 100; 1½ to 2 feet, strong, 20*s.* to 40*s.* per 100, fit for planting out at once to cover; 4 to 6 feet, single stem, for working the beautiful scarlet and other fine kinds, 50*s.* per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18*s.* per dozen; hybrid scarlet, blue, lilac, and white, with large handsome trusses of flowers, 4 to 6 inches, 25*s.*; 1 foot, 40*s.* per 100; Kalmia latifolia, 2 to 4 inches, 8*s.* to 12*s.* 6*d.* per 100; 1 to 2 feet, blooming buds, 50*s.* per 100; 2 to 3 feet, fine, 75*s.* per 100; Epigæa repens, 50*s.* per 100; and all other American plants at equally low prices.

Dwarf Rose Stocks for working, 8*s.* per 100; Single Camellias, 25*s.*, 40*s.*, and 50*s.* per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12*s.* per dozen; Pinus (Abies) Douglasi, from seed, 6 to 9 inches, 10*l.* per 100 or 30*s.* per dozen; Arbutus, 6 to 12 inches, 8*s.* to 12*s.* per 100; 1 to 1¼ foot, 20*s.* per 100; 2 feet, 30*s.* per 100; Laurel, 8*s.* to 20*s.* per 100; Laurustinus, bedded, 40*s.* per 1000, 8*s.* per 100; Variegated Holly, 1 foot, 25*s.* per 100; Clematis azurea grandiflora, 6*s.* per dozen, 42*s.* per 100; Deutzia scabra, 2 feet, 12*s.* 6*d.* per 100; Common China Rose, 12*s.* 6*d.* per 100; Tree Roses of the most select kinds, 5*l.* per 100; Dwarf Roses, 50 sorts, named, 50*s.* per 100; Double White, Double Red, and New Crimson Thorns, 40*s.* per 100, 6*s.* per dozen; Large Dutch Honeysuckles, 12*s.* 6*d.* per 100; Giant Irish Ivy, 8*s.* per 100.

The prices are for wholesale, if ordered in less quantities a higher price will be charged. All orders above 5*l.* carriage paid to London.

American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American Steam-packets take their departure, thus saving the delay and expenses of Land Carriage.

SAFFRON WALDEN.
SUPERB COLLECTION OF DOUBLE HOLLYHOCKS.

WILLIAM CHATER has a large and healthy stock of his unequalled collection of this splendid flower, and can supply good strong plants that will bloom well next autumn. For particulars, see printed Catalogue, which may be had on application by enclosing a postage stamp. Plants warranted true to name. A remittance requested on delivery of plants.

Post-office orders to be made payable at Saffron Walden.

NEW STRAWBERRY, "STIRLING CASTLE PINE."—The Subscriber begs to intimate that he has purchased the Stock of the above from the raiser, Mr. LAING, of Stirling. Its principal characters are as follows: Size of fruit large, classing with Keens' Seedling, British Queen, &c.; form somewhat irregular, inclining to conical; colour pale red, or scarlet when fully ripe; flavour excellent, partaking of that of the old Red Pine. It is also very prolific. Having been raised in 1846, it has now been thoroughly proved, and the following notices of it, selected from many others, will, it is hoped, be a sufficient guarantee for its superior merits:

"We recommend Mr. Laing to propagate this variety, and advertise it, as, from the specimens submitted to us, we consider it a most valuable addition to this useful family of fruits."—*Mr. Macintosh, in North British Agriculturist of Aug.* 1.

"This Strawberry seems to be an abundant bearer; fruit large, juicy, and highly flavoured. It may rank as a first-class fruit, will succeed the Keens' Seedling, and prove an excellent market variety."—*Mr. Macnab, in Report of Caledonian Horticultural Society.*

Plants can now be sent out, 20*s.* per 100, or 3*s.* per doz. Post-office orders or references required from unknown correspondents. Agents in London, Messrs. Hurst and M'Mullen, 6, Leadenhall-street; and in Dublin, Messrs. Drummond, 58, Dawson-street.—ROBERT M. STARK, Edgehill Nursery, Edinburgh.

*** Not to be repeated.

TO PEAR GROWERS.

RENÉ LANGELIER, St. Helier, Jersey, begs to state that he has still to dispose of, Trees of BEURRE ST. HELIER, a very valuable sort for its long keeping and melting qualities. Also BEURRE DELAVAL, as well as GABOURELLE SEEDLING, which is a great bearer, and fit for kitchen use.

R. L. wishes to draw the attention of amateurs to his unrivalled Collection, of which the trees are of unusual vigour. R. L. can meet any orders for what has been before advertised in this Paper.

FRUIT TREES (CARRIAGE FREE).—FULL TRAINED PEACHES, NECTARINES, APRICOTS, PEARS, PLUMS, CHERRIES, AND APPLES.

JOHN SUTTON AND SONS, Reading, Berkshire, are sending out SEEDS daily to almost every part of the Kingdom, and beg to inform their friends that they have a very first-rate collection of FRUITS in their Nurseries, which will be found as excellent as their Seeds, and are offered on as economical terms. Also all the best Perpetual Roses.

Priced Nursery Catalogues, gratis, on receipt of two stamps; and Priced Seed Catalogues, one stamp, for postage.

BROMHAM-HALL GREEN-FLESH MELON IS THE FINEST FLAVOURED IN THE WORLD.

EDWARD TILEY having become possessed of the whole stock of Seed of that very superior MELON called "BROMHAM-HALL GREEN-FLESH MELON," he is now sending out good sound Seeds at 2*s.* 6*d.* per packet of 6 seeds; larger do. of 15 seeds, 5*s.* per packet. For further particulars of the above, see Advertisement in this Paper, February 9th. Also the following fine varieties can be highly recommended:

	s.	d.	
Queen Melon	1	6	per packet.
Bowood Green-flesh	1	0	"
Beechwood do.	1	0	"
Windsor Prize do.	1	0	"
Emperor	1	0	"
Fleming's Trentham Hybrid	1	0	"
Duncan's Green-flesh do. improved	1	0	"
Hampton-court Green-flesh	1	0	"
Egyptian do. do. improved	1	0	"

FIRST PRIZE CUCUMBERS.

Victory of Bath	2	0	"
Gordon's White Spine	1	6	"
Lord Kenyon's Favourite	2	6	"

A packet of each of the three varieties, 5*s.*; if preferred, also a packet of Bromham-hall Melon will be included with the three Cucumbers for 7*s.*

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath. A remittance must accompany the order, either in cash or penny postage stamps.

TO PLANTERS.

W. DRUMMOND AND SONS, Stirling, have this season a large Stock of FOREST TREES, of fine quality, which they are offering at reduced prices. The Plants, from the free soil and exposure of their Nursery Grounds, are well rooted and hardy.

Priced Lists, including Shrubs and Fruit Trees, sent post free, on application.

N.B.—Priced Lists also of Seeds and Agricultural Implements sent free if required.—Stirling, Feb. 16.

SEED POTATOES.

CHARLES SHARPE has much pleasure in announcing that he has got the under-mentioned sorts of POTATOES to offer again this season, which have for the last four successive years given general satisfaction in all parts of the kingdom. The first six sorts are very early and productive; those marked thus * are the best sorts for Frame Forcing; they are offered at the following prices, packing included:

Per bushel of 56 lbs.		Per bushel of 56 lbs.	
*Early Oxford Potatoes	8*s.*	Early Manleys	7*s.*
*Early Round Frame	8*s.*	Early Cockneys	7*s.*
Early Ash-leaved Kidney	8*s.*	Fox's Seedling	7*s.*

Second Early Potatoes for Winter and Spring use:

American Native Potatoes	5*s.*	Kentish Pink Kidney	4*s.*
York Regents	5*s.*	Forty Fold	4*s.*

Orders will be forwarded on the receipt of a Post-office order, and great care will be taken to ensure their safe delivery. A liberal allowance to the Trade.—Wisbeach, Cambridgeshire.

SAMUEL FINNEY AND CO.'S NEW CATALOGUE OF SEEDS is now ready, and will be forwarded gratis on the receipt of two penny stamps for postage. In forming our Collections of Seeds we have taken special care to include all the select and most approved kinds, and such as we can confidently recommend.

Of VEGETABLE SEEDS, our Collections contain a full supply of all that is requisite for the largest establishment, and the kinds and quantities for each collection are stated. No. 1, 2*l.* 10*s.*; No. 2, 1*l.* 10*s.*; No. 3, 1*l.*; and No. 4, 12*s.* 6*d.*

Of FLOWER SEEDS, we have included all the most choice and showy kinds, particularly those we know to succeed well in the north, and a full list of all the best kinds of German Seeds, imported direct in sealed packets, with prices.

A Collection of 100 packets of the best hardy and half-hardy kinds for ...	...	...	...	...	15*s.* 0*d.*
Ditto of 50	ditto	ditto	ditto	...	8 0
Ditto of 25	ditto	ditto	ditto	...	5 0

We particularly recommend this Catalogue to residents in the north, as they will be enabled to purchase to advantage. All orders delivered free of carriage at any of the railway stations between Newcastle and York, Berwick and Carlisle, and by steam-boat to London, Hull, Whitby, Leith, Dundee, and Aberdeen. Railway and water communication to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead, near Newcastle-on-Tyne.

ORANGE, LEMON, LIME, CITRON, AND SHADDOCK TREES.—The first importation of the above Trees, in most excellent and healthy condition, has arrived from Italy. They are from 2 to 4 feet high in the stems, very straight, and possess strong grafts, and will make splendid trees in two or three years; from 12*s.* to 25*s.* each. They may be seen at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, London. Also Catalonian, Azorian, and Arabian Jessamine Plants. The Double Italian Tuberose Roots are still on sale, 4*s.* per dozen.

MITCHELL'S ROYAL ALBERT RHUBARB still has its supremacy over all other kinds for its extraordinary earliness, delicious flavour, and splendid red colour; also a most prolific bearer and free grower, with large stalks. For early forcing it far surpasses every other variety. For making wines, preserves, and all culinary purposes, it is an inestimable production. Strong one-year planted roots 1*s.* 6*d.* each; also Myatt's Linnæus, 1*s.* 6*d.*; and Victoria, 9*d.* The usual allowance to the trade. Post-office orders made payable to WILLIAM MITCHELL, Enfield Highway, Middlesex, will meet with prompt attention. N.B. The above is from four to five weeks earlier than the well-known Victoria.

H. LANE AND SON have great pleasure in recommending the following SEEDS, which may be had by unknown correspondents, by enclosing Postage stamps or Post-office order. Seymour's Celery and Fleming's Melons having been so successfully exhibited, require no comment.

CELERY—Seymour's White Champion ...	1*s.*	6*d.*	per packet.	
,, ,, Superb White ...	0	6	,,	
,, ,, Red Matchless ...	0	6	,,	
,, ,, Golden Perfection ...	1	0	,,	
MELONS—Fleming's, or Trentham Hybrid				
Persian	1	0	,,	
,, ,, Genuine Sweet Ispahan	1	0	,,	

Great Berkhampstead, Herts.

HART AND NICKLIN, FLORISTS, Guildford, Surrey, offer the following Plants, strong and healthy:

GERANIUMS.—1*l.* the dozen: Forget-me-not, Ariel, Magog, Pearl, Gulielma, Aurora, Hebe's Lip, Mount Etna, Conflagration, Arabella, Sultan, and Rosamond. 10*s.* the dozen: Marc Antony, Rosy Circle, Jehu, Mustee, Duke of Cornwall, Orion, Isabella, Lady Rivers, Favourite, Shakespeare, South Western, and Maid of Anjou.

PANSIES.—1*l.* the 20: Juvanta, Sylph, Laneii, Zabdi, Minerva, Premier, Nobilis, Caroline, Gem, Marquis of Lothian, Aurora, Example, Constellation, Berryer, Muta, Ophir, Brutus, Orestes, Queen of Whites, and Exquisite. 12*s.* the 20: Duchess of Rutland, Countess of Stradbroke, Snowdrop, Rainbow, Model of Perfection, Climax, One in the Ring, Dr. Wolff, Madonna, Superb, Supreme, Wonderful, Emperor of China, Joan of Arc, Mary Jane, Bride of Abydos, Satirist, Pizarro, Reliance, and Matilda. Basket included, and, when two Collections are taken, free to any station on the South Western, South Eastern, or Great Western Railways.

RENÉ LANGELIER, St. Helier, Jersey, begs to state that he has still several thousand CAMELLIA STOCKS to dispose of, at from 40*s.* to 50*s.* per 100, all fit for immediate grafting, and well established, so that they can travel without the pots, well packed in boxes. Also several thousands of that fine GLADIOLUS "CARDINALIS," large flowering bulbs, at 5*s.* per 100; it is well known to be perfectly hardy out of doors. Also very large bulbs of AMARYLLIS LONGIFOLIA, also perfectly hardy and blooming; large trusses, very sweet-scented; 2*s.* 6*d.* each.

THE READING GIANT ASPARAGUS.—Strong Plants, 3 years old, 4*s.* per 100; 2 years old, strong, 3*s.* per 100. No charge for package. The above is decidedly the best kind of ASPARAGUS, a large quantity being sent annually at a high price to Covent-garden Market. With small orders a remittance by Post-office order, *or penny postage stamps*, will oblige.

Fine Brown Cos Lettuce plants, 1*s.* 6*d.* per 100.
New Prolific Hautbois Strawberries, 5*s.* per 100.
Address, JOHN SUTTON AND SONS, Reading, Berks.

ROSES.

ROSES established in 24 pots for immediate forcing. (See catalogue for two penny stamps.) Hybrid Perpetuals, the finest of all for this purpose, 1*l.* per dozen.

H. LANE and Son, Great Berkhampstead, Herts.

SEEDS.—A few select Seeds from the original raisers, which have now for several years given such general satisfaction to those who have grown them, viz.:

Elletson's (true) large Mammoth or April White Broccoli.
Elletson's (true) improved Wilcove White Broccoli.
Lindsay's imperial crimson Dwarf Beet.
Usher's "Exquisite" Curled Parsley.
Metcalfe's improved Dwarf Walcheren Broccoli.
Telford's superb early Dwarf Cabbage.

The above may be had at 1*s.* each, or the six sorts for 5*s.*, in Post-office order or postage stamps, on application to WILLIAM MAY, Hope Nurseries, Bedale, Yorkshire. W. M. begs to refer to former *Chronicles* for his Advertisements of select Pansy, Cineraria, Antirrhinum, and Hollyhock Seeds; also to his superb collection of hardy Herbaceous Plants, Hollyhocks, &c.

ON SALE BY THE SUBSCRIBER.—500,000 2-year Seedling Scotch Firs, superior plants, from native Highland seed, at 6*s.* per 1000; 500,000 2-year Seedling Larch; 200,000 3-year Seedling Black Norway Spruce; 200,060 transplanted ditto; a very extensive stock of Fancy Pines, viz., Excelsa, Pallasiana, Banksia, Fraserii, Nobilis, Grandis, Taurica, Webbiana, Pindrow, Lambertiana, &c.; some fine large specimens of Cedrus Deodara and Araucaria imbricata, &c.; a large stock of Irish Yews, from 5 to 10 feet high; with a very extensive stock, all sorts and sizes, of Nursery Stock in general.

JAMES ROY, Jun., Ferry-hill Nurseries, Aberdeen, Feb. 16.

PANSIES, &c.

JOHN SCHOFIELD AND SON are prepared to send out the following set of 24 fine Show PANSIES for 1*l.* 1*s.*, viz.: Duke of Norfolk, Purple Standard, Caroline, Cracker, Blue Fringe, Milton, Paren, Jullien, Indispensable, Canary, Negro, Mrs. Bragg, Disraeli, Duchess of Norfolk, Perfection, Constellation, Zabdi, Candidate, Cypreus, Cossack, Supreme, Androcles, Alpha, Charmer, Post free.

A large stock of older varieties, 6*s.* per dozen.

J. S. and Sons have a few pairs left of their fine seedling PICOTEE, "MISS HOWARD." It was shown at the West Riding Central Floral Society Show, when a committee of seven was appointed to test the merits of the Seedling specimens, and to recommend such only as were worthy of being sold out, viz., Messrs. Smith, Dobbinge, Stephenson, Oxley, Grey, Bramma, and Mansley. It was also submitted to Mr. Wood, in 1848; vide "Midland Florist," No. 21, under the letters J. S.: "12; an excellent light purple edge, good pod, broad and well-formed petals, crowns well; one of the most promising we have seen this season."

A fine healthy stock of the best varieties out, of Carnations, Picotees, and Pinks, 9*s.* to 20*s.* per dozen pairs. Dahlias, Verbenas, and Fuchsias, 3*s.* to 12*s.* per dozen.

Also a full descriptive Catalogue; and a few packets of very select Pansy and Calceolaria Seed, 2*s.* 6*d.* per packet. A remittance is respectfully solicited from unknown correspondents.

Knowsthrope, near Leeds, Yorkshire.

COLE'S SUPERB SOLID RED CELERY.—This fine Celery has given such entire satisfaction, not only for the great size to which it attains, but for its unequalled crispness and exquisite nut-like flavour, that it needs no further recommendation. Seed may be had genuine from the grower, WILLIAM COLE, Dartford, Kent, in sealed packets, 1*s.* 6*d.* each, or the amount in postage stamps; also of Messrs. J. and J. FRAZER, Leyton, Essex; Mr. BUNYARD, Maidstone, Kent; Mr. CRIPPS, Tunbridge Wells, Kent; Mr. DENYER, 82, Gracechurch-street, London; Mr. TILEY, 16, Pulteney-bridge, Bath; Mr. FRANCIS, Hertford; Mr. MILNER, Bradford, Yorkshire; Messrs. J. and J. FAIRBAIRN, Clapham, near London; Messrs. GARAWAY, MAYES, and Co., Bristol; and of Mr. SMITH, Westernam, Kent; Mr. PONTEY, Nurseryman, Plymouth; and Mr. IVERY, Nurseryman, Peckham, Surrey; Mr. ARCHIBALD WOOD, Nurseryman and Seedsman, Worcester; and Mr. POPE, Nurseryman, Gib Heath, near Birmingham; and Mr. CLARKE, 86, High-street, Borough.

* A liberal allowance to the trade.

W. COLE further states, in justice to himself and agents, that his entire stock of seed saved in 1849 is in his possession and that of his agents, from whom it may be had new and genuine, bearing his name and address printed on the envelope.

SPLENDID DOUBLE RANUNCULUS ROOTS.

MR. SNELLING is commissioned to sell a few hundred roots of the above most beautiful flower, the property of an amateur grower. They are of a first class mixture, worth 20*s.* per 100, and may be had for 5*s.* per 100, at 28, New-road, Brighton. Sent carriage free for 6*s.* per 100, or 25 good roots for 18 postage stamps.

Choice Flower Seeds, 18 packets, various, for 18 postage stamps.—ROBERT SNELLING, 28, New-road, Brighton.

JOHN RIVERS, SEEDSMAN, Sawbridgeworth, Herts, begs to offer the following superior productive POTATOES:

2d Early.—Soden's Early Oxford	per bushel	6*s.*	6*d.*
Do. Fox's Seedling	,,	6	6
Do. Shaw's Early	,,	4	6
Late, very superior bearers, and very late keepers	,,	5	0

Carriage paid to London. Post-office orders are requested from unknown correspondents.

VERBENA—"WONDERFUL."

G. MOORE begs to refer the readers of this Paper to his Advertisement of the 2d inst.

Perry Barr, near Birmingham, Feb. 16.

RHODODENDRON PONTICUM FOR UNDER COVER, &c.

JOHN WATERER begs to state he has large quantities of the above, which is now universally acknowledged the best Evergreen for such purposes, being free from attacks of hares and rabbits. Strong plants, fit for immediate planting, 10*s.* 6*d.*, 15*s.*, to 21*s.* per 100.

Descriptive Catalogues of his well known collection of American Plants, &c., to be had on application.

American Nursery, Bagshot, Surrey.

EARLY TEN-WEEK POTATO, the earliest grown, will beat the Ash-leaved Kidneys by ten days—per bushel, 14*s.*; per peck, 4*s.*, bags included. Pure Stocks of ASH-LEAVED KIDNEYS, RED DITTO, BARHAM'S WALNUT-LEAVED, SHAWS, REGENTS, FORTY-FOLD, &c., at moderate prices.

Twelve of the newest and rarest Flower Seeds:

Nemophila maculata	Martynia angularis
Brachycoma, splendid hybrids	Portulaca Thorburnii (yellow)
Phlox Drummondii alba	,, alba striata
,, oculata	Podolepsis chrysanthemoides
,, Leopoldina	Schizanthus retusus alba
Martynia fragrans	Ipomœa Burridgii

One packet each 10*s.* 6*d.*

GERMAN STOCKS, from 2*s.* per collection.
,, ASTERS, from 3*s.* ,,
,, CARNATIONS, 2*s.* 6*d.* per 100.

DUNCAN HAIRS, 109, St. Martin's-lane, Charing-cross, London.

SUPERB RANUNCULI.—The present being the usual month for planting, we beg to recommend the following. The new varieties have been selected with great care, of first rate sorts, from immense quantities of seedlings; and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.

RANUNCULUS.—Free by post.	£	*s.*	*d.*
50 Splendid new varieties, with names	2	0	0
25 do. do. do.	1	2	0
50 Fine older varieties, do.	0	15	0
25 do. do.	0	8	0
100 Finest mixed	0	10	0
100 Fine mixed, 5*s.*; or free by post for	0	6	0

A Descriptive Catalogue of the seedling varieties may be had. Remittances are expected from unknown correspondents.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

CEDRUS DEODARA OR HIMALAYA CEDAR.—The Subscribers beg to inform the admirers and planters of the above hardy Tree, that they have upwards of FIFTY THOUSAND, from one to five years old, in pots, grown from seed, constantly in the open ground, which they are now supplying on such terms as will induce their general introduction into all plantations, being of rapid growth, highly ornamental, and of great value as a Timber tree.

WM. MAULE and SONS, Stapleton-road Nurseries, Bristol.

WHITETHORN AND BEECH FOR FENCING—500,000 very fine four years old transplanted WHITETHORN, at 6*s.* per 1000, or, selected, at 7*s.* 6*d.* per 1000; and fine Bedded BEECH, 2 to 3 feet, at 8*s.* per 1000. A large quantity of very fine transplanted OAKS, ranging from 3 to 5 feet, at 35*s.* per 1000. The above are all extremely fine and well rooted. Samples if required.

ARTHUR MACKIE, Nurseries, Norwich.

MYATT'S LINNÆUS RHUBARB.

J. MYATT AND SONS can confidently recommend this variety as the best in cultivation. The most satisfactory proof of this assertion is the fact that the Market Gardeners round London and Manchester have planted the Linnæus Rhubarb more extensively than any other variety. It is extraordinarily productive, and about a fortnight earlier than the Victoria; added to this, it is held in general esteem for preserving and all culinary purposes. One-year planted roots, 1*s.* 6*d.*; ditto, Mitchell's Royal Albert, 1*s.* 6*d.*; Victoria, 9*d.* The usual Trade allowance.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford.—Feb. 16.

BOTANICAL EXPEDITION TO OREGON.—COMMITTEE.

The Hon. Lord Murray
The Hon. Lord Cunningham
Sir David Dundas of Dunira, Baronet
Sir John M'Pherson Grant of Ballindalloch, Baronet
Wm. Gibson Craig, Esq., M.P.
William Murray, Esq., of Henderland
G. Patton, Esq., of Cairnies
J. H. Balfour, M.D., Professor of Botany
Charles Lawson, Esq., George the Fourth Bridge
James Greig, Esq., Inverleith Nursery
I. Anderson, Esq., Maryfield
James Macnab, Esq., Royal Botanical Gardens.

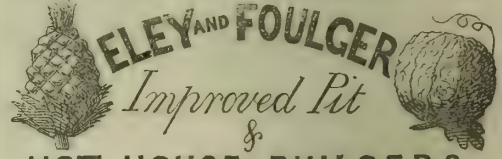
Andrew Murray, Esq., of Conland
Charles M'Intosh, Daikeith } *Joint Secretaries.*
David Smith Esq., W. S., *Treasurer*

With power to add to their number.

It having been thought by several Gentlemen interested in the ARBORICULTURE and HORTICULTURE of SCOTLAND, that it would be of great benefit to the country, as well as to the interest of these SCIENCES, to introduce the SEEDS of such of the HARDY TREES, SHRUBS, and FLOWERS OF NORTH AMERICA, as are suited to the climate of this country, an ASSOCIATION has been formed for this object, and the services of a young Botanist of zeal and great skill, can be obtained, who is ready to follow up the labours of the late Mr. Douglas, to complete his researches, and to extend them into that part of the country not fully explored by him. It has been ascertained that a great many TREES, PLANTS, and SHRUBS, hitherto unknown in Great Britain, and likely to prove valuable additions to the Forests and Gardens of Scotland, exist in these districts. With the view of raising the funds necessary for carrying this object into effect, it has been resolved that each person willing to support the undertaking, shall subscribe the sum of Five Pounds, or so many shares of the same amount as they may please, each Subscriber being entitled, for every share, to a corresponding portion of the SEEDS which may be collected from time to time, sent home. No Subscriber to be liable for anything beyond the amount subscribed by him. The Committee undertake that the distribution of the SEEDS shall be conducted on principles of the greatest fairness and impartiality. The names of Subscribers will be received by any of the Members of the Committee, or the Secretaries or Treasurer; and as the Botanist will leave this country as soon as a sufficient sum shall be obtained, and the subscription will then be closed, the Committee request that their friends who intend to subscribe will guard against disappointment by coming forward without delay.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.



J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

TO NURSERYMEN AND SEEDSMEN.

TO BE DISPOSED OF, in consequence of the recent decease of Mr. JOHN RONALDS, of Brentford, the old-established and extensive BUSINESS OF MESSRS. HUGH RONALDS AND SONS, of that place.—For particulars, apply on the premises; or to Mr. E. RONALDS, 109, Upper Thames-street; or to Mr. G. B. TOWNSEND, Accountant, 49, Leadenhall-street, London.

HOT-WATER APPARATUS MANUFACTURERS, &c., being practical working men, are enabled to execute work on the best and most economical principles, and also beg to inform the nobility and gentry that they are enabled to supply their DOUBLE SADDLE CAST IRON BOILERS, portable, complete, with sliding furnace doors, bars, ash-pit, and cast iron smoke conductor, the whole requiring no brickwork, or can be had otherwise, being more durable than copper or wrought iron, surpassing all others. 4-inch best Hot-water Pipes 1*s.* 2*d.*, 3-inch 10*d.*, and 2-inch 8*d.* per foot. Tank work 1*s.* 3*d.* per foot; superior valves, and all other connections, equally low. Buildings, or Hot-water Apparatus, supplied and arranged so that any gentleman's tradesman can fit them up, or they can have E. & F.'s services at trifling expense. Can be most highly recommended by several noblemen and gentlemen, for whom the most complete works have been erected. Greenhouse Lights and Frames, Boxes, &c., of every description. Old Buildings and Apparatus taken down and remodelled.

N.B. Work done for the trade. Any description of Boilers supplied. Estimates free.

Address—City-road, near the Toll-gate, London.

RENDLE'S DESCRIPTIVE CATALOGUE OF SEEDS can still be obtained GRATIS, on receipt of two penny stamps, to pay the postage.

OPINIONS OF THE PRESS.

Dr. LINDLEY, in the *Gardeners' Chronicle*, Dec. 22, 1849, says,

"*This contains lists of good vegetables, with useful notes appended to the names of many of the sorts. . . . It is a well-arranged Catalogue, and will be found of service to all purchasers of Seeds.*"

The Editor of "The Midland Florist," for January, 1850, says,

"*We have just received the General Catalogue of Garden, Agricultural, and Flower Seeds, sold by William E. Rendle and Co., Plymouth, which, from its excellence, well merits something more than a passing notice, and happy shall we be from time to time (with Messrs. Rendle's permission) to extract some of its valuable information for the benefit of our readers. . . . The Flower Seed List is peculiarly comprehensive, and gives to each variety its scientific name, hardihood, time of duration, colour, height, and time of flowering. Our readers will thus see that, from its immense utility, we can scarcely say too much in its recommendation; and we are sure that the name of the eminent firm will be a sufficient guarantee that every article they send out will not only be true to name, but also of the best possible quality.*"

Apply to WILLIAM E. RENDLE and Co.,
Seed Merchants, Plymouth.

UNIVERSAL CATALOGUE OF VERBENAS, FUCHSIAS, DAHLIAS, CHRYSANTHEMUMS, PETUNIAS, &c.

G. SMITH'S Priced and Descriptive Catalogue contains the very best selections of the above; with a useful note and a marked List of the best Verbenas for exhibition in pots, with mode of training, and what is of great importance to exhibitors, the time of stopping back, so as to catch a sheet of bloom when it may be required; with descriptions of his superb Seedling Fuchsias, Verbenas, Petunias, &c.; and will be forwarded on the receipt of one postage stamp.—Tollington Nursery, Hornsey, Islington.

EPPS' COLLECTIONS OF KITCHEN GARDEN SEEDS.

No. 1 contains the following quantities, and are of the best and newest kinds, being a sufficient supply for a nobleman's large establishment: 26 quarts Peas, 12 quarts Beans, 4 oz. Beet, 1 oz. Borecole, 6 oz. Broccoli, 1 oz. Brussels Sprouts, ½ oz. Buda Kale, 7 oz. Cabbage, 10 oz. Carrot, 2 oz. Cauliflower, 2 oz. Celery, 3 lbs. Cress, 4 pkts. Cucumber, 2 oz. Endive, 2 oz. Leek, 6 oz. Lettuce, 3 pkts. Melon, 2 quarts Mustard, 10 oz. Onion, 4 oz. Parsley, 6 oz. Parsnip, 2 oz. Savoy, 3 pints Radish, 1 oz. Scorzonera, 2 quarts Spinach, 2 lbs. Turnips, 1 pkt. Vegetable Marrow, 1 oz. Salsafy, and 12 pkts. Herbs, Chili, Capsicum, &c. £3 3 0
No. 2, two-thirds of the above 2 2 0
No. 3, one-third ditto 1 1 0
No. 4.—This collection is sufficient for a gentleman having a moderate sized garden 0 12 6

The great satisfaction these collections have given to some of the principal families in England, Ireland, Scotland, and Wales induces W. J. EPPS with confidence to solicit further patronage. The collections contain this year 15 per cent. more than last, and quite equal in quality. Descriptive Seed Catalogues may be had on application. All orders to be accompanied with a Post-office order from unknown purchasers. No charge made for packing, and delivered free of expense to any railway station in London.—Agricultural and Horticultural Seed Establishment, High-street, Maidstone.

*** Cole's Superb Dwarf Red Celery, 1*s.* per packet.

PLANTING SEASON.

ALFRED BALSTON begs to inform planters he has still a large proportion of his Nursery Stock to dispose of, which, in consequence of having relinquished the trade, he offers at very reduced prices. The Stock comprises every variety of ORNAMENTAL, FRUIT, and FOREST TREES, and all the best kind of SHRUBS in cultivation, no expence having been spared in the collection, and from the light nature of the soil in which it has grown, the plants have all a mass of fibrous root, which causes them to grow most luxuriantly after being transplanted.

A.B. particularly recommends the following: Common Laurel, 9 inches to 1 foot, 15*s.*; 1 to 2 feet, 30*s.*; 2 to 4 feet, 40*s.*; 4 to 6 feet, 80*s.* per 1000. Portugal Laurels, 1 to 2 feet, 10*s.* per 100. Rhododendron ponticum, 1 to 2 feet, 30*s.*; 3 to 4 feet, 60*s.*; 4 to 5 feet, 100*s.* per 100. Ghent Azaleas of all the finest kinds, specimen plants, 2*s.* 6*d.* each; smaller ditto, 6*s.* per dozen. Rhododendron campanulatum, caucasicum, catawbiense, &c., 100*s.* per 100. Standard Roses of all the finest sorts, 12*s.* per dozen. A large stock of Evergreen Oak in pots and transplanted; also common Oak, Elm, Beech, Birch, Berberis, Hornbeam, Privet, &c.

Orders must be accompanied by remittances. Orders amounting to 5*l.* delivered free.—Poole Nursery, Dorset.

GENUINE HOME-GROWN SEEDS FOR THE KITCHEN GARDEN, may be had of the Subscriber, in collections of 12*s.* 6*d.*, 1*l.*, 2*l.*, and 3*l.* worth, containing the most approved varieties in cultivation. Also for the Flower Garden, in selections of 25 kinds for 6*s.*, 50 for 10*s.*, 100 for 18*s.* packed in Ayres and Moore's new labels, with directions for culture, time of flowering, whence introduced, &c.—WILLIAM MASTERS, F.H.S., Exotic Nursery, Canterbury.

W. M.'s New Catalogue may be procured on pre-paid application. Orders amounting to 2*l.* and upwards delivered to any station on the South-Eastern Railway.

The Gardeners' Chronicle.

WE cannot say that our correspondents have thrown much light upon the question whether SAP DESCENDS. The letters we have hitherto received refer to nothing more than this, that organisable matter is universally diffused in the system of a tree. But that is not the real point of enquiry; what should be explained is, why, when a *ring* of bark is removed from a branch the new growth takes place principally on the upper edge of the wound and very slightly on the lower; and why gum, formed in the leaves of a Potato is afterwards found in the tubers, in the final form of starch. It would be as well to confine attention in the first instance to these two cases; and to show—1. That they do *not* depend upon the presence of what is called descending sap; and 2, to what else they are owing.

The general diffusion of sap, which is universally admitted, even allowing to that term the meaning of organisable matter, does not appear to us to have any bearing on the question of a ringed branch; although it may explain such an instance as the following, for which we are indebted to Mr. TOWERS.

"Certain it is that the bark of trees, when wounded, or cut in amputation of branches proceeding from the trunk, converges from all points, and not solely, as some assert, from the uppermost, cross incision. The Elm tree may furnish the best examples for investigation, some of which are to be seen in every hedge-row. In the public road leading from Waddon to Mitcham Common, there stand several large Elms in front of a gentleman's house. A wound was made in one of them fully 18 inches long, and in the middle 5 or 6 wide, by which the bark stripped off to that extent, exposed the wood below it. The young

liber came rolling forward on every side, and is now seen approaching pretty equally, though with projections of a redder colour, which mark the more recent processes. A line of posts and rails, with a chain at top, extends along the front, close to the row of trees. An abrasion or wound had been made in close contact with a part of the chain, which now is buried, and firmly fixed in the bark, by a knotty boss formed of cortical matter."

In this instance the descending sap, uninterrupted in its course downwards, may be said, by its lateral diffusion, to have formed wood at every part of the edge of the wound; which would readily happen, the continuity of the bark being interrupted only for a narrow space, and not all round. But if this case does not bear on the question at issue, it singularly illustrates a curious story told in a late number of "CHAMBERS' Journal." "A traveller mentions an instance of the 'sentient principle' occurring among the denizens of an Indian forest. Two trees, he tells us, of different kinds, although only 3 feet apart, had grown to the height of 50 or 60 feet, when one of them took the liberty of throwing out a low branch in such a way as to touch the trunk of his neighbour, and thus occasion much pain and irritation. 'On this the afflicted tree in turn threw out a huge excrescence, which not only enveloped the offending branch, but strangled it so completely as to destroy it utterly; the ends of the deadened boughs projecting 3 or 4 feet beyond the excrescence, while the latter was carried on a distance of 3 feet across to the shaft of the tree, so as to render all chances of its future movement wholly impossible!' This appears to our traveller to display as much forethought and sagacity as taking up an artery for aneurism, or tying splints round a broken bone." Here it is evident that the excrescence of the "afflicted tree" is the boss described by Mr. TOWERS.

Another cause of the junction of the lips of a ringed wound, independently of the descending sap, is the rapid growth of the medullary rays all over the surface of the naked wood. We need not say that when wood is laid bare by the removal of bark, the ends of an infinite number of medullary rays are exposed; these ends have a great power of growth, which they sometimes exercise in such a way as to clothe the surface of the wood with bark, wholly independently of any material advance of the lips of such a wound. Of this we have the following instance, from the Rev. M. J. BERKELEY: "A vigorous Oak had been mischievously barked all round, and to such an extent as to preclude all probability of ultimate union of the severed edges. The tree, however, for a year or two seemed to suffer very little from the injury, as new tissue was thrown out from the exposed extremities of the medullary rays; and to such an extent, that had not the parties who first injured the tree been so bent on its destruction as to cut away the newly-formed tissue, union would have speedily been effected, and the tree in all probability preserved. The growth of new tissue was not assisted by any thin strips of the inner bark still adhering to the tree, by which the descending tissue could have been conducted, but proceeded simply as indicated above, from the medullary rays."

Or there may be exceptional cases, in which the organisable matter (descending sap) collected in the interior of a tree, unable to follow its accustomed track, may be expended in the formation of wood, even in an ascending direction; as in another instance mentioned by Mr. BERKELEY, of a young Ash tree, sawn off level with the ground, the disc of which, though no new shoots have been thrown up, is gradually closing over like the Firs (Abies pectinata and Pinus Picea) described by M. GŒPPERT in the volume of the Ann. des Sc. Nat. for 1843. In the present instance, as no other Ash tree grows near it, there can be no room for supposing that its roots are ingrafted into those of some neighbouring tree, as was found to be the case with GŒPPERT's Firs.

To deny the existence of a descending sap is virtually to deny the truth of the whole theory of wood formation. We do not here speak of AUBERT DU PETIT THOUARS's views, or of those of Mr. GAUDICHAUD, as they are explained by those physiologists; but we allude more especially to the views of DUHAMEL, DE CANDOLLE, MIRBEL, and others, who, after all, differ from the two first physiologists more in the terms they employ than in the facts on which they rely. Few botanists indeed are, we believe, prepared to deny altogether the views of M. GAUDICHAUD respecting the descending course of the development of the wood-cells, though their notions may be modified by MIRBEL's assertion of their growth from the cambium. Nor will their judgment be shaken by the acrimony with which the controversy between those celebrated physiologists was carried on; for it is probable that in this, as in so many other disputed questions, there is a degree of truth on both sides.

Our invitation for the communication of facts and opinions on this interesting subject ought to elicit many curious examples; but deductions are not to be drawn too hastily from a few exceptional cases, though they may suggest matter for consideration, and prevent our narrowing our views too much to one line of argument.

"A GARDENER," said the late Mr. KNIGHT, "having "to expend the capital of others, ought to be cautious "in trying *expensive* experiments, of which the results "must be necessarily uncertain; and I believe a very "able and experienced gardener, after being the in-"ventor of the most perfect machinery, might, in "many instances, have lost both his character and "his place before he had made himself sufficiently "acquainted with it, and consequently become able "to regulate its powers."

It is doubtful whether a sentence more full of practical wisdom than this has ever been penned for the instruction of gardeners. It points out to them forcibly the wrongness of addicting themselves to mere experiments at the cost of their employers, and the danger which they incur as regards their personal interests. The warning, too, came with peculiar force from one who was himself the greatest horticultural experimentalist that ever lived. It was a plain declaration that few of the numberless trials which he had himself made of new methods had answered the purpose sufficiently to have justified a gardener in having taken their risk upon himself.

No doubt can exist that the greatest experience, and the most complete acquaintance with principles, even when combined with the most perfect tact in applying them, continually fail to suggest experiments, the result of which is certainly successful. There exist in nature so many counteracting circumstances, of unsuspected, or unascertained, or unexpected force, that the best-laid plans break down when brought into play against them. These natural forces may be not unaptly compared to the moral forces which oppose the application of abstract theories to human affairs; or rather which oppose the regulation of human affairs by the best considered theories. They constitute a kind of friction, the amount of which can rarely be calculated beforehand. The result of this is seen in the frequent failure of chemical speculations when practically applied to cultivation; as, for example, in the artificial manures prepared by Professor LIEBIG, and so many others. No doubt can exist that this eminent

philosopher is as intimately acquainted with his peculiar science as any living man, and that if *à priori* reasoning could be trusted, his would be worthy of all confidence. If then such as he break down, what may a gardener not expect?

These important truths are, however, greatly misinterpreted. Many persons imagine that, because they are enjoined not to try *expensive* experiments at the cost of their employers, therefore they are not authorised in trying any experiments whatever. Others take up the singular crotchet, that, because they are not to lay out their employers' capital in volunteering expensive experimental researches, therefore they are to oppose all such researches when their employers assume all the responsibility of success or failure. And hence we find men doggedly setting themselves against everything except routine, and resolutely thwarting all plans which bear the stamp of novelty.

How senseless is this! Fraught with what danger to the progress of improvement! Experiment is the soul of cultivation, and those who at their own charge are willing to undertake its risk, should surely meet with whatever aid and assistance experience can suggest, instead of being thwarted by those who are bound to execute *faithfully* the orders they receive, and without a question. Suppose, for example, A has a gardener, called *b*; A orders an Apple-tree to be taken up, and replanted with its roots in the air, and its branches in the ground—is *b* justified in objecting to execute the order? Certainly not; nor can he claim a right to know what end A has in view in so novel an operation. What he is bound to do is to take care, as far as he is able, that the branches strike root in the ground, a condition essential to the experiment. If the tree dies, it is the affair of A; not of *b*, as some gardeners imagine, who fall into the mistake of supposing not only that their employers' property is their own for all purposes except that of sale, but that they are answerable for the consequences of their employers' acts. This mistake no doubt arises, in some cases, from the gardener having an honest pride in the articles confided to his care, and from the belief that strangers will impute to him the blame of failures or preposterous schemes which belong to his employer. But it is not the less a mistake. It is one, too, which cannot be too quickly extirpated, because it has cost many a well-meaning, but ill-advised gardener, his place, and deprived many an employer of half the pleasure which his garden would have afforded.

We would therefore recommend gardeners to encourage their employers to engage in rational experiments in gardening, and, laying aside all blue-apron fancies, to join cordially in bringing them to a *true* issue. By this means they will add much to the interest which the wealthy classes take in one of their favourite enjoyments, and will powerfully contribute to the real advancement of their own art. All the world is now alive to the necessity of progress: men of property are anxious to ascertain the true value of the numerous propositions continually submitted to them. A garden is often the place in which preliminary enquiries can be best conducted, the gardener is the person to be charged with them, and he may depend upon it that the more zeal and intelligence he displays in executing such a duty, the greater will be his value to his employer, and the higher his elevation in the social scale.

ROSES.

A few Words on Forcing the Rose.

Roses are generally forced in pots in which they have been established one year at the least, but oftener two. When they are put into the first house, which is little better than a greenhouse, in the month of October, or later, according to the time they are wanted in bloom, the intention is to gradually increase the temperature until the plants are prepared for the warmer atmosphere of the forcing-house. When the Roses have been bloomed and are done with, they are generally turned out of doors to complete their growth, and they are either planted out or otherwise disposed of, certainly not forced the following year according to general practice. This is altogether a wrong principle, because the Rose, like the Vine, may be brought to begin its growth at almost any season. The first year it is very difficult to force well. The best way is to put the plants in the house the first year they are potted, and as soon as they are potted, in September or October. Let them be watered, and the house kept at 45° at the most for all the first month. We are to presume that the plants are pruned down to the usual two eyes, and all the small wood cut out. At the end of the first month, which has no apparent effect on the plant, the temperature may be raised gradually to 55°. They must be examined the instant the buds burst, and if there be any appearance of fly, the house must be fumigated, and the plants well syringed. As the shoots grow the temperature may be raised to 60°, and be placed near the glass, that they may not be drawn. If you can raise the temperature sufficiently to enable you to give plenty of air, let it be done. Our business is not so much with the forcing of flowers the first season as it is to establish the plants in their pots; and, by forwarding them three months the first year, have them to be ready three months earlier to begin their work next year. There will be straggling flowers among them the first year, but they are better picked off while buds than be allowed to flower and check the growth of the plant. Let it complete its growth as carefully as if there were the flowers. As soon as the weather will make it safe, let the plants be plunged in the shade up to the rims of the pots, and remain there until the leaves fall and the wood ripens. They may then be pruned to two eyes for each strong shoot, and cut out all the weak ones. Let them be placed in the cool house as before, which house must not be a higher temperature than 45°. It will be seen that from the Rose bushes having had their rest three months longer than those out of doors, they will be as forward without heat as they were the first year with heat, and you may calculate on being able to force them better year after year, and they will not draw so much. They will require the heat increased, but not so early, and they will begin as regularly to open their buds at the earlier period as they used to open at their proper season.

Rose forcers may, in fact, take an excellent lesson from Vine forcers, yet we have seen the best Grape forcers in the kingdom buy, year after year, new two-year established Roses, or one year, to force the same year; and more than once we have seen them fail, with all their care and gently nursing them from 45° to 65° by slow degrees; and when done with, set out to rest themselves, as it was called, but in fact to get back to their old backward habit, instead of remaining ready to begin to work earlier. The only objection that we have ever heard was that the plants were spoiled by forcing, that is, were drawn up too much to be recovered in one year. This is not complimentary to the forcers, but the principal object gained by forcing the same plants continually was this, they became changed in their season, and at length scarcely wanted forcing, a lower temperature being sufficient to bring them to perfection, and they therefore became less inclined to draw every year they were produced. Of course, the pots required shifting occasionally, the pruning was necessary, and, in other respects, they required as much care as their out-of-door neighbours; but the same set of Roses has been forced several years, and if they were not quite so strong as Roses are at their proper season, they were much stronger than the ordinary run of forced Roses at the nurseries. When the flowers are bursting and coming nearly to perfection, it is desirable to lower the temperature gradually to 55°, at which they will last much longer, and become better able to stand the possible changes sustained in removal. The Moss Rose is the principal forcing variety, but Rose du Roi is the best of the others for bringing out of season. These remarks apply as much to standard Roses as to dwarfs on their own roots, but the China, and continuous blooming kinds on their own roots, may be kept in flower all the winter, or rather a succession can be kept up from one end of the year to another. A common hotbed will do as well as houses; and it is only necessary to have beds of different temperature, or rather to have a new bed ready when the old one gets exhausted. The forcing after the manner we have here described applies only to summer Roses on their own roots, and all kinds of varieties on common Briars; for, if the Briar is excited, there is no difficulty about the heads. *Crito.*

ELVASTON CASTLE, THE SEAT OF THE EARL OF HARRINGTON.

(*Concluded from p.* 84.)

Although, as we have stated, the gardens at Elvaston have been, comparatively speaking, but lately called into existence, yet the multitude as well as the magnificence of the specimens of trees and shrubs they contain surpasses common belief. We shall proceed to bear out this assertion by a statement of a few of the remarkable plants which struck us as being well worth recording, and shall begin with

	Height—ft.	in.	Remarks.
Araucaria imbricata	26	0	
Ditto	17	4	There are about 150 of these sizes down to 10 feet; below this there are upwards of 1000 fine plants.
Ditto	16	3	
Ditto	14	9	
Ditto	14	6	
Ditto	14	3	
Abies Douglasii	28	6	
Ditto	21	9	About 200 of these large sizes, and of all sizes about 1000 fine specimens. Three are very distinct varieties, one having red cones.
Ditto	21	6	
Ditto	23	0	
,, canadensis	many hundreds from 8 to 18 feet.		
,, cephalonica	13	6	—Above 100 specimens, from 3 feet to this size.
,, Pinsapo	5	6	—From this size down to 3 feet, above 30.
,, Menziesii	12	6	Great numbers of these, and two distinct varieties.
Ditto	11	3	
,, Brunoniana	3	0	—Across the branches 3 feet; about 30 plants of this size.
Picea grandis	11	9	—Diam. of branches 11 ft. 4 in.
Ditto	9	3	—,, ,, 10 ft. 8 in. Very beautiful.
,, nobilis	9	6	
Ditto	7	7	Of these and lesser sizes there are considerably above 100 plants.
Ditto	8	5	
Ditto	6	8	
Ditto	6	6	
,, Webbiana	15	2	Many of these, and of smaller sizes.
Ditto	10	5	
,, Hudsoniana	many 2 feet across.		
,, Nordmanniana	4	3	The latter is 3 ft. 8 in. across; first plant brought to this country.
Ditto	3	1	
Pinus insignis	22	9	
Ditto	21	1	
Ditto	18	1	
Ditto	17	1	There are many hundreds of these large specimens.
Ditto	16	0	
Ditto	14	0	
Ditto	21	9	
,, macrocarpa	30	4	
Ditto	29	0	Several others down to 10 ft., as well as numbers of smaller specimens.
Ditto	18	3	
Ditto	19	3	
Ditto	20	8	
,, Sabiniana	17	6	
Ditto	14	0	Many others 10 feet and about these sizes; the third mentioned specimen is 17 feet across.
Ditto	16	1	
Ditto	16	0	
Ditto	14	6	
,, Coulteri	11	3	This is very distinct from the foregoing.
Ditto	12	8	
,, Lambertiana	18	10	
Ditto	17	9	Above 30 other specimens.
Ditto	14	0	
,, ponderosa	25	0	
Ditto	24	6	Common variety.
Ditto	21	6	—Very distinct from the former, being remarkably dense and fine, both sorts have seeded, from which many have been raised.
,, Cembra helvetica	18	0	—About this size there are several hundreds.
,, excelsa	15	11	—Do., several varieties exist among these.
,, monticola	5	2	—Several of these.
,, australis	12	0	
,, nivea	7	0	—The first plant introduced to this country.
,, Laricio	30	0	—Above 1000 large plants.
,, austriaca	15	0	—Ditto ditto.
,, Romana	25	0	—Very beautiful.
,, Spanish var. of pyrenaica	19	1	—16 feet 8 in. across; very handsome.
,, pyrenaica	15	0	—13 feet 6 in. across; many of them.
,, apulcensis	15	4	—Several very beautiful.
,, ayacahuite	9	6	—Ditto ditto.
,, Devoniana	5	0	—6 ft. 9 in. across.
,, Lindleyana	10	3	—15 ft. 6 in. across; several.
,, Russelliana	8	0	—9 ft. 3 in. across; very robust; several plants.
,, patula	9	9	—11 feet across; very graceful.
ditto	10	9	—12 feet across; very graceful.
,, macrophylla	6	3	—6 feet across; several.
,, Teocote	4	9	—A number about this size.
,, Llaveana	3	2	—Many.
,, Orizabæ	2	0	
,, pithyusa	7	6	—6 ft. 9 in. across; very dense.
,, occidentalis	7	3	—7 ft. 7 in. across.
,, Pinaster variegata	20	6	—Very handsome.
ditto	13	0	—A large number of these.
ditto	11	0	
Taxus baccata fastigiata	13	1	—Above 1200 large specimens.
Do., gold-striped	9	6	—12 feet across.
Ditto	10	0	—18 feet across.
Ditto	13	9	—Of this above 1000 specimens.
,, canadensis	4	0	—Many.
,, nucifera	4	1	—In fruit; several.
,, Harringtoni	3	0	—4 feet across; many.
,, coriacea	3	6	—Ditto.
,, tardiva	2	6	—Many.
,, elegantissima	2	0	—Ditto.
Juniperus chinensis	18	2	
Ditto	14	0	Above 1000 grand specimens of these.
Ditto	13	9	
Ditto	15	9	
,, recurva	11	9	Above 100 specimens.
Ditto	12	0	
,, cracovia	8	6	Several.
,, daurica	9	0	
,, lycia	8	6	—Many.
,, suecica	11	0	
Ditto	10	9	Many of such sizes, and hundreds nearly as large.
Ditto	9	6	
,, hibernica	11	3	—Above 1000 grand specimens.
,, excelsa	13	0	
Ditto	10	6	About 200 specimens.
Ditto	10	6	
,, thurifera	13	0	Many.
,, canadensis	13	3	
,, squamata	—	—	—5 feet across.
Cupressus sempervirens	17	7	—A large number about this size.
,, torulosa	14	0	
Ditto	13	6	Above 100 fine specimens.
Ditto	12	6	[beautiful.
,, thyoides variegata	12	6	—Above 100 fine ditto, very
,, thurifera	13	0	—Many fine plants.
,, macrocarpa	9	0	—About 100 specimens.
Cryptomeria japonica	9	0	—7 feet across (*in fruit*); of this many fine specimens.
Thuja orientalis	14	0	—Many hundreds.
,, filiformis	6	2	—Several beautiful plants.
,, Wareana	9	6	—Above 100 large plants.
,, plicata	4	0	—A considerable number.
,, tatarica	10	0	—Many.
Taxodium sempervirens	10	6	—Circumference of stem 14 ins.; many of this.
Cedrus Deodara	22	0	
Ditto	25	4	Many hundreds of these sizes, and some thousands of what would be considered fine specimens.
Ditto	24	6	
Ditto	25	8	
Ditto	25	0	

The above only conveys a very imperfect idea of the contents of the ornamental gardens at Elvaston. The reader must rather deduce his own inferences from the imperfect sketch we have given, than from any list which a cursory visit of a few hours could produce. We have only referred here to a few Conifers and Taxads, but it may be stated that no evergreen tree or shrub known to bear our climate, has been omitted a place in this collection, however difficult or expensive they may have been to procure. Variety, therefore, an important element in all garden scenery, has been attained in no ordinary degree here; and this is maintained throughout the whole, as far as may be consistent with the principles so manifestly exemplified in every part, together with the character emanating from those principles, which demanded, under particular circumstances, that the arrangement should be perfect as a whole, in relation to its individual parts; hence it became necessary to employ, in certain divisions, a greater number of particular species or varieties to express clearly the idea upon which the arrangement was based. Certain styles of gardening admit of con-

tinuous variety throughout all parts; others, again, as at Elvaston, depend for their variety on a combination of materials of a particular character, brought together with a view to the completion of a certain object, in order that that object may contrast advantageously with other objects differently expressed, and with other varied materials. It must, therefore, be evident that individual parts distinctly required in the detail a certain amount of uniformity to contrast and balance other parts, without which conformity of idea as well as design became confusion. In order therefore to rightly interpret the great beauties of Elvaston, the vastness of the whole must be grasped by the mind which attempts the task.

We beg to observe, in conclusion, that these gardens, great and unrivalled as they are, are by no means finished. The same great spirit of improvement is still in active operation, neither blunted nor dismayed by the majestic grandeur of the designs already completed, which strike us with wonder and astonishment. The noble proprietor of Elvaston, derives an amount of pleasure of the most rational and most enjoyable kind in the accomplishment of his great garden schemes, which no other pursuit could have afforded him, contributing health with the most refined amusement. From his castle, in the words of the poet,

"A wood coeval with himself he sees,
And loves his own contemporary trees."

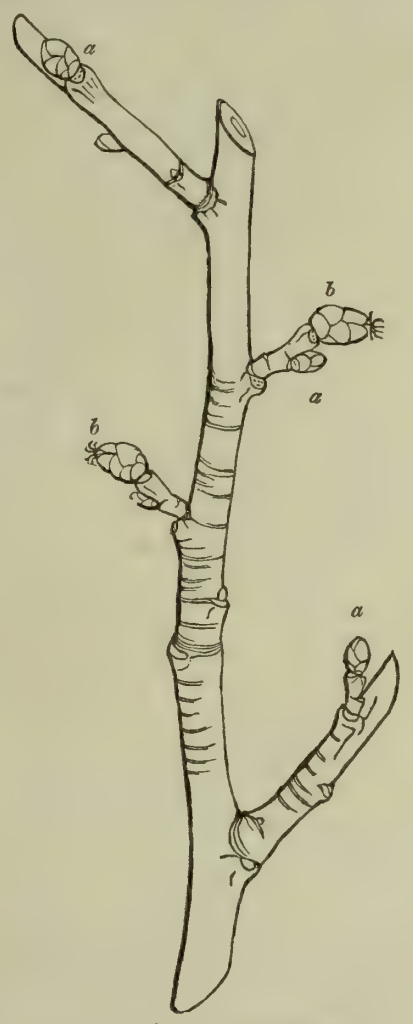
R. Glendinning.

DISEASES OF PLANTS.

(*Continued from page* 86.)

Genus XIV. Polysarcia, *or extraordinary Augmentation of Bulk.*—This disease might be easily confounded with others, if attention be not paid to its peculiar symptom, the extraordinary increase of volume, accompanied sometimes by bursting; or if that does not take place, degenerating into other diseases, such as ulcers, for instance. These results do not occur in the allied disorders, where excess of vigour in vegetation prevents the production of flowers or fruits. *Polysarcia* generally arises from sthenical causes. Abundant nourishment and excess of sap, depending on over energy in the natural stimulants, may produce it; so also too much water or cold, which does not allow that respiration which is necessary in vegetable economy, may occasion the same phenomenon. I, therefore, distinguish three species.

First Species. Apparent Polysarcia.—In this case the enlargement is followed by an irregular splitting, not longitudinal, as in the case of Rent or Screpolo. It is the easiest of cure. When the aperture appears to have attained its full size, it must be treated as I have directed in the case of ordinary wounds.



Second Species. Concealed Polysarcia.—Sometimes, although rarely, arborescent plants will exhibit enlargements, but the epidermis has sufficient strength to resist the force of the sap without bursting. The disease may thus be said to be concealed. Where the indications of its existence are certain, the bark, whether of the branch or of the root, may be pierced, so as to allow the issue of the superabundant matter. Sometimes also cautery may be advantageously applied.

Third species. Polysarcia of Fruit.—Plenck classes the bursting caused by *polysarcia* amongst external injuries. To me, however, it appears to be merely the last stage of the disease. I have, therefore, established this species of *polysarcia of fruit*, which in rainy seasons is very common in the Grape and some other fruits. There is no remedy for it. The fruit, from the abundance of rain, becomes over filled with juices, which it cannot assimilate for want of the requisite stimulus. The skin gives way to the pressure of these juices and bursts.

Genus XV.; *one species.* Anasarca, *or Softening and Watery Swelling of all parts of a Plant.*—Many plants, especially herbaceous ones, when grown in a rich and well-watered situation, become not only more bulky than usual, but acquire a soft and tumid consistence, with an insipid and watery flavour. This disease is almost always the result of a moderately warm season, with frequent rains. It is the cause of the inferior quality of wines, which in some years have no strength, for want of the development of saccharine matters. Kitchen garden vegetables, especially roots and bulbs, are very subject to it. It is very nearly allied to *polysarcia*, the only difference being the excessive softness the plant acquires without any bursting. As the disease is owing to over-irrigation, it can be prevented in gardens, but its cure is impossible. In years where rains are unusually plentiful, it may be observed also in the grains of corn. When scarcely formed, instead of drying up, they become soft, and if in the least degree stimulated by heat, they will develop their germs, and young plants will form in the ear itself, as I have myself observed in my youth. The same thing will happen in plants subject to *bulbomania*, independently of those which naturally produce bulbs mixed with their seeds. In this case the disease assumes a very different aspect, but its origin is the same—a superabundance of juices, which, for want of the proper stimulus, is unable to flow in the ordinary channels.

PRUNING.—THE FILBERT TREE.

The Filbert Tree is one of those which does not contain all the parts necessary for the production of fruit in the same bud. Some buds develope only the male parts, and others only the female; the former are comprised in those pendant yellow catkins, easily recognised in the end of winter and early spring. The female portions are less conspicuous; all that appears of them are some slender, deep crimson stigmas, protruding beyond the apex of the buds, as represented at *b b*. On these, fertilising particles from the catkins either fall naturally, or are otherwise brought in contact with them whilst being blown about by the winds; and fruitfulness is the result. If, on the contrary, there are no catkins, or if they are prematurely cut away in pruning, there can be no fruit. Pruning should not be commenced till after the appearance of the crimson stigmas at the apex of such buds as *b b*, and after the full expansion of the catkins. When the latter have fulfilled their purpose, they fall off. After fertilisation, the buds *b b* elongate into a twig much the same as other buds; but towards midsummer the formation of the cluster can be seen. The cluster is always terminal. When catkins are wanting on the cultivated trees, those of the common Hazel, when they are fully expanded, may be hung on the branches.

a a a, wood-buds; *b b*, blossom buds.

The county of Kent has been long celebrated for the production of large crops of Filberts. That mode of pruning must be good which has been successfully practised for generations; and we, therefore, cannot do better than give the method pursued by the Maidstone cultivators, as it is minutely detailed by the Rev. William Williamson in the 4th vol. of the first series of the Transactions of the Horticultural Society. The author of the communication treats the cultivation of the Filbert under the following divisions: *Soil*, *Raising the Plants*, *Manure*, and *Pruning;* which last, he adds, forms the great distinction between the cultivation in Kent and in other counties.

"The suckers are taken from the parent plant generally in the autumn, and planted in nursery beds (being first shortened to 10 or 12 inches), where they remain three or four years. They are slightly pruned every year, in order to form strong lateral shoots, the number of which varies from four to six. But though it is the usual practice to plant the suckers in nursery beds, I would advise every one to plant them where they are to remain, whether they are intended for a garden or a larger plantation; and after being suffered to grow without restraint for three or four years, to cut them down within a few inches of the ground. From the remaining part, if the trees are well rooted in the soil, five or six strong shoots will be produced. Whichever method is practised, the subsequent treatment of the trees will be exactly the same.

"In the second year after cutting down, these shoots are shortened; generally one-third is taken off. If very weak, I would advise that the trees be quite cut down a second time, as in the previous spring; but it would be much better not to cut them down till the trees give evident tokens of their being able to produce shoots of sufficient strength. When they are thus shortened, that they may appear regular, let a small hoop be placed within the branches, to which the shoots are to be fastened at equal distances. By this practice two considerable advantages will be gained—the trees will grow more regular, and the middle will be kept hollow, so as to admit the influence of the sun and air.

"In the third year a shoot will spring from each bud; these must be suffered to grow till the following autumn or fourth year, when they are to be cut off nearly close to the original stem, and the leading shoot of the last year shortened two-thirds.

"In the fifth year several small shoots will arise from the bases of the side branches which were cut off the preceding year; these are produced from small buds, and would not have been emitted had not the branch on which they are situated been shortened, the whole nourishment being carried to the upper part of the branch. It is from these shoots that fruit is to be expected. These productive shoots will in a few years become very numerous, and many of them must be taken off, particularly the strongest, in order to encourage the production of the smaller ones; for those of the former year become so exhausted that they generally decay; but whether decayed or not they are always cut out by the pruner, and a fresh supply must therefore be provided to produce the fruit in the succeeding year. The leading shoot is every year to be shortened two-thirds, or more should the tree be weak, and the whole height of the branches must not exceed 6 feet.

"The method of pruning above detailed might, in a few words, be called a method of spurring, by which bearing shoots are produced, which otherwise would have had no existence. Old trees are easily induced to bear in this manner, by selecting a sufficient number of the main branches, and then cutting the side shoots off nearly close, excepting any should be so situated as not to interfere with the others, and there should be no main branch directed to that particular part. It will, however, be two or three years before the full effect will be produced. By the above method of pruning, 30 cwt. per acre have been grown in particular grounds and in particular years, yet 20 cwt. is considered a large crop, and rather more than half that quantity may be called a more usual one; and even then the crop totally fails three years out of five; so that the annual average quantity cannot be reckoned at more than 5 cwt. per acre.

"When I reflected upon the reason of failure happening so often as three years out of five, it occurred to me that possibly it might arise from the excessive productiveness of the other two. In order to ensure fruit every year, I have usually left a large proportion of those shoots which, from their strength, I suspected would not be so productive of blossom-buds as the shorter ones; leaving them more in a state of nature than is usually done; not pruning them so closely as to weaken the trees by excessive bearing, nor leaving them so entirely to their natural growth as to cause their annual productiveness to be destroyed by a superfluity of wood. These shoots, in the spring of the year, I have usually shortened to a blossom bud."

That style of pruning which is found the best for the Currant, is also considered, in general, the best for the Filbert. The Maidstone growers prefer plants raised from layers, and which have been bedded out in the nursery for two or three years. Each plant should have one strong upright shoot, which after the final planting should be cut back to 18 inches; this will admit of 1 foot of clear stem, above which height shoots should be encouraged, to form the head. Six branches will be a sufficient number. Their leaders should be annually shortened, in order to make them throw out laterals. They should be trained in form of a goblet, or somewhat approaching thereto. This is merely a mechanical operation.

With regard to the management of the laterals, no precise rule can be laid down. It must be varied according to the nature of the soil, and the greater or less humidity of the climate. If the soil is rich and moist, strong shoots, too strong for any but wood-buds being formed on them, will be produced. Instead of the fruitful laterals produced on the Kentish soil, rod-like walking canes will be produced when the plants are grown in many other parts of the kingdom. They must be cut back, otherwise they would form strong cross branches; but then we must consider that each of these rods, with their ample foliage, has contributed to the formation of roots during the summer; that these roots will be adequate to supply nourishment in the following season to all the shoots made in the present season; but when the shoots are necessarily reduced, say more than one half, either by shortening or cutting out entirely, then the remaining portion has more than double the quantity of roots necessary for its nourishment; and it will, in consequence, be stimulated to grow with excessive luxuriance. There are two ways by which the excessive luxuriance may be prevented by pruning, namely, by summer pruning, and by root-pruning.

As the roots are formed by the action of the leaves, it is evident that the fewer leaves there are on a plant during the summer of 1850 the less will be the quantity of roots formed in that period; and just so much diminished will be the contributors to luxuriance for the summer of 1851. By winter pruning we reduce the subjects to be fed, but not the feeders; but by summer pruning we proportionately reduce both, and that to any extent that may be found necessary. Therefore, when the laterals are likely to prove too luxuriant, check them in the early part of the season; when they have made 6 or 8 inches in length, pinch off their tops; and when they push a second time, pinch them back to the first bud formed by the secondary shoot.

In the following spring cut them back to a female blossom bud, if any; but otherwise, spur them nearly close to the branch. By the annual repetition of such proceeding, fruit will ultimately be obtained; and the fruiting will prove a check to over-luxuriance. If root-pruning be resorted to, it should be performed in the autumn.

Suckers should be carefully removed; or rather they should be eradicated as soon as they make their appearance, if this can be done without injuring the roots; otherwise autumn or beginning of winter is the best time for laying bare the roots for some distance round the stem of the tree, and thoroughly clearing off all vestiges of suckers. *R. T.*

VILLA AND SUBURBAN GARDENING.

The practice of what is termed root pruning has of late years attracted a good deal of notice. Root pruning is, however, no modern discovery. It has been followed less or more for a century, and perhaps even longer; but the system of docking the roots, and dwarfing trees, is somewhat new in this country, although well understood in the Celestial Empire. The result of this practice has been the production of stunted, bark-bound trees, the fruit from which partakes more of the character of the wood of the tree than that which we desire to find in a plump well-grown Pear. I therefore take this opportunity of cautioning my amateur readers on a point which, to my personal knowledge, has sadly misled many of them. It may be stated, and in fact recognised as an axiom, that unless a tree is in a kindly growing condition, the fruit will at all times be inferior. Let it not be inferred from this that I mean over-luxuriance; in that case wood alone will be made.

Pears should be generously used when they are first planted; the ground should be in good heart, and manured near the surface. If in the course of a few years the trees indicate a tendency to produce more wood than is desirable either as respects the fruitfulness of the trees, or outgrowing the limits originally assigned them; then cautiously examine the roots, and carefully curtail their exuberance, but this should be done by degrees, and the month of August should be preferred to any other for the operation.

The most important point in the management of Pear trees hinges on the summer pruning; many imagine that when the trees are planted there is nothing more to be done, except picking the fruit. This notion has converted some little gardens into little forests. During summer let the superfluous shoots be stopped back to within 3 inches of the old bearing wood, broken off rather than cut. This will cause flower-buds to be formed at the base of the shoots so treated. The projecting part can be removed in autumn or winter close to the fruit buds; by following this mode of treatment the trees will be kept within a limited space, and their productiveness secured.

The following 25 kinds will furnish ripe fruit for a long time, and all of them are of first-rate excellence.

Jargonelle, August
Dunmore, September
Monsuette, Sept. and Oct.
White Doyenné, Sept. and Oct.
Seckel, October
Louise Bonne, of Jersey, Oct.
Gansel's Bergamot, October and November
Eyewood, Oct. and Nov.
Marie Louise, Oct. and Nov.
Beurré Diel, Oct. and Nov.
Beurré Bosc, Oct. and Nov.
Thompson's, November
Napoleon, Nov. and Dec.
Fovelle, Nov. to Jan.
Glout Morceau, Nov. to Jan.
Hacon's Incomparable, Nov. to Jan.
Chaumontelle, Nov. to Jan.
Ne plus Meuris, Nov. to March
Passe Colmar, Dec. and Jan.
Beurré d'Aremberg, Dec. and Jan.
Winter Nelis, Dec. and Jan.
Knight's Monarch, January
Jean de Witte, Jan. and Feb.
Easter Beurré, Jan. to March.
Beurré Rance, Feb. to April.

Pharo.

Home Correspondence.

Culture of Pine-apples at Trentham.—Since my article on this subject appeared, I have received several letters asking for additional information; and, to prevent others the trouble of writing for the same purpose, I take the liberty of replying to their inquiries through the medium of your journal, at the same time assuring them that I do so with the greatest pleasure. What has caused most enquiry is, the apparent difficulty of obtaining a bottom heat ranging from 80° to 85°, by means of the return pipes from those which supply the top heat of from 60° to 65°; but this matter will appear clear when it is considered that the heat accumulates in the soil, as it can only escape from thence by the surface, and then through the medium of the heated atmosphere. These causes, aided by the foliage of the plants, check radiation, and thus cause the lesser power to maintain the greater heat. On the other hand, the atmosphere loses heat rapidly, by the constant and rapid radiation from the entire surface of the pit. The plan given at page 85 shows that the bottom and top heat are both supplied by one set of pipes, and this causes no inconvenience even in the heat of summer, as at first sight seems probable. It would appear desirable that the pipes for supplying the bottom heat should be separate and distinct from those which supply the top heat, and furnished with stop-taps or valves to regulate it; but, besides adding considerably to the expense of first construction, we find that in practice they are unnecessary, as the bed during summer derives assistance from the sun in nearly the same proportion that the atmosphere of the house does; so that the moderate fire heat necessary on account of the top heat at night, and in dull weather, is nearly sufficient to keep up the bottom heat also; and when more is required, we do not consider it any disadvantage that the top heat is somewhat raised at the same time, as the admission of more air then takes place, and thus the plants enjoy a free circulation of air resembling the breeze of their native isles. We also find in practice that the bottom heat is kept up at an expenditure of fuel very much less if pipes are used than it can by means of tanks; and very little, if any, extra fuel is necessary, on account of the top heat, as the circulation is more active, from its having to pass through the higher ranges of pipes. When there is a separate set of pipes attached to the boiler for keeping up bottom heat, the fires made purposely to keep up the bottom heat require nearly as much fuel as if the water was allowed to circulate through the top pipes also; and if the valves in the top pipes have to be partially closed, to impede the circulation, the heat is not so regular in all parts of the house or pit; and where the circulation is not free and rapid, a greater quantity of fuel is required. One inquirer is anxious to know if any means are used, when the plants are old or large enough, to throw them into fruit, such as drying them off, or keeping them cool any length of time. My answer is, No; we do not adopt any such means. It is effected by following such a course of cultivation, with regard to heat and moisture, light and air, as shall keep the plants progressing, without the slightest check, but at the same time bring them to maturity as quickly as possible. This is only to be managed by liberal ventilation, in company with heat, light, &c., and by such treatment the plants attain sufficient strength to produce fruit, while in size they appear to be mere suckers, excepting that their sturdy vigour, and the curvature of their leaves, show that they are plants indeed. The age of the plants when they show fruit, varies from 14 to 20 months; we have some now showing, which were only planted from the reserve rows in the end of last July, at which time they were probably six or seven months old. He further asks, how we manage to get them up at the periods mentioned. This is done simply by planting some out in every month; in every case selecting the most forward plants from the reserve rows, and taking care also to plant a few suckers at similar intervals. In this way a gradual succession is secured, and the plants throw up their fruit in similar order. Even when a pit is cleared for the purpose of entirely renovating the soil, it is replenished with plants of different ages, so that in no case have we a glut of fruit coming in at any season. The order in which the replanting takes place is so exactly described in page 85 *c*, that it does not seem necessary to repeat it. *G. Fleming.*

Food of Birds.—Your correspondent "A. A.'s" remarks upon the food of certain birds are so erroneous, that I do not think they ought to pass by unnoticed. All the finches feed their young with insects, which also constitute a large proportion of the food of the parent birds during the breeding season. The sparrow is one of the most useful birds in gardens in the spring, destroying immense numbers of caterpillars, particularly those of the winter moth (Cheimatobia brumaria), one of the most troublesome insects we have, the larvæ being general feeders, but particularly injurious to Roses, the young shoots being often quite destroyed by them. The cockchaffer is also eagerly sought after by the sparrow. The chaffinch destroys great numbers of small insects, frequently taking them on the wing like the fly-catcher. The titmice never feed upon the buds of trees; insects form the principal part of their food; but they also feed upon seeds and fruit of various kinds. The ox-eye titmouse does much damage to Peas, and I believe it is the only species of the genus that will eat them. The blue tit is injurious to summer Pears and Apples; I never saw either the cole or marsh tits meddle with fruit. Bullfinches seriously injure fruit trees by picking off the blossom-buds; and sparrows will sometimes feed upon the buds of Currant and Damson trees, but I never knew them attack the Gooseberries. The song thrush destroys immense numbers of shell snails, and on this account is very serviceable in gardens; and although I admit that some birds are destructive at times to the produce of our garden, I am convinced that on the whole they do far more good than harm. *Henry Doubleday, Epping.*

Best time for Felling Larch.—The remarks of "U. L." and those of his carpenter, in your Number of Feb. 9, entirely confirm the theory of "Arborator" as to the proper period for felling the Larch. The decortication of the trees in spring prevented the return of the sap to the root, as effectually as if the trees had been felled. The sap having risen, the tops on which some bark was left, would remain growing during the succeeding summer, as may be noticed by any observer, when Oak or other hard wood is decorticated in the spring. The pruning of Larch is attended with bad effects, as the resin exudes from the wound and produces the Aphis lanifera, which causes the white disease so common on Larch and on Apple trees. [!!!!!] *A Practical Sexagenarian Arborator.*

On the Use of Ammonia in Plant Houses—You well remark (p. 83) "that it is strange that an agent so simple, so easily procured, and applied as ammonia, should be so sparingly employed—at least in a proper manner." Few gardeners who have observed the extraordinary luxuriance exhibited by plants grown in brick pits, heated, and having a regulated supply of this powerful agent in a gaseous form, from "linings" of fermenting horse-dung, will be inclined to doubt its value or hesitate to adopt its use in plant houses when obtained from the more elegant and less bulky, but not less effectual form of the "carbonate." And as many of your readers will, doubtlesss, in the coming season be anxious to test its efficacy, they will find the necessity —whether using the more homely linings, or the salt—of bearing in mind the concluding words of your article on this subject, "that this most advantageous process requires to be conducted with judgment and caution." I have used the carbonate occasionally last season with benefit by applying a small lump of it, moistened, in the way you direct, to the hot pipes; or sometimes I dissolved a small quantity in water, and with it, from a fine rose or the engine, sprinkled the hot pipes and boiler, thereby filling the house with vapour holding the ammonia in solution, which, when condensation took place, conveyed it to the plants somewhat after Nature's own way. While on this subject, I may observe, that of late ammoniacal gas has been used as "more effective, easier of application than tobacco or other established remedies" for the destruction of the insects that infest plants, and some of your readers may be inclined to try it. I would, in this case, even more than the other, urge the caution you recommend, and not until practised in its application, try it, unless on individual, and not the most valuable plants. I have seen specimens subjected to its influence for a very short time, nearly done for. It may, if properly understood and managed, be very effectual, and I know it to be so; but it is "a process that requires to be conducted with judgment and caution;" and in the absence of these I would strongly recommend this "counter-blast" to be avoided, and the innocuous but effectual fumes of tobacco only employed to destroy the tiny plant-suckers. *A. B.*

Sunday Schools.—I was happy to see the remarks of "G." on the mutilations of timber, miscalled pruning it. On looking at the illustrations, I could not help wishing that some publisher would favour the world with a few such, drawn and coloured from Nature, in a style corresponding to "Varty's Graphic Illustrations of Animals." I am far from wishing to undervalue the last-named work, but I think the walls of our Sunday-school rooms would be more profitably covered by such illustrations as I have suggested. Many a country peasant might get hints from such illustrations that would be of infinite value to him in after-life. It is probable that several of the scholars will have to do with trees hereafter, probably very few with elephants or camels. *Diss.*

Worthlessness of the Spanish Chestnut as Timber.—I am desirous to record, for the benefit of others, the disappointment I have experienced in Spanish Chestnut timber. I had two fine trees of this Chestnut which I felled a few years ago, and had them sawn into boards and thick planks. When the timber was cut I was pleased with its appearance; but after it had been sawn about a twelvemonth, as it got dry, the boards began to split and part into many slips and pieces; even planks 5 inches thick have parted in many places throughout their whole length though they have never been used, but have lain upon a floor untouched. The cause appears to be a want of cohesion between the annual circles of growth, for as the boards dry they part along the lines of growth. A slice of Onion, which would fall into a series of rings, would not be an inappropriate, (though not quite literal) representation of a section of this wood. My father like many others had been led to believe this to be excellent timber, and consequently planted a good deal of it; but finding trees 20 years old only to part into rings in this way, I have had the mortification of rooting up a great many. The soil in which they were grown is the conglomerate, above the old red sandstone. *U. L.* [This statement of course refers to the real Spanish Chestnut; not to the timber often called Chestnut when found in old buildings, which is the produce of the sessile-fruited Oak.]

Melons.—I believe that few things have interested the majority of your readers so much as the remarks on Peas and Beans, and the list of select flower and kitchen garden seeds. In looking over the latter, however, I was rather surprised at the omission of all mention of Cucumbers and Melons; for a young gardener who can cultivate no more than about four or five lights of Melons to make a judicious selection of the kinds from the great number now advertised would, I conceive, be rather a puzzling affair. Now, I beg to state that I have cultivated many of those kinds, but the two which have always given the greatest satisfaction to my employer and myself are Cuthill's Early Scarlet-flesh (this Melon may be made, with little difficulty, to ripen a good crop of fine fruit in the month of May), and the true Beechwood. *W. Sherwood, Englefield-green, Surrey.*

Tackle for Raising Blown Down Trees.—About seven years ago a large Acacia was blown down on its side here. In order to raise it up again, a sort of machine used by bargemen, called "a jack" was employed for the purpose with complete success. Of course many persons were required to raise it gradually, after a very large hole had been dug all round it to receive its roots. A plentiful quantity of water was poured in, and it was supported by props for a year, but it is now growing vigorously, although one of the roots was broken. *H. M.*

——A much larger, and probably much older Cedar (above 100 years old), than that mentioned at p. 88 was blown down here in the year 1810, and put up again, after cutting off the broken and maimed branches, with perfect success. It is still flourishing, having put out fresh branches and borne fruit on them. It was pulled up by means of triangle and pulleys by oxen. It was thought a hopeless operation when down. The tree was too fine a one and too valuable not to make the attempt. *F. D.*

——The following kind of apparatus is of the simplest construction, but is capable of raising a great weight; I used it in raising large trees last spring. After pro-

viding strong ropes, and nine strong poles, about 15 feet in length, and 10 inches in diameter, I had them placed in threes, each three forming a triangle, and each triangle placed so as to form an equilateral one with the prostrate tree as a centre; a double block with pulleys was hung at the top of the triangle, and through this the rope lifting the tree was passed. A roller of wood was then placed across the two poles most distant from the tree, and round that the rope was wound by hand-spikes. The roller will require to be about 8 inches in diameter, secured at the ends by a hoop of iron, and there should be a teeth wheel at one end, with a latch, to hold every inch as it is gained; only two triangles are necessary for raising, but to prevent the tree, after it has been brought perpendicular, from getting beyond that position, it is necessary to be provided with the means of prevention, for if it is allowed to swing too far it will injure the roots. The raising is, however, the easiest part of the operation. To ensure the tree being preserved, great care will be necessary to prevent it from being shaken by winds before it has made fresh roots; an iron collar should be put round it sufficiently high to resist the force of the storm. Three chains should be fixed to the collar (still forming a triangle), and properly secured in the ground, and the farther they are away from the base of the tree, the more powerful they will prove; a joining screw should be attached to the chains, so that they may be made tight at pleasure. It will be necessary to get some fine light soil well-watered in, so that there may be no hollows allowed to remain among the roots, for much of the success of the operation depends upon this. *A.*

Victoria Regia at Chatsworth.—It will be gratifying to learn that two fine young seedling plants of the Victoria at Chatsworth have come up in the immediate neighbourhood of the parent plant, which is still flowering and doing well. *Joseph Paxton, Feb.* 13.

Descent of the Sap in Plants.—With a view to prove that the sap of Vines would retrogade under certain conditions, I inarched the top of a young Vine, growing in a pot, on to the young wood of a spur of an old Vine which was growing in a Vinery, and as soon as the union of the two had completely taken place, I rubbed off all the buds on the young Vine but the lowest bud next the pot, which I left to grow. Day after day I then continued cutting through this young Vine close under the remaining bud, until it was quite separated from the root in the pot. The shoot from the bud went on growing, and at the same time throwing down a large amount of woody matter at the cut part, just where it started from; but there did not appear to be any enlargement on the lower lip of the cut, nor in the stem of the young Vine through which the sap was retrograding, either while the separation was being performed or afterwards. *John Caie.*

Medlar Jelly.—Take quite ripe medlars, wash them and put them into a preserving pan with as much water as will cover them; let them simmer slowly until they become quite a pulp, and then strain through a jelly-bag. To every pint of the liquor add three-quarters of a pound of lump sugar; boil it an hour until quite clear and a good jelly; put it into pots when cold. *L.*

Fuchsia spectabilis.—As much difficulty has been experienced not only in growing this Fuchsia, but even in keeping it alive, I am induced to state the favourable course I have pursued. I ordered my plant of Messrs. Veitch, and shortly after receiving it I observed that its leaves and stems were mildewed; and to check the progress of the mildew I placed the plant in a well ventilated greenhouse, as close as possible to the window, but rather shaded from above by high Rhododendrons, &c., in flower. Here it had all the benefit of the air I possibly could give, with occasional syringings when the sun was off it. It soon improved under this treatment, and grew rapidly; and although the mildew did not entirely vanish, yet it did not seem to effect much injury. It was potted and repotted in light loam, and is now in an 8-inch pot (it was a very small plant when received), 2 feet high, with six stems, the shortest (except one which had its top taken off for a cutting, and which is broken into two shoots), being about 19 inches; some of its leaves (with the foot stalk, which is an inch long), are 6½ inches in length. In July I took off two cuttings, struck them in an old spent hot-bed, and then gave them the same treatment as before, placing them upon a shelf to receive the air directly as it entered the house from the open window. During the winter they have received no fire heat, except whilst the frost was with us; they have been kept dry, but not so much so as to produce injury; but they have had as much air as the weather would permit. The young wood and the leaves in parts are still infested with a little mildew, but not near so much as when the frost was on, with the fire heat, and the house shut up. *H. W., Tulse-hill, Brixton.*

Origin of Hamburgh Grapes.—I am very much disposed to concur with the late Mr. Dias Santos, as to the etymology of Hamburgh Grapes. I have some Vines nearly 100 years old of that sort. They were, by the net-work style of forcing, covering the entire roof with small wood reduced to the size of small Cluster Grapes; but pruning and the Polmaise have brought them to the size, quality, and flavour of the Grapes of Castile, and other parts of the Peninsula. I also agree with him about the poultry. The noble breed named Hamburgh never could originate there, but must have been transported from some southern region. *W.*

Gardeners' Advertisements.—I observe not less than 30 advertisements for employment as gardeners or bailiffs, or in both capacities, in your Paper of last week; and I beg to say I think it a great mistake of such advertisers that they do not mention their terms. This item, in addition, would certainly lead to more frequent enquiries, and facilitate engagements. I am wanting a working superintendent for a small occupation, and neither dare insert an advertisement on account of the inundation of applicants, nor answer one from the absence of this point. In fact, I see no way of providing myself but in the home market, Scotland, unless this mode of advertising is adopted. I throw out this hint as alike beneficial to employer and employed. *A Derbyshire Subscriber.* [We have repeatedly pointed out the same error, but without any effect upon the advertisers.]

Societies.

Botanical of Edinburgh, *Jan.* 10.—The President in the chair. The following papers were read: 1. *On the British Species of Chara*, by Charles C. Babington, M. A., F. L. S., &c.—The author stated that having been enabled, through the kindness of Professor Henslow, to examine a set of foreign specimens sent by M. Braun, he had been induced to attempt an arrangement of our native species in a more complete manner than had yet been done. The British species described by Mr. Babington are 16, 10 being under section Nitella, and six under Chara. Dr. Balfour illustrated the paper by some large drawings and figures. 2. *On the Watery Secretion of the Ice Plant*, Mesembryanthemum crystallinum, L., by Dr. Augustus Vœlcker, Professor of Chemistry in the Royal Agricultural College, Cirencester.—The author stated that he had only determined the chief ingredients of the fluid, not being able to make a quantitative analysis, owing to the small amount of liquid at his disposal. He found that the fluid contained organic matter, partly albumen and oxalic acid, chloride of sodium, potash, magnesia, and sulphuric acid. 3. *List of Plants found in the Island of Rathlin*, by Miss C. Gage.—The picturesque and interesting island of Rathlin or Raghery is situated off the coast of Antrim, being 3 miles distant from the promontory of Fairhead, on the mainland, and nearly 5½ miles from Ballycastle. In its geological formation it is basaltic, and presents fine cliffs, with some remarkable columns, more especially at Doon point, on the south-eastern side. It is about five miles in length, and varies from half a mile to a mile and a half in breadth. It is interesting in a historical point of view, particularly in connection with the adventures of Robert the Bruce, the ruins of whose castle are situated on the eastern part of the island. Among the plants noticed were Galium pusillum, Cuscuta epilinum, Scilla verna, Elatine hexandra, Sedum reflexum, and S. Rhodiola, Lavatera arborea, Hypericum Androsœmum, Malaxis paludosa, Eriocaulon septangulare, &c. From Miss Gage's list there would appear to be nearly 300 phanerogamous plants and ferns in the island.—Dr. Cleghorn exhibited the fruit of Hydnocarpus inebrians, which is used for poisoning fish in Malabar, lamp oil being extracted from the seeds; a drawing of Erythropsis Roxburghiana, and also the fruit of Sterculia fœtida. Mr. M'Nab exhibited a specimen of the spathe and flowering spadix of Euterpe montana (Mountain Cabbage Palm), and noticed the rapidity with which the branched spadix is developed. It would appear that the branches of the spadix are confined by the spathe until their resiliency bursts it, and the branches at once spread out at right angles from the common rachis. Dr. Balfour exhibited a specimen of Wood Hyacinth, gathered by Mr. John Jeffrey, in which all the bracts were converted into green leaves, many of them 4 or 5 inches long, and ⅛ in. broad, giving the plant a very peculiar aspect. A letter was read from Mr. Hailstone, mentioning that he had gathered specimens of Cynosurus echinatus near Thorpe Arch, Yorkshire. Miss Gage, Rathlin, was elected an extraordinary member.

Reviews.

Gattungen einzelliger Algen, physiologisch und systematisch bearbeitet. Von Carl Nägeli. Zurich, 1849. Pp. viii. and 139; tab. 8.

In noticing Nägeli's former work on the more recent systems of Algæ, though we were anxious to pay a proper tribute to his real merit, we declared ourselves strongly against the crudity of his views and the rashness with which, after a very imperfect study of the subject, he had pronounced his dogmata. Our criticism is completely justified by the present publication, which, amidst a mass of the strangest confusion and ill-conceived definitions, contains very little that will repay the trouble of wading through statements which a moment's consideration is sufficient to overthrow. To the student it is a mere perplexing maze, and the more practised algologist will grudge the labour of gleaning the few grains of corn which it contains.

It is quite out of our province to enter into details, but we cannot help referring to the excellent remarks contained in the *Botanische Zeitung*, of Oct. 12, 1849, a journal conducted in an admirable spirit, and with just and sober views, and which cannot fail to have a very salutary influence on the rising botanists of Germany. In the present instance we rejoice greatly that the Editor has exposed the folly of generalising at every step, without any tolerable knowledge of the needful premises, and the absurdity of pompous laws on every minute distinction, laws which are often the merest truisms, or which fail at once on any attempt to apply them. We suppose that this form of writing is considered the indication of superior mind by some, or it would not be so frequently adopted; but in our estimation few things are worse than semi-metaphysics. Happily a taste of this kind has not sprung up amongst ourselves, and the philosophy of Oken has appeared in so very unattractive a form, as dressed up by the Ray Society, that our young botanists are not at present likely to be Okenised.

Miscellaneous.

On Chicory Coffee; its History, Manufacture, Adulterations, and means of detecting them. By A. Chevalier, in Journ. de Pharm., July, 1849.—In a memoir upon Coffee, by M. Payssé, some details are given on the preparation of Chicory-coffee in Holland. These were printed by Parmentier in the "Annales de Chimie," for 1806, and are as follows: "The Chicory for this purpose is collected in spring; the roots are conveyed to the manufactory, stripped of their leaves and washed to remove the soil.* They are cut into six parts, and then divided and dried. When dry, they are roasted in great cylinders like Coffee. After the roasting, the Chicory is reduced to a coarse powder. In Holland this Chicory is then mixed in variable proportions with Coffee; the resulting product is very bitter, which is considered by the common people to be a very salutary refreshment, which modifies the stimulant action of the Coffee. Such a favourable idea has been formed of it, that of late this preparation has been employed alone, without any addition of Coffee; and nevertheless it possesses no other virtue than that of colouring more or less readily the water in which it is boiled or infused, of communicating to the liquid the bitter taste of the extractive substances contained in Chicory, and of being far less expensive than Coffee." M. Payssé adds, that "Peas, Lupins, Beans, Beet-root, Carrot, &c., have been employed as a substitute for Coffee." The manufacture of Chicory-coffee, however, remained for a long time stationary and of little importance; but for the last 20 years it has extended considerably, and has become an object of commerce of great importance. Till within the last few years it was carried on principally near Valenciennes; but since then manufactories have sprung up in several localities, especially at Arras, Cambray, Lille, Paris, Senlis in Normandy, Brittany, and in England.† The cultivation of Chicory, to obtain the root for the purpose of converting it into Coffee, has become a source of great prosperity for these districts. The plant requires a deep soil of good quality, and well prepared; the seed is sown in May, and the harvest takes place in October. Some time before collecting the roots, the leaves are mowed, and cows fed with them.‡ The roots are dug up with a spade, placed in heaps, and covered with straw to preserve them from frost. The roots, thus collected, are cut at first longitudinally, and then transversely, in pieces from 5 to 10 centimetres in size; they are then carried into the drying chambers, which are heated with a kind of anthracite which produces no smoke. The roots are placed in layers of about 40 centimetres; they are frequently stirred to prevent them from burning and to facilitate the drying. Four such operations are made in about 24 hours. The roots dried by the above process are known by the name of *Cossètes.* They are kept in granaries; but in general sold almost immediately to the manufacturers, who roast them according to the demand. When the roasting is complete, 2 per cent. of butter is added, and a couple of turns given to the roasting machine. This addition is made in order to impart lustre to the Chicory, and to give it the appearance of roasted Coffee. The substance is then emptied into iron vessels, and after cooling is crushed in vertical stone mills, or between iron cylinders; it is then sifted, and during this operation a small quantity of a reddish colouring substance (*rouge brun de Prusse*), is added to give it the colour of Coffee. The product is then weighed off, and sold in packets under a variety of names, but very rarely under its own; for instance, among others, Mocha Powder, Ladies' Coffee, Cream of Mocha, Pectoral Coffee, Chinese Coffee, Tom Thumb Coffee, Polka Coffee, and Colonial Coffee. We have stated that it forms a very important object of commerce; in fact, 12,000,000 lbs. are consumed in France, and a large quantity is exported. On consulting the tables of the commerce of France, it will be seen that from 1827 to 1836 there was exported from France 458,971 kilogrammes of Chicory-coffee of the value of 321,282 francs; and since this period the amount has vastly increased. *Adulteration.*—This substance is very frequently mixed with other ingredients, the means for detecting which consequently vary. We shall briefly notice them. 1. Brick-dust, ochre, and earth may be detected by incineration and determining the amount of ash; 100 grms. of pure Chicory-coffee furnish from 4 to 5 per cent. of residue; an excess would indicate fraud. 2. Adulteration with Coffee-grounds. This is carried on upon a great scale in Paris. It is easily detected. A sample of the suspected Chicory is dried in a water-bath, and a pinch thrown upon the surface of a glass of water; the Chicory almost immediately absorbs the water and sinks to the bottom of the vessel, whilst the Coffee-grounds remain on the surface. 3. Adulteration with roasted bread, dirt, and remains from vermicelli, &c. This adulteration is generally made with the crusts of bread collected in the streets, crusts which are not always very clean. They are roasted or rather burnt in the oven, ground, and mixed with the Chicory powder. This adulteration can be detected by iodine-water, as the

* The roots are now no longer washed, as this operation is said to injure their value.

† For the last two years very large quantities of dry Chicory have been exported from France into England.

‡ It forms an excellent fodder, but when given alone communicates a very disagreeable flavour to the milk of the animals.

product resulting from the decoction of pure Chicory does not strike a blue colour. 4. Adulteration with roasted Acorns, which may be detected by iodine-water and by persulphate of iron, which in such a case strikes a black colour. 5. Adulteration with roasted corn, Haricots, and Peas, may be detected by means of iodine-water. There is no method as yet known of detecting the adulteration by roasted Beet-root and Carrot. *Chemical Gazette.*

Calendar of Operations.

(For the ensuing week.)

GENERAL REMARKS.

Do not allow a labouring man to be exposed to heavy rains, by which he is liable to have his health injured, and his constitution weakened. In such cases it were far greater charity to send him home until the weather is fit for him to work; but this is seldom necessary in a well regulated place, as there is abundance of work which may be performed under cover, and which will facilitate other operations, when better weather permits them to be undertaken. Among these may be mentioned, making besoms, Orchid baskets, and rustic ornaments for the flower garden and shrubbery in summer; making, painting, and writing or printing labels; washing and painting sashes and other woodwork; washing pots, breaking crocks, tying mats, cleaning and training plants, sorting roots and fruits, and preparing Potato sets. To carry on such work to the best advantage, a sufficient stock of the requisite tools and materials should always be kept ready, that the men may be turned in to the work at a moment's notice. If this precaution be not taken, much of the time which ought to be occupied in doing the work will be lost in setting about it.

PLANT DEPARTMENT.

Many stove plants, especially of the soft-wooded, free-growing kinds, may now with advantage be placed in a moderate bottom-heat for a week or two, to set the roots in motion, before they are repotted; this will prepare them to take immediate advantage of the fresh compost. Get all plant trellises painted, that they may be ready for use when required. Besides conducing to their preservation and neat appearance, the paint effectually smothers any insec s or eggs which may be lurking about them. Active exertions should now be made to eradicate scale, mealy bug, or other insects with which any of the plants (particularly those in the stoves), are infested. Hot water is the best remedy; it may be safely used at 130°, and even higher. It may undoubtedly be applied much hotter, at this season, on the old well-ripened shoots and leaves, than would be safe a month or six weeks hence, when the plants have commenced their new growth. Insects of all kinds are eradicated with much greater ease at this season, when they are, comparatively speaking, in a dormant state, than they can be a few months hence.

FORCING DEPARTMENT.

In clear fine weather assist Nature by giving some additional heat to all the Pineries, as well as to the Vineries and Peach-houses, now in operation. This increase, accompanied by a proportional circulation of air, by means of the ventilators, will be very beneficial; but during dull cloudy weather it is advisable to be sparing of artificial heat, for the double purpose of husbanding the energies of the plants and preventing the needless waste of that expensive article fuel. Avoid too moist an atmosphere in the Pineries, or some of the shows will be liable to come without their crowns; and be very careful in syringing not to allow any moisture to fall upon the flowers. A little neglect on these points, added to a deficient circulation of air, is productive of monstrous crowns, and frequently of deformed fruit. A slight syringing may be given about 3 P.M., to Peaches which are fairly set; but with caution, for much splashing of water at this season is injurious both to roots and branches. Leave a small portion of air on at all times.

FLOWER GARDEN AND SHRUBBERIES.

It is a frequent practice to leave a circle of bare ground round specimen trees and shrubs. This is done to afford greater facilities for top-dressing with manure or compost, and for loosening the ground to admit the sun and air more freely. The effect, however, is not so pleasing as when the turf is continued close up to the plant, and it is besides much more troublesome to keep in order; and for this reason, as soon as the plants are thoroughly established, and have begun to grow freely, the bare ground should be entirely turfed over. In small gardens, it is a common practice to cultivate flowers in and round the shrubbery beds; and though scarcely in good taste, to make similar use of the circles round single specimens, rather than allow them to be covered with turf; in such cases let some leaf soil be dug or forked in, to stimulate the plants into vigorous growth. When planting the flowers in these beds, it should be borne in mind to keep a space quite clear between them and the base of the specimen. We have often seen the lower branches of fastigiate trees entirely spoiled by neglect on this point.

FLORISTS' FLOWERS.

Polyanthuses.—We usually sow the seed before this time; but in consequence of the unpropitious weather, we, like many of our readers, have been obliged to defer it till now. We find nothing better in the way of compost than an old Carnation soil. We sometimes endeavour to keep old stools of our best varieties of Carnations and Picotees over for propagation; and it will sometimes happen, with our best endeavours, that some will perish in the winter. The compost in which they grew comes in very well for our purpose; we have square earthenware pans, or sometimes raisin boxes, which may be bought cheaply at the grocer's; these we fill with the compost before alluded to, first passing it through a wire sieve, putting all the coarse portions at bottom for drainage—keeping, also, a sharp look-out for worms, which are to be carefully picked out. After filling level with the edge of the box or pan, we allow it to settle, and the following day sprinkle the seed carefully on the surface, barely covering it with the soil; they should then be placed in a cold frame, keeping them from excessive wet. Auriculas.—In consequence of the past severe weather, these plants appear to be retarded; this will be all in favour of a good bloom. Give more water and air on every favourable occasion; warm, gentle showers will be highly beneficial. Pansies in pots for early spring flowering should now be top dressed with rich compost; buds which will be too forward may be removed, and the pots placed on a stratum of ashes in a fresh frame; keeping the lights off in all favourable weather, and giving occasional waterings with weak liquid manure. Cover Tulips which have now appeared above ground, whenever there is the least indication of frost. Take up cuttings of early forced Dahlias and strike in heat, and place old roots in hot water pits or dung beds, to forward them for the same purpose.

HARDY FRUIT GARDEN.

It is a common thing to see gardens crowded with large fruit trees, most of which are inferior or worthless varieties, and even the good ones, from want of proper management, are generally unproductive; besides which, their roots exhaust the ground and their tops shade it, thereby preventing the proper development of other vegetables. This system should be altogether changed; all inferior varieties should be removed, and of the remaining ones the standards should be drawn down, if they will bear it, and the dwarfs trained as pyramidal or goblet shaped bushes. If the soil is rich, which may be naturally expected amongst vegetables, the production of gross and superfluous wood should be prevented by regular and systematic root pruning. The most economical arrangement of fruit trees for a garden is to form espaliers on the south side of all walks running east and west, and on both sides of all walks running north and south. On these all the fruit trees, including Gooseberries, Currants, and Raspberries, should be trained, and the whole available space of the garden will be left for vegetables. It will be necessary to support the fruit trees with stakes for a few years, after which they will support themselves. We mention this now, as all planting of fruit trees should be completed as soon as possible.

KITCHEN GARDEN.

Draw up ridges of soil on each side of the rows of early Peas which are above ground, in order to protect them from cold sweeping winds; it will be as well, also, to put the stakes to them at once, and by using the small spray to fill up the bottom it will contribute to their more perfect protection. Care must be taken to prevent the ravages of mice and birds; rats also frequently attack broad Beans just as they are starting, and if not noticed in time, they will destroy the crop.

State of the Weather near London, for the week ending Feb. 14, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 23d 1846—therm. 58 deg.; and the lowest on 19th, 1845—therm. 16 deg.

Notices to Correspondents.

Abalia japonica: *O L.* Like all plants which bleed excessively, the best time for pruning this will probably be *when in full growth.* At that time the leaves consume the sap as fast as it rises, and prevent its discharge through the wound. Try one shoot first, and if that succeeds the others may follow. The bleeding of the Vine, the Walnut, and the like, is nothing, when those plants are making wood rapidly.

Azaleas: *Weeks and Co.* Our opinion is that the seedling is not worth growing. As to earliness, it is six weeks behind the common white; nor is it so good in form of flower. The character of "flowers in threes" is not very likely to last.

Books: *R S.* We should imagine that Glenny's "Handbook to the Flower Garden and Greenhouse" would exactly suit you. It is new and contains a great deal of useful information concerning common things.—*M L S.* Dr. Lindley's "School Botany," "Elements of Botany" *complete*, and "Vegetable Kingdom" will form a sufficient botanical library for you, if you do not want mere details of genera and species.—*Alexander.* Babington's "Manual." A common pocket lens or object glass will answer your purpose; but to be able to dissect under it you must have a stand for it. The latter may consist of an upright support fixed into a square piece of wood sufficiently heavy to keep the apparatus steady. The lens should have a hole through its handle, so as to enable it to be passed over the top of the support, which should be shouldered or notched to keep it from slipping too far down the support. ‡

British Orchids: We regret to say that we cannot insert the inquiry in any other than the following form: Miss L. S. Fuller, of Hall-lands, Nutfield, Reigate, will be obliged to any correspondent who can send her roots of the following British orchids, directed to be left at the Meestham station: Conopsea (gnat-like), Conopsea alba, Viridis (green frog), Albida, Papilionacea indivisa, Simia, Variegata, Smithii militaris, Fusca (brown-winged lady), Tephrosanthos, Hircina, Fucifera (drone bearing), Aranifera, Arachnites, Monorchis, Goodyera Cordata, Serapias latifolia, Palustris, Epipactis ensifolia, Scrapias rubra, Corallorrhiza innata, Malaxis Læselii, Calceolus.

Cryptomeria: *A Correspondent* will thank some of our readers to inform him whether or not there are two varieties of Cryptomeria japonica. He states that the first plants received turn brown and russety during the winter season, while others more recently obtained are of a beautiful verdant green, not showing the least change in their colour; in fact, that a difference is traceable throughout the whole year.

Fern: *L.* You may remove it, with great care, by digging deep enough; but you must remember that what are called roots are merely underground stems; the real roots are the black fibres, all of which should be preserved.

Grasses: *Grasshopper.* You cannot have good turf under the heavy shade of trees. Grasses may be made to grow, but they are always shabby in such places. Cannot you thin your trees? If not, it would be better to cover the ground with the common Periwinkle, which is hardy, and will thrive under trees.

Insects: *Constant Sub.* The insects sent are the larvæ of a species of beetle (Tenebrio molitor), commonly called mealworms, from devouring meal, bran, flour, &c. The only mode of extirpation is by carefully sweeping the crevices of the apartment, or by turning a guinea pig in. *W.—W H C N.* The insect is the beetle named Elater lineatus, *Gardeners' Chronicle*, 1845, p. 344. The progeny of it is the common wireworm. Find all you can, and kill all you find. 1, a plant attacked by, 2, the wireworm; 3, the wireworm magnified; 4, the perfect beetle Elater lineatus; 5, the same magnified. *W.*

Labourers: *Constant Reader.* No answer can be given to such inquiries. With very skilful management and good men, a garden may be kept in perfect order with a number of labourers which, under another kind of management, would be wholly insufficient. We have in our eye a place which, some years ago, was worse kept with 36 men than it now is with 20. A good deal depends, too, upon the demands of the household. There is a place in one of the western counties, very like what you describe, which is kept in admirable order, with 11 good men under a skilful gardener. But he is a man of a thousand.

Names of Fruits: *E A M.* The Pear is not known; it is very handsome, russet and very bright red, but scarcely first-rate.‖

Names of Plants: *Ilex.* The Holly leaves are overgrown with a plant called Chlorococcus viridis, in consequence of the dampness to which they are exposed. It will disappear when the Holly sheds its leaves.—*P B.* Rogiera amœna, alias Rondeletia thyrsoidea; a variety of Gongora maculata; Vanda furva.—*Erzeroum.* A thousand thanks. Box just unpacked. Very nice things. You shall hear about some of them presently.

Poplars: *Arborator* inquires, "What is the cause of the general premature decay of the Black Italian Poplar?"

Potatoes: *Enquirer.* A cross between a common Potato and a sweet Carolina Potato! Whoever heard of such an impossibility? Your sweet Potato had probably been growing before it was boiled, or else it had been frozen.

Resinous Trees: *C Z.* The worst time to prune them is in the spring, when they are beginning to grow—the safest in autumn or winter. If you desire to remove the heads of your Firs, do so at the latter season. But had you not better top some, and leave others untouched?

Roses: *An old Sub.* You may plant Roses deeper than many other plants; but it is best to keep the roots within ready reach of the air. Instead of sinking the roots, why cannot you make the earth into small mounds, and put them over them?

Rubia: *M.* Thanks. It would be a proper subject of exhibition in the great affair of 1851, provided it can be had in quantity.

Seeds: *A Sub.* We are sorry to be obliged to say that we *cannot* recommend one seedsman rather than another. Any seedsman of respectability can furnish what you require. If he does not happen to keep them he can obtain them from his London correspondent. There is no difficulty among respectable seedsmen.

Shrubs: *G.* No shrubs will grow well under Beech trees; you may, however, try common Laurels, Hollies, Junipers, Box, Laurestinus, and Privet.‡—*D S.* All kinds of shrubs will succeed on chalk, provided there is sufficient soil above it for them to grow in; if you have only a very thin layer of soil on the chalk, then try such things as Junipers, Box, Yew, Berberis, Phillyreas, &c.‡

Vines: *W T.* Your Vines being young, vigorous, but bad sorts, it will be advisable to graft them. This should be done as soon as they have fairly broken into leaf.‖—*Q.* The Early Black July, Royal Muscadine, Miller's Burgundy, Pitmaston's White Cluster, Black Burgundy, are sorts that will ripen in the open air in this climate in favourable situations. No sort ripens its fruit and matures its wood out of doors in this country so perfectly as the Black Burgundy, and from it the best wine can be made.‖

Misc: *B S.* It is not uncommon for Boronia serrulata to assume a brown colour in winter, and for some of its leaves to drop off; but yours may be wrong at the roots. You had better look to the drainage. The best soil for it is rough peat mixed with a little sharp sand. After potting, it should be placed in the warmest end of your greenhouse. Mildew is easily recognised by its white powder-like appearance. Attack it with sulphur the moment it appears. You will be right in placing your Camellias in 60° moist heat.‡—*C S V W.* Do not be alarmed at your Polypodium aureum casting some of its fronds; if it is healthy it will produce young ones to take their places. Pot your Camellias when they have done blooming, and place them in a moist heat of 60° while they are making their new wood; after that, harden them off by degrees. ‡—*Ilex.* We are not in possession of the dimensions of the machine you mention.‡

Erratum: Under the head "Linnæan Society," in last week's Paper, p. 87, second line from the beginning, instead of "W. Febitt," *read* "W. Tebbitt."

GENUINE PERUVIAN GUANO, direct from the Importer's Stores, LINSEED CAKES, and all kinds of Artificial Manures, may be had at London prices, for Cash, of Messrs. Odams and Pickford, 15, Mark-lane, London.

THE LONDON MANURE COMPANY beg to offer as under, and pledge themselves that every Manure shall be perfectly Genuine:—Corn Manure for Wheat, Barley, Oats, Clover—most strongly recommended from its success last year; it will be found cheaper than Guano, and bear the strictest analysis. Also URATE, Superphosphate of Lime, Sulphate and Phosphate of Ammonia, Nitrate Soda, Fishery and other Salt, Gypsum, Sulphuric Acid, &c.

GENUINE PERUVIAN GUANO.—To insure this free from adulteration, all purchasers, if they prefer it, can receive their warrants from Mr. Purser, and remove the Guano direct from the Warehouses of Messrs. A. Gibbs and Sons, the Importers.

Bridge-street, Blackfriars. Edward Purser, Secretary.

Country Dealers and Agents supplied.

GUANO AND OTHER MANURES.

PERUVIAN GUANO of the finest quality (as imported by the Contractors) on Sale; also Superphosphate of Lime, Gypsum, Nitrate of Soda, Salt, and all other Manures of known value.—Apply to Mark Fothergill, 201A, Upper Thames-street, London.

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

SEEDS.—FOR SALE, some cwts. of SKIRVING'S SWEDISH TURNIP, WHITE BELGIAN CARROT, and ORANGE GLOBE MANGOLD WURZEL SEEDS; ripened last summer on Whitfield Farm, near Berkeley, Gloucestershire, at 8*s.*, 6*s.*, and 9*s.* per imperial stone, respectively.

Apply to Mr. Morton, Whitfield Farm.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, and CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

Stratton, Hughes, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. Stratton, Hughes, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1*s.* 6*d.* in postage stamps.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL and Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained two Silver Medal Prizes, and is the Felt solely patronised and adopted by

Her Majesty's Woods and Forests,
Honourable Board of Ordnance,
Honourable East India Company,
Honourable Commissioners of Customs,
Her Majesty's Estate, Isle of Wight,
Royal Botanic Gardens, Regent's Park,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the Royal Agricultural Society's House, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

Price One Penny Per Square Foot.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL and CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'Neill and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

Note.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

NATURAL GRASS SEEDS, for PERMANENT PASTURES, AND IRRIGATED OR CATCH MEADOW.

Which may be had Separate, or Mixed, expressly to suit the soil.

MESSRS. JOHN SUTTON and SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of various kinds of Grasses which grow naturally in the various soils of England and Wales, for the purpose of introducing an improved system of laying down land to permanent pasture, are thereby enabled to supply the sorts and quantities of Seeds best adapted to suit the soil for which they are intended; and *at much less expense* than is usually incurred. Particulars will be forwarded by post.

Also Finest Lawn Grasses and Mixtures for improving old Pastures. Ashcroft, Liverpool, and other Swedes, White Belgian and other Carrots, Yellow Globe and other Mangolds, True Italian Rye-grass, Drumhead Cow Cabbage, Kohl Rabi, &c.

Reading Seed Warehouse, Reading, Berks.

The Agricultural Gazette.

SATURDAY, FEBRUARY 16, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday,	Feb.	20—Agricultural Society of England.
Thursday,	—	21—Agricultural Imp. Society of Ireland.
Wednesday,	—	27—Agricultural Society of England.
Thursday,	—	28—Agricultural Imp. Society of Ireland.

There are two ways in which a model proposed for imitation will be examined. Some, after the manner of the Chinese tailor, will attempt to copy it literally, to the very "darns" of the specimen before them; or, failing their ability to do that, will loudly deny its suitableness as an example for them: others will aim at imitating, not so much the details, as the enterprise and the intelligence to which they have been owing. Auchness Farm will be looked upon by such as an admirable instance of profit arising from an energetic attention to, and a skilful use of circumstances; both of which are perfectly imitable and always profitable, whether the precise conditions of the case exist elsewhere or not.

We have never met with a more excellent illustration of this truth than is presented in the pamphlet just published by Mr. Caird, of Baldoon, in answer to the numerous criticisms which his "High Farming" had received.* But it is not a vindication of this kind alone, of which his previous publication is here proved to be susceptible. A balance sheet for the year is given in the pamphlet before us, and the profits and expenses of Potato culture are compared with those of a more ordinary green crop cultivation, so as to show that Mr. M'Culloch's experience of agricultural profit is not incompatible with the Potato-rot and Wheat at 5*s.* per bushel.

We only add that Mr. Caird's second pamphlet deserves to be widely read, if for nothing else, as an exceedingly happy specimen of good controversial writing. He had been roughly and in some cases contemptuously treated by the reviewers of his original publication; men in high agricultural stations scrupled not to speak of the "silly pamphlet" of the young Wigtonshire farmer: we venture to predict that whoever may assail him for the future will give him credit not only for equal skill and talent with any who have hitherto contributed to our agricultural literature, but for that common sense too which his opponents hitherto have claimed for themselves. We have never read a pamphlet which proved in its author a happier union of intelligence and skill as a practical farmer with wit and ability as a literary man.

At a general meeting of the Highland and Agricultural Society, held lately, a report was made by the directors, recommending that tenant-farmers who are members of any local agricultural association should be admitted to the Society on a reduced scale of charges. The terms of the recommendation are to the effect that the annual subscription for tenant-farmers shall henceforth be only 10*s.* instead of 1*l.* 3*s.* 6*d.*, with the power of redemption at five guineas instead of 12 guineas as formerly. A recommendation, similar to this, was made by ourselves last year in a leading article, and we are glad to find that the directors have taken up the matter in such a manner as will likely lead to the recommendation being adopted. If it be accepted, of which there seems little doubt, a highly advantageous opportunity of joining the Highland and Agricultural Society will be afforded to every farmer who is already, or may become, a member of a local Society.

The proposal appears to be a judicious one in many respects, inasmuch as it will tend to strengthen local associations by increasing their membership, while at the same time they will constitute the natural and proper sources from which the parent society may look for a steady accession of strength to its membership and funds. By thus infusing a popular spirit into the Highland Society, the directors not merely widen the basis upon which to carry on their operations, but they also increase the probabilities of making these operations more immediately felt and more permanently useful. The first obvious effect, as already observed, will be to strengthen the local societies—many of which there is reason to fear are in a languishing condition—and afterwards to link them together in the common duty of supporting the parent society. The circle of action will thus be complete, and a system set agoing which to appearance possesses all the elements necessary to stability and progressive expansion.

The next point to be considered is the question—Will the tenant-farmers of Scotland generally respond to the liberal and accommodating spirit displayed by the directors of the Highland Society, supposing their recommendation to be adopted? Our remarks in a former article on this subject, as well as at present, assume that they will do so readily, and that they only wait a reasonable adjustment of the terms of admission in order to come forward *en masse* to give the Highland Society what it has hitherto lacked—the hearty support and co-operation of the tenantry of Scotland. The directors have testified their respect for, and anxiety to meet the wishes of, the farmers, by resuming the annual exhibitions of stock and implements; and this resolution has been adopted, we are inclined to believe, with considerable monetary difficulties staring them in the face. If, therefore, the farmers are in earnest in their approval of these annual exhibitions, let them show it by a course of action equal to the exigencies of the case. The directors have done *their* duty, let the farmers do theirs also. What we advise is, for every farmer in Scotland, who can afford it, to make himself a life-member of the Highland and Agricultural Society, by a *single* payment of five guineas, as soon as the recommendation of the directors has been agreed to. The sum thus placed at the disposal of the directors would form a large and permanent fund, the interest upon which would enable them more thoroughly to systematise the operations of the Society, and advance the practical interests of agriculture.

The farmers of Scotland have it completely within their power to help forward their own interests by responding to the proposed recommendation of the directors of the Highland Society. Hitherto the help has come too much from the other side, and probably there has been too much coaxing required to draw out the support of the tenant-farmers in behalf of the parent societies. That there are many noble exceptions among them—many farmers who are not only members but have been directors of these societies—only makes the rule more obligatory on the defaulters. The difficulty of moving the agricultural body generally in favour of any practical proposal, the advantages of which are not perhaps immediately realisable, is somewhat remarkable when contrasted with the spontaneous and almost instantaneous response accorded to by the manufacturing class to projects of competition and exhibition of a far more formidable character. We are aware that some farmers even go the length of affecting to under-rate the utility of agricultural societies, yet, strange enough, these individuals frequently disprove their own cavils by adopting the very improvements which but for these societies had probably never been made public. We are inclined to think that few such objectors are to be found in Scotland—otherwise it sadly belies its character for intelligence—and we would earnestly recommend the secretaries of the local agricultural societies of that country to use their influence in bringing the recommendation of the directors of the Highland and Agricultural Society under the favourable notice of their own members.

* High Farming Vindicated and Farther Illustrated. By James Caird, &c. Adam and Charles Black, Edinburgh; Longmans, London.

EGYPTIAN WHEAT.

As I have been applied to by some of the subscribers to the *Agricultural Gazette* to publish some additional information respecting the Wheat I have before referred to, with your permission I will endeavour to give the information required. I obtained it late in the year 1848, under the name of Mummy Wheat; but my opinion has always been that no Wheat taken from mummies retains vitality. I have, however, three specimens now by me of Mummy Wheat, and of the genuineness of two of them there can be no doubt, and I shall very soon put them all to the trial whether they will germinate or not; but if they should, or either of them, it will be to me an agreeable surprise. My own opinion has always been that farinaceous seeds will retain vitality but for a very few years under any circumstances whatever, but that oleaginous seeds, on the contrary, will retain life to, I believe, an almost indefinite length of time.

But although I have no faith that this Wheat was found in a mummy, yet there is no doubt but it originally was brought from Egypt, and that it is the same Wheat, and therefore to me most interesting, which is referred to in the 41st chapter of Genesis and 5th verse, in Pharaoh's account of his dream. I state that I have no doubt but such is the fact, because travellers, on whose veracity I can rely, have informed me that they have seen it grow there, and that it exactly answers the

description of it recorded by the Divine historian. But I will extract the account of it as given in a comment in the place I have here referred to in D'Oyly and Mant's Bible, and taken from "Fragments to Calmet."

"This is not," says the learned commentator, "an unusual and monstrous production, as it has often been supposed to be. A species of Wheat which grows in Egypt actually bears when perfect this number of ears on one stalk" (seven ears of corn came up upon one stalk, rank and good). "The stem is solid, or at least full of pith, in order to yield sufficient nourishment and support to so great a weight as the ears it bears, whereas the stem of our own Wheat is a mere hollow straw." *Fragments to Calmet.*

This is an exact description of this wonderful vegetable production, except that I grew last year many stalks with 10 ears on them, and, as I have so often repeated, many roots from single grains produced nearly 4000 fold.

My old opponent, Mr. Baker, turns my account of this Wheat into ridicule. He has published over and over again also that "it is a Wheat coarse and not fit for mealing purposes;" but I hope my friends will believe me when I state for their information, and I know I have many among the readers of the *Agri. Gazette*, that my firm belief is that it is the most valuable species of Wheat now in existence. The flour is the most nutritious of any I have ever before possessed, and the bread and pastry made from it have a flavour in them which, I believe, cannot be surpassed for excellence. With regard to its cultivation, I hope it will not for some years fall into the hands of men who, from long prejudice, cannot believe that corn can be grown unless they put 15 or 20, or even 30 grains of seed, and even more, in a space of ground on which in skilful hands one grain only will develop itself and arrive at perfection. But of this Wheat, 43,260 grains only are sufficient for an acre of land, and that quantity I grew last year from 11 or 12 seeds only, and is the 11th or 12th part of a bushel. I am aware, as the learned Calmet has written, that this will appear to be "a monstrous production!" I am aware also that my friend, Mr. Baker, will insinuate again that I write fables, but "truth is truth nevertheless;" and in a matter of so much importance to my country I shall not shrink from declaring it. But is there not something interesting in the certain knowledge that we possess the self-same species of Wheat which God himself showed to Pharoah in his vision, and which the venerable Jacob and his 12 sons, the Patriarchs, made bread of and eat in the land of Egypt, 3565 years since? For my part, though thoughtless bigotry and prejudice may again and again publish to the world that it is not fit for mealing purposes, I cannot express the pleasurable sensations which I daily and hourly felt last summer, as I saw it ripening in my field; and out of the field it was with pain that I kept myself, for I was in it, among the beautiful crop, the most beautiful I had ever before seen, almost every day, from morning till night nearly. Nor is it a slight pleasure I feel that I have at this moment bread on my table made from the Almighty Creator's favourite grain, and which is the same Wheat with which, 3565 years since, He in his wisdom and mercy sustained his human creatures from miserable destruction during the most lengthened and widely spread famine which has been permitted to exist since the beginning of time! I have stated, however, that I hope for some time it will not fall into the hands of prejudiced men, for I firmly believe that as much as two pecks of seed an acre would endanger the crop. Farmers in general, therefore, must not use it; but if any gentleman who has a well-cultivated open space of ground from which he can keep the birds at harvest, will cultivate it in the manner I have described, that is, put a single grain in every square foot of ground, and no more; or if he pleases, put a single grain into a foot and a half of ground, the result must be exactly as it was in my field, namely, he will have "seven ears of corn," or more "come up upon one stalk, rank and good," and in some instances from 3500 to 4000 fold. But the land must be free from underground stagnant water, be well and deeply cultivated, and not merely turned over with a plough, and contain the proper food for Wheat to feed on. *Geo. Wilkins.* [The Egyptian Wheat (Triticum compositum) has been commonly cultivated in our neighbourhood—chiefly among allotment tenants, with whom quantity rather than quality is an object. It does not fetch the average price of Wheat in the market, owing to the inferior quality which millers, and therefore corn-factors, believe it to possess.]

PRICES OF WHEAT.

I PROCEED with the collection of Prices (commenced in your last Number), carrying it through the 17th century, into the early years of the 18th; when the great exporting period commenced, with an extraordinary succession of good Harvests. The last year named in the former Table was 1597; in which, according to Fleetwood, Wheat fell from 5*l.* 4*s.* to 4*l.* per quarter.

YEAR.	*s.*	*d.*	AUTHORITY.
1599—"The price of Wheat per quarter had fallen to"	27	0	Sir F. Eden
1594 to 1612 } Average price during this period	42	5½	Windsor Tables

The average price of the whole period, viz., from 1594 to 1713 (both inclusive), is a fraction under 48*s.* 5*d.* per quarter.

The above Table brings us nearly down to that time which may be called the GREAT EXPORTING PERIOD of British Agriculture; viz., the half century occurring between 1715 and 1765. It may make the whole subject more interesting, and of useful application, to trace briefly the rise and progress of our foreign Corn-trade, outwards and inwards, during the Five distinct phases or periods which it exhibits.

THE FIRST PERIOD

1534 to 1554 — Was one of opposition on the part of the Legislature to Exportation, altogether; and an (unavailing) attempt to suppress it by statute [25 Hen. VIII., c. 2]. This continued Twenty years; and indicates a prevalence of dear prices.

THE SECOND PERIOD

1554 to 1688 — Is marked by a qualified permission to export so long as the home price was below certain limits, which are fixed higher and higher by successive statutes, becoming more favourable to the export trade; but imposing a duty to be paid by the home-grower on the corn exported.

THE THIRD PERIOD.

1689 to 1715 — Opens with free permission to export, under the encouragement of a Bounty (5*s.* per quarter), followed in 1700 by an abolition of the Export-duty (2*s.* per quarter), which from 1688 had survived, (*side by side with the Bounty!*) Both were, however, inoperative for about six and twenty years after the passing of the Act [1 Wm. and M. c. 12.] owing to the dearness which prevailed during that period. (*The Barren Years.*)

THE FOURTH PERIOD.

1716 to 1765 — Comprises half a Century of great Plenty; during which Exportation was at its height: small Importations also occurring occasionally. In these fifty years there were only five deficient harvests. The balance of Exports was 31 million of quarters; on which the sum paid in Bounties was upwards of six millions sterling.

THE FIFTH PERIOD

1765 to 1791 — Commenced with a Cycle of Ten bad Harvests. Frequent suspensions of the privilege of Exporting, and of the Bounty; which at last becomes a dead letter. The tide having turned, *Im*portation becomes constant and considerable. A duty of sixpence per quarter is placed in 1773 on imported corn [13th Geo. III., c. 43]. The Importations during the period amount to upwards of five millions of quarters. The average home-price (1765 to 1791, both inclusive), was 47*s.* 2½*d.* per quarter.

This last period is the most instructive of any that can be referred to: as Import and Export were equally free. From its close in 1791 down to 1815, all calcu-

lation or experience is frustrated by the outbreak and continuance of the European war, aggravated by alternating seasons of severe scarcity; followed, in 1815, by legislative efforts to palliate the continued effect of a sudden collapse of prices on the return to a state of Peace. Immense, and indeed unprecedented, as the progress has been from that date in Trade, Commerce, and the Useful Arts, Agriculture included, it can only be regarded, historically, as one of continued struggle, on the part of the Agriculturist, against the irregular but sure declension of prices towards their natural level: which, so far as a judgment may be hazarded from both the averages above drawn, the first from a very long, and the second from a significantly apposite and instructive period—would seem to point to 47*s.* or 48*s.* per quarter: the improvements in Agriculture, and the increase of population, being taken as a counterpoise to each other. *C. Wren Hoskyns.*

FEEDING ON OPEN BOARDED FLOORS.

Having some north country enquiries as to this system, I proceed to detail my own practice. In order to arrive at the proper width of opening between each plank, I measured the animals' feet, and found them when closed, as follows:—Sheep, 2 inches wide; pigs, 1⅝ to 2½ inches; cattle, 3½ to 4½ inches.

I therefore made the openings 1¼ inch for sheep, pigs, and small calves, 2½ inch for bullocks. The three former answer admirably; the latter no doubt, will likewise do, although I have not quite completed the bullock floors. The Rev. Mr. Huxtable, who originated the plan, has much smaller openings; but I found practically an immense advantage by enlarging them. The sheep sweep their own floor quite clean—of course they have no straw. Pigs do admirably well, but we give them straw at the ends or corners for bed. Pigs having no wool and very little hair, must have warmth in cold weather, or they will get internal inflammation from want of external circulation. I think I save three-fourths of the straw by boards for pigs, and no doubt shall do so with bullocks. I find that a great deal of the solid manure also goes through the openings, when trodden upon by the pigs, and of course by the bullocks also.

I am satisfied the openings might be even larger; for I have seen very young pigs gallop across the sheep floor when disturbed trespassing for the odd pieces. Still I like to be on the safe side; I have never had an accident yet.

Straight sound yellow Deals answer best. They require no planing, merely sawing. I use 1½ inch thickness for sheep and hogs; 2 inch for bullocks. Width for sheep, 2¾ inches; width for bullocks, 2¾ in. The bearers may be of Oak, or yellow Deal, or 4½ brick partitions. The planks are divided by a wooden gauge, and nailed to the cross ledges, the nails well clenched on the under side. Ledges 2 feet apart, bearers 4 feet apart, convenient sizes for removal and lifting up, 8 or 9 feet, by 6 or 7 feet.

One hundred Hampshire down sheep at this time of year, having long wool, require a superficial area of 1000 feet, which gives also room for their food and water troughs. (Sheep should always have access to water, and also to a lump of salt). Each sheep has thus an allowance of 10 superficial feet for itself, and its feeding apparatus. I emptied one shed tank to-day, 2 feet deep, it was three parts filled with burned clay or brickdust—there was no spare liquid. I put on 9 loads per imperial acre; of course it was saturated and mixed with the urine and droppings, no straw. The pigs are over my liquid manure tank. The almost constant stream when the pigs are moving about, reminds the ear, and the hearer, how much straw it would require to absorb the trickling deposit.

Large breeds of long woolled sheep, such as Cotswolds, Kents, &c., would require a larger area. After sheep are shorn they may be packed much closer. You will find sheep thus shedded require shearing earlier than if in the open air. One very warm day, early in May, I wondered why the sheep could not feed, but soon found they wanted their jackets off. I never had a sheep ill on boards, although about three fat ones were slaughtered when giddy. I consider the boards a certain cure for foot-rot. We generally find many lame sheep after their long journey, as they come from the Hampshire flock-masters. In about three weeks the worst of them are "all right," being of course properly attended to on arrival.

The Rev. Mr. Huxtable tells me, his trellis work, or openings for bullocks, are only ¾ inch or less. Mine will be 2½ inches for bullocks; I attach much importance to ample space, provided the animal's feet *cannot* enter the opening.

For bullocks, the planks should be laid parallel with the manger; also for sheep, although not so material. No fermenting material should be used under the sheep or animals, or it will injure their health. Burned ashes, dark friable soil, sawdust, or dry sand, are all good.

Every day we sprinkle half a bushel of gypsum to each 100 sheep, on the boards. Their urine falls on it, and it is worked through, and the ammonia is preserved. I pay 15*s.* per ton for my gypsum. I also sprinkle salt on now and then pretty freely, and sweep it through, otherwise it makes the boards wet. I am satisfied, after two years' trial, that we shall *all* be board feeders by-and-bye. I used to fold my sheep out in the day, and on boards at night, but experience has shown me what an enormous advantage there is in keeping them always warm, dry, and comfortable, instead of making them "steam engines" in wet weather. We were a good deal plagued at first when we had narrow ¾in. openings, having to sweep the floor, and the sheep got dirty, but now with 1¼ in. openings, there is no trouble in any way; no expence of littering. The cost of boarding and labour, per superficial yard of 9 feet, is, as near as I can calculate—for the sheep floor, 4*s.* 2*d.* to 4*s.* 6*d.*; for the bullock do, about the same. Bricked and cemented tank under it, about 2*s.* per superficial yard. The urine and manure appear to preserve and harden the flooring. So great is the comfort and saving of straw that I shall extend the operation materially, and report progress when my bullocks are boarded. I shall give the bullocks a little straw, perhaps, according to circumstances. *J. J. Mechi, Tiptree-hall, Kelvedon, Essex, Feb.* 12. P. S. I fear, as some of our old practical friends find so much difficulty in getting their straw "stamped down," that they will wonder what we want boarded floors for. By-the-bye, I saw, at Earl Bathurst's farm, at Cirencester, a great number of sheep on boards tied up like bullocks, and doing well.

Home Correspondence.

Practice with Science.—The discoveries of the age have been displayed in the composition and application of manures. One of the most important parts of husbandry is to return, through the medium of manures, the richness extracted from the land by cropping. Every farm situated at a distance from a town should raise sufficient manure to supply its own requirements. This is what is commonly called a self-supporting farm. A farm of this kind should have every possible convenience in the construction of the buildings belonging to it. The usual form of these is an oblong quadrangle. If the manure is to be raised through the cultivation of green crops, the feeding of stock becomes a necessary consequence. There is perhaps nothing in which so much deception is common as in the feeding of animals of different kinds; the exact cost of the keep not being accurately reckoned, the clear profit is generally considered greater than it really is. Those who have brought their calculations to a strict reckoning, have generally found that they have made no pecuniary gain, but more frequently have experienced a serious loss; yet, notwithstanding this, they have found it necessary to continue the system for the purpose of turning their straw into good manure. Mr. Hillyard, in his work on "Practical Farming and Grazing," has given this matter much consideration. From the calculations there given, it does not appear that a bullock can be kept much under 10*s.* a week, attendance included, and oilcake being 10*l.* a ton. If a bullock be put on Turnips and oilcake for 16 weeks, there would be an expense incurred of 8*l.* If a 3-year-old beast be bought at 12*l.*, and sold at 20*l.*, which is as much or more than can be expected at the present low price of meat, there would remain nothing—but the manure a free gain. Thus the feeding of bullocks can only be considered, as has been justly observed, an improved machine for converting straw into dung; the next question is, how is this machine to act most efficiently? There are three modes in use—feeding in boxes, in stalls, and in open courts with sheds. Much discussion has lately arisen on Mr. Warnes' method of box feeding. It is alleged that not only will the animal feed faster and better in this way, but the dung is also better made. The straw retains the whole strength of the urine, and by the constant compression going forward, none of the ammonia can escape. All animals like warmth, and as Nature generally points out that which is good for them, so is it clear that the same warmth is essential for their health and well-doing. Animals fastened up by the head, frequently great numbers in a long range, will have the means of obtaining this warmth more perhaps than in any other way, and often to too great a degree; but it may be a question whether health will be promoted by this close confinement, and without that they are not likely to increase in flesh and substance, as they ought to do. In sheds with open courts, not more than four or five beasts in each, they have room to move about, which is conducive to health and therefore fatness; they have sufficient warmth, in case the opening in the shed is not larger than is necessary for their safety to pass to and fro, and I believe it is a matter beyond all doubt that they will make infinitely the largest quantity of dung, particularly so, if a few pigs are placed along with them. Whatever be the arrangement of the farm buildings, the fall of the ground should dip to the centre of the yard, the whole contents of the liquid manure being conveyed into a tank at the lower end. Dung should be neither too wet nor too dry, but with sufficient moisture to cause a certain degree of fermentation, and thus assist in its decomposition. The different roofs of the building should be spouted to carry off the water to a distance, and to prevent its starving and drowning the main dung heap. Mr. Spooner, in the Royal Agricultural Society's Journal, gives a good idea of his mode of preserving his dung in a proper state. The part where this is put is sunk some feet deep, sloping downwards; a wall is built on each side, with proper openings, through which the dung is thrown from the different sheds, and with a roof at the top to keep out the rain. The dung is thus kept free from any injurious wet, and if it gets too dry it is moistened from the tank at the lower part. When it has to be removed the cart is backed under the shed. By the manure being thus preserved and made the most of, there is not only sufficient for what is wanted for the farm, but some to spare, which is sold. No farm-yard should ever be without a tank on the inside, and a reservoir communicating with it on the outside. This may be made at little expense, and will often pay for its cost in a single year. Independent of the great value of liquid manure, when used by itself for different farming purposes, it is most valuable for the purpose just described, giving moisture to the dung heap, when required, to promote fermentation. The dung in the farm-yard should not be turned, as, if this were done too frequently, its strength would be reduced, and it might at last be brought to what is called a *caput mortuum.* In the winter time advantage should be taken of a frost, and it should then be carted out, and put upon a headland for whatever crop it may be wanted in the spring, whether it be Beans, Turnips, &c. This should be raised into a large high heap, as the less surface it covers the less likely is the ammonia to escape. It is a common practice to cart and unload upon the heap. This, however, is by some objected to, as the unequal pressure from the wheels and the horses' hoofs will create lumps in the dung, which will cause its unequal distribution, when it comes to be spread in the drills. Over the top of the heap should be placed a layer of gypsum, to prevent the escape of ammonia, or if that cannot be easily obtained, a covering some inches thick of common soil well trodden down. To this may be added the high authority of Sir Humphrey Davy, who, in his "Agricultural Chemistry" (p. 6), says that "whoever refers to the simplest principles of chemistry cannot entertain a doubt whether manure ought to be ploughed into the land recent, or when it has gone through the process of fermentation. As soon as the dung begins to decompose it throws off its volatile parts, which are the most valuable and the most efficient. Dung which has fermented, so as to become a mere soft cohesive mass, has generally lost from one-third to one-half of its most useful constituent elements; and, that it may exert its full action on the plant, and lose none of its nutritive powers, it should evidently be applied much sooner, and long before decomposition has arrived at its ultimate results." *Law. Rawstorne.*

Pheasant and Domestic Fowl.—As I have been trying, year after year, to procure hybrids between the pheasant and domestic fowl without any success, I think it right to say that, in my opinion, it is all but a fruitless endeavour to try to obtain them. Although some few specimens have been produced between them, yet it is of such rare occurrence (even where every care and perseverance has been bestowed upon them), that I think the trouble and expense outweighs the chances of success. If your correspondent, "L. V. R.," has ever seen hybrids from these two species, I think he will at once conclude, with me, that they are very clumsy ill-looking birds, with the beauties of both parents so obscured by the union that they have nothing left but their singularity to recommend them, which circumstance is a sufficient proof that they do not (as some people would have us believe) regularly breed with the poultry of farms adjacent to preserves. I cannot believe that a single instance of the kind, upon good authority, can be produced. The only chance of breeding them is in confinement, and then but very rarely indeed can it be accomplished. Out of more than 100 eggs last year, from a bantam hen confined with a cock pheasant, I had only two prolific ones (the chicks of which were too weak to extricate themselves from the eggs), the rest were clear or unprolific, and if any one had reason to expect progeny, I certainly had; and I think such an infringement upon the fixed laws of Nature will never be attended with much success. *J. B. B.*

Advertisements.—The abolition of the advertisement duty would confer much advantage on agriculture. The difficulty of intercommunication between farmers, renders them an easy prey to a multitude of jobbers, who, if they buy cheap, take especial care to sell as dear as they can find a customer to pay. I have often found, when too late, that I was wanting something which my neighbour a mile or two off was most anxious to dispose of. Were advertisements 2*s.* 6*d.*, instead of 5*s.* or 7*s.*, they would be almost constantly used. The abolition of the penny stamp duty on newspapers would do more to educate the people than all our educational acts of Parliament. When I say education, I mean the power of reading, which, in our country districts, if acquired at a Sunday or national school, is soon after, like a piece of unused iron, destroyed by the rust of non-employment. One of the main secrets of American success is their cheap twopenny newspapers. The insinuation of cheapness reaches the most minute veins as well as the larger arteries. *J. J. Mechi, Feb.* 2.

Mr. Charnock's Paper on Drainage.—As the best medium I can adopt, may I beg permission, through the columns of the *Gardeners' Chronicle and Agricultural Gazette*, to correct an error, which has inadvertently escaped revision, in my paper on "drainage," in the present number of the "Journal of the Royal Agricultural Society of England." The error referred to is that wherein the amount of filtration, as shown from the Holmfield House experiments, is stated to be $5\frac{1}{10}$ per cent of the rain that has fallen, whereas it should be 18⅓ per cent., as every reader of the paper will perceive, by the respective quantities given of filtration and rain. It will be seen that this mistake does not affect the argument in any material degree; nevertheless I wish its correction to come from myself. *J. H. Charnock.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House, in Hanover-square, on the 13th inst.: Present—Mr.

Slaney, M.P., in the chair, Hon. Captain Dudley Pelham, R. N., M. P., Baron Mertens, Mr. Alcock, M.P., Mr. Burke, Mr. Dyer, Mr. Fuller, M.P., Mr. H. F. Hunt, Mr. Majendie, Mr. Pendarves, M.P., Professor Sewell, and Mr. Reynolds Solly.

The Marquis of Westminster was elected a Governor of the Society.

The following new members were elected :

Staniland, Meaburn, Mayor of Boston
Rome, Joseph, Mayor of Carlisle
Branwell, Christopher, Headon House, Sunderland
Colthurst, Joseph, 36, Jermyn-street, London
Milner, John, Hordle Farm, Lymington, Hants
Bayley, Robert Riddell, 4, Basinghall-street, London
Percival, Stanley, Bridgefoot, Barnet, Herts
Wyatt, Thomas, 359, Strand, London
Bradshaw, William, Slade House, Levenshume, Manchester
Caldwell, Capt. Fr. Ed. (78th Highlanders), Langford-lodge, Brandon, Norfolk
Treby, Paul Ourry, Goodamoor, Plympton, Devon
Steward, Charles, Henley, Ipswich, Suffolk
Stephens, Edward, Trewornan, Wadebridge, Cornwall
Samuelson, B., Britannia Iron Works, Banbury, Oxon
Wilkinson, Rev. John, Broughton Gifford, Melksham, Wilts
Dickin, Thos., jun., St. Stephen's-hill, Rugely, Staffordshire
Carew, Thomas, Colepriest House, Tiverton, Devon
Cail, J., 8, Pavilion-place, Battersea Fields, Surrey
Daniel, Thomas Daniel, Stuckeridge, Bampton, Devon
Maw, George, Southcott, Wesleigh, Bideford, Devon
Robinson, Mrs., Wilson House, Milnthorpe, Westmoreland
Veitch, James, Exeter, Devon
Riley, Edmond, South Dalton Grange, Beverley, Yorkshire
Stratton, Richard, Salthrop, Swindon, Wiltshire
Veitch, James, Jun., Exeter, Devonshire
Phillips, John R. Spencer, Riffams Lodge, Chelmsford, Essex
Roberts, William, 197, High-street, Exeter, Devonshire
Hayne, J., 24, Gloucester-square, Hyde-park, London
Lewis, Capt. T. E. Lock, R. E., Exeter, Devonshire
Packhard, E., Saxmundham, Suffolk
Arnold, William, Jun., Nethercott, Iddesleigh, Hatherleigh, Devonshire
Lubley, John, the Parsonage, Wiveliscombe, Somersetshire
Hellyer, G. W. Maine, Bashley, Lymington, Hampshire
Tatton, Thomas, Wittenshawe Hall, Northenden, Manchester
Reed, Howard, Long Sutton, Lincolnshire
Comins, Rev. William, Rackenford, Tiverton, Devonshire
Henry, James, Blackdown House, Petworth, Sussex
Harrison, James, Buckingham
Bentley, Robert John, Eastwood House, Rotherham, Yorkshire
Wills, Thomas, Jun., Eastury, Bovey-Tracey, Chudleigh, Devon
Smith, Sir Charles Cunliffe, Bart., Suttons, Romford, Essex
Arnold, Thomas Owen, the Park, Hatherleigh, Devonshire
Hoare, Richard, Hampstead, Middlesex
Galpine, W. L., Lymington, Hampshire
Thompson, Robert, 22, Victoria-road, Kensington, Middlesex
Mac Connell, Frederick, Newby Bridge, Milnthorpe, Westmlad.
Christy, James, Jun., Boyton Hall, Chelmsford, Essex
Edge, James Thomas, Stelly Hall, Nottinghamshire

Adulteration of Guano.—Mr. H. T. Hunt, of High-street, Lambeth, attended the Council for the purpose of reporting the extensive and systematic plans carried out weekly in the neighbourhood of the Metropolis, for the adulteration of Peruvian Guano, and which he thought it of the highest importance to be made known at this season of the year, when purchases of Guano were so largely made by farmers throughout the country. Mr. Hunt laid before the Council samples of the various compounds, manufactured for the express purpose of adulteration. The Council thanked Mr. Hunt for the favour of these communications, which they decided to refer to the next monthly Council, with a recommendation that a Special Committee should be appointed to investigate this important subject, and to place the samples of adulteration in the hands of the Consulting Chemist of the Society.

Canary Grass.—Mr. Majendie presented to the Council, on the part of Dr. Cazin, Secretary to the Agricultural Society at Boulogne, a specimen of the Phalaris arundinacea of Linnæus (known in this country as the Reed Canary-grass, or Riband-grass), along with a supply of the seeds for distribution among the members present.

Tuberous Roots.—Dr. Lindley transmitted from the Horticultural Society's Gardens at Chiswick, a supply of the tubers of Melloca for distribution and trial as an agricultural plant. In the last number of the Journal of the Horticultural Society, Dr. Lindley has given "Some Memoranda concerning the Melloca."

Australian Flax.—Mr. James Dixon, of Skelton Castle, Launceston, Van Diemen's Land, transmitted specimens of Flax grown by him in that colony during the three previous years.

Culture of Fruit Trees.—Mr. Robertson transmitted from Paris his mode of improving the culture of fruit trees, which the Council referred to the Journal Committee.

Wheat Sowing.—Mr. Birch Wolfe favoured the Council with a continuation of his experiments on the sowing of Wheat, which was also referred to the Journal Committee.

Miscellaneous Communications.—Baron Mertens presented a copy of his work entitled "Faits et observations sur l'utilité du Drainage perfectionné." Mr. Bullen (Secretary to the Royal Agricultural Improvement Society of Ireland) also personally presented a copy of the volume of the "Quarterly Journal of Agriculture and Industry of Ireland" for 1849. Mr. Fuller, M.P., presented a plan of his portable saw-mill, with a statement of its advantages. Mr. Willacy a plan and statement of his portable hand railway for farms. Mr. C. Steward a communication of his experience in the use of Crosskill's one-horse carts. Captain Waterton a statement of the value of his Alkaline Feeding Powder, given to cattle attacked by the prevailing epidemic; and Messrs. Dodd and Peeling a copy of their Farm Account-book.

The best thanks of the Council were ordered for these various presents and communications. It was announced that a Lecture, by Prof. Way, would be delivered to the Members on Wednesday, the 27th inst., at 12 o'clock.

Highland and Agricultural, *Jan.* 16.—His Grace the Duke of Buccleuch in the chair. *"The Advantages or Disadvantages of Subsoil Ploughing and of Trench Ploughing."*—Mr. Dickson said :

The effect of subsoil ploughing is, in process of time, to deepen the surface soil. It breaks up and loosens the subsoil, mixing it partially with the soil, greatly increasing the efficiency of the drainage, and by the admission of atmospheric influence to a much greater depth than formerly, renders what was previously a barren subsoil, and an obstruction to the effectual drainage of the soil, suitable for the reception of the roots of plants, thereby increasing their fertility, more particularly in seasons of either excessive drought or moisture. Besides these advantages, there is also the greatly increased facility, and saving of labour in the subsequent working of the land, and the ease with which, at any later period, the soil can be deepened by trench-ploughing, and bringing up a portion of the loosened and prepared subsoil. As to the disadvantages; the chief objection which I hear urged against subsoil ploughing is, the expense of the operation; this, I am glad to say, has now been materially diminished, or rather reduced to one-half of what it cost with the ploughs formerly in use, by the introduction and use of Reid's subsoil plough, as improved by Mr. Slight. I have seen wet undrained land, where the operation of subsoil ploughing was positively injurious; but this was an injudicious application, the effect produced, being to increase the depth of wet soil, and make it more difficult to work, and longer of drying; as it is now well understood that on wet land, draining should in all cases precede subsoil ploughing or trench ploughing. I have also seen a dry sandy loam with a gravelly and sandy subsoil, subsoil ploughed without any apparent beneficial result; this was obviously also an injudicious application, as the cause of the inferiority of this soil previously arose from the deficiency of alumina or clay, to enable it to retain sufficient moisture in dry weather, while the subsoil ploughing increased the porosity of the subsoil without adding to the soil, clay, or any other substance that could improve the quality of it. The plan I follow in subsoil ploughing, is to take a furrow with the common plough, from 9 to 10 inches deep, at right angles with the lines of the drain, the subsoil plough following and breaking up the subsoil 6 inches deeper, thus working in all to the depth of 15 or 16 inches; this I have been able to do with one pair of powerful horses in each plough; the cost of the operation (exclusive of the ordinary ploughing), is about 10*s.* per acre, and I find that I can save the whole of this extra labour in spring, when I come to work the land for green crops, as, from the depth to which the atmosphere has affected the land that has been subsoil ploughed, it is better in condition for drilling up for Turnips, after being grubbed and harrowed, to level and mix the soil, than is the land that had not been subsoil ploughed, after having got an additional ploughing, with harrowing and rolling. My experience in subsoil ploughing extends over the last 10 years, and, with the exception of the first experiment, which was made on a soil consisting of a deep dry loam, or a tolerably porous subsoil, where I observed no beneficial results, the whole of the other fields which I have subsoil ploughed have been much improved thereby; and, during the last three years, I have left a portion undone of each of the fields which I subsoil ploughed, that I might be better able to judge of the result of the operation. On all these fields I have observed that the portion not subsoil ploughed, was longer of drying in spring than that which was subsoil ploughed, and was about two days later of being in a fit state for working, and also that the crops of Beans, Potatoes, Turnips, and Wheat, were superior on the land which had been subsoil ploughed to those on the portions of the fields that had not been so treated. In November last I had much gratification in witnessing the very effectual deep working of the French plough and subsoil plough, on the Marquis of Tweeddale's home farm at Yester; and also of observing the successful result of the deep working of the soil in the preceding year, as shown in the immense crop of Turnips raised on inferior soil, with a very moderate application of manure. This confirmed my own experience of the beneficial result of deep working land that had previously been thoroughly drained I am of opinion that subsoil ploughing is an operation which may be profitably repeated on the same land periodically, previous to the application of manure, by each time going 2 inches deeper, and bringing up 2 inches of the previously loosened subsoil, and the subsoil plough also penetrating 2 inches deeper than formerly. I am not prepared to say how often this may be repeated with profit; but this I know, that it would be a very great advantage to, and would materially increase the produce of the land I farm, had I the whole of it cultivated to the depth of 18 inches. In conclusion, it appears to me that the question of the advantages or disadvantages of subsoil and trench ploughing, resolve into the comparative advantage or disadvantage of a deep or of a shallow soil; and seeing that it is well known that the roots of many of our cultivated plants—more particularly Turnips, Wheat, and red Clover—will go down in search of food to the depth of 3 feet, where the soil and subsoil are made fit for their reception, it can scarcely be said to remain an open question whether or not it is advisable so to deepen the soil at such a moderate outlay as I have here shown it to cost.—Mr. Hope, Fentonbarns, said: I feel a great degree of reluctance to do or say anything which has a tendency to throw doubt on what any practical man may deem an improvement in the practice of agriculture. Still it does not suit at all times to keep silence, and particularly on the present occasion, when I believe a frank expression of our united observations and experience may have the effect, if not to put money in our pockets, at least to keep what little there is there. I do not mean, in every case, to deny the utility of subsoiling and of trench or extra deep ploughing; but I do say that on arable land that has been long under the plough, and in fair condition, that they are operations requiring to be performed with great caution. If the soil has actually to be made, I grant at once their beneficial tendency; in fact, I do not think you can get well on without either one or both being efficiently attended to. But it is a very different matter if you take an ordinary Lothian farm, thoroughly drained, and say you must now subsoil plough it, and afterwards turn it over 18 or 20 inches deep. In the first place this will be a heavy expense, and in the second, I believe it will serve no good purpose. I am aware that, in 1843, Mr. Brodie, Abbeymains, obtained a premium from the East Lothian Agricultural Society for a report of an experiment in subsoiling, from which it appeared that, at the end of the fifth year, there was a profit of 1*l.* 10*s.* 1*d.* per acre, after deducting the original cost of the operation. Mr. Brodie is well known as one of the first practical farmers in Scotland, and who is not to be frightened at trouble or expense, if he sees any prospect of being repaid; but now Mr. Brodie has dropped the practice, and he perceives no difference in his crops. I could mention one or two other gentlemen who have tried it without benefit, though one thought the loss on his first Wheat crop more than compensated by the superiority of the Oats; but since then he has observed no difference. We all know that Oats require more moisture than any of the other cereals. I have tried subsoil ploughing in three different fields. On the first two it was unfortunately done up and down the ridge, or in the direction of the drains, being unaware at the time that it was considered necessary to have it done across the drains; so I will not insist on the loss sustained on the Wheat crop as telling against subsoiling; but a year or two afterwards, when tried on the third field of thin moorish soil, with a subsoil of rather hard yellow sand, and where I thought it would have a good effect, if anywhere, it was done across the drains. It is now upwards of eight years since then, but I have never been able to perceive the slightest difference on the crop where it was done, from where it was not done. A cleverly-written and ingeniously-reasoned pamphlet, styled "A Practical Essay on Deep Ploughing, by an East Lothian Agriculturist," was published two years ago. I believe it is no secret that the author resides near Dunbar, which, if not the land of Goshen, is very near it. The only experiment mentioned directly bearing on the point is in these words: "That land of the same quality ploughed 18 inches deep produced one-fifth more than that ploughed only 12 inches deep. Both these rates are beyond the common depth of field culture, and on the least of them there was an excellent crop in a very unfruitful season. The result strongly shows the utility of deep ploughing." It would have been more satisfactory if we had got over and above this meagre account a description of the soil, its previous management, and the kind of crop, of which there was one-fifth more. What might do on the well-known Dunbar glebe, might be very unsuitable on Fenton Muir. I recollect, two years ago, of trenching being in vogue, and some of the best fields in the county did not recover the effects of the operation for at least one rotation. I have sometimes lifted soils from headlands, and have had no crops on the bared space until it was thoroughly saturated with manure. But two years ago, I lifted fully 12 inches of one, composed of strong alluvial clay, and found below that, such a quantity of lime, that when again turned up by the plough, it had all the appearance of a rich compound. It ploughed much easier than the top soil that had been carted off, and the succeeding crop of Barley, without manure, was as strong as could grow. But there are not 2 acres of this description of soil on my farm. If I had ploughed this piece of land 20 inches or 2 feet deep, I would have had an excellent crop, and had I allowed myself to be carried away by one experiment, and gone over my whole farm as recommended by the East Lothian Agriculturist, I think the chances are at least equal that my name would before this have found its way to the "Gazette." I find it difficult enough to keep 6 or 8 inches on the surface, so full of manure as I could wish; I confess I am unable to stand the expense of doubling this depth, let alone quadrupling it. No doubt it might be a very nice thing to have a farm with a depth of 2 feet of rich soil; however I would prefer entering on such a possession to having the honour of making it. We have been told by a high authority in agricultural matters, that Swedish Turnips may be grown on a deal table, if certain chemical ingredients were properly served up to them. Without going this length, I may tell you I have eaten Peas grown in the neck of a glass bottle filled with common water, the original Pea having only a very small quantity of cotton wrapped round it to keep it moist. I look upon the soil simply as the store house in which is laid up, to be given forth when required, the necessary food for the growing crop, and the medium by which plants are enabled to take their food. The soil itself may or may not be naturally composed of the required ingredients, but whether these may have been placed there naturally or artificially, the generality of soils in this country may be viewed merely as the mechanical means by which the food of plants is conveyed to them. Constant cropping soon renders requisite to the richest and poorest, or removal or addition by the hand of man, of the materials that form the crops previously, and to be extracted from it. I have frequently heard of roots of various plants penetrating to great depth in search of nourishment, but I am inclined to believe that this only happens when the necessary food is wanting near the surface, and it may happen that the crop may be lost, or its growth so materially retarded, before the roots reach the substance on which it feeds, that the proper season of growth may have passed away. I once borrowed a machine from Mr. Ainslie, of Elvingston, for dibbling bones immediately below the Turnip seed. I tried it with guano and bones mixed, and though from the quantity of guano it did not work so pleasantly as I would have liked, yet the crop of Swedish Turnips grown after it was decidedly better than where the same quantity of manure was sown in the drills. I could only account for this by the whole manure being placed in such close proximity to the seed, that the roots seized upon it at once, and by that means the plants got a start which they kept to the end. I generally plough deeper for the Turnip crop than any other time during the rotation, principally because I think that deep ploughing assists in retaining the moisture longer, and consequently that the Turnips are not so apt to be hurt by drought; but the drills in which guano is sown (and Turnips now-a-days positively will not grow without it), are made quite ebb, so that the roots may get as quickly to it as possible. It is unquestionable that the richest part of all arable soils is usually on the surface, and that the cream is on the top. I see only harm in burying this out of the reach of plants. For all practical purposes, I find a plough furrow of 7 or 8 inches deep all that is required. For white crops, after either Beans, Potatoes, or Turnips, I think 6 or 8 inches quite enough. I once saw an experiment after Potatoes, where the field, having had Finlayson's harrow run through it, two ridges were not ploughed at all, and on them the Wheat crop was decidedly the thickest and best. A great deal depends on the mechanical texture of the soil, and what is suitable for one kind of crop and land does not answer for others. But I have ever found that it is a safe rule, on every description of soil, to make the land dry, keep it clean, to take care always to plough it at the proper time; obtain the finest possible tilth for all descriptions of green crops; turn over a neat clean furrow for grain crops; but above and beyond all, never to forget manure, for muck is emphatically the mother of money.—Mr. Robb, Gorgie, said: About 13 or 14 years ago I subsoil ploughed about 10 acres of the farm on which I reside. Two years after that I subsoiled some more of the same farm. About eight years ago I subsoiled some fields in Dumbartonshire, and this season I have subsoiled 12 acres of the farm I reside on, and intend doing more this season. The first-mentioned fields were ploughed with one of the earliest made subsoil ploughs from the neighbourhood of Stirling. The fields in Dumbartonshire were done by a plough improved by the late Mr. Stirling of Glenbervie. The operation this season was performed with a plough invented by Mr Slight, I believe. The two first-mentioned ploughs are powerful, they were worked by two men and four horses, and they were very difficult to guide; hence the work was rather irregularly done, notwithstanding strict attention was bestowed on it. I am inclined to think that very few fields have been thoroughly and uniformly subsoiled by such ploughs, sometimes they worked too deep, sometimes too shallow, sometimes too broad, sometimes too narrow, so that subsoils in many cases have been scooped out into a series of irregular hollows. During winter the hollow places were saturated with, and soured by, the stagnant water. I have no hesitation in saying that a worse crop might be produced, over these hollows, the first year after such subsoiling, than would have been produced on the same soil if the field had not been so subsoiled. The imperfect manner of performing the operation I believe to be the chief cause of disappointment. Subsoiling with the first-named ploughs was expensive, and in many cases, though not in all, unsatisfactory—six horses and three men being necessary, a little commotion took place in the establishment when one subsoiled. Now with Mr. Slight's plough, two men with four horses go a subsoiling as quickly and coolly as they go to ordinary ploughing. The common plough with two horses making a furrow about 10 inches broad, and as deep as they can, not being over nice about the proportions, the subsoil plough following, drawn by two horses, and stirring the subsoil from 3 to 5 inches deeper, without raising it, a boy follows throwing out the loose stones, and marking with pins any stones that require fork and spade to remove them. It is essential that the first plough cuts a furrow no broader than the subsoil plough can stir thoroughly and truly, as, upon this thorough and uniform stirring depends the success of the operation. I am afraid many persons may expect too much benefit to be

apparent on the first crop, after subsoiling. When the operation is imperfectly performed, little or no benefit can accrue. Even when the work is done in the very best manner, according to our present means, I would not look for a very marked increase of crop, the first year after the operation. When we thoroughly stir our subsoils, we do not make them fit to produce superior crops immediately; we only put them in a condition which facilitates the changes necessary to make them more subservient in assisting the soil to produce superior crops. We merely put them in a condition to acquire influence and power. If my views are correct (and my experience induces me to believe they are), we can, by judicious thorough subsoil ploughing, convert a clay soil into a loam; we can acquire a deeper soil, that shall absorb a greater quantity of rain in a given time, without being injured by it that shall afford the roots of plants a larger field through which to ramify in search of food, and shall dry earlier and more uniformly in the spring, thereby admitting the plough earlier; that shall retain and give out by slow degrees a greater quantity of air and moisture, nourishing the crops for a longer period; that shall produce a crop more uniform as to bulk—a crop that shall ripen more equally, and be of more equal quality. These results I shall name "The advantages to be derived from judicious, thorough, uniform, subsoil ploughing."

—Mr. PATERSON, Meadowfield: Several years ago I tried some experiments in trench ploughing, but I never, in any instance, thought it paid for the additional expense incurred. One field upon which I experimented lay upon a considerable slope, the upper part of it was a dry gravelly soil, upon an open gravelly subsoil; the lower part of the field was gravel mixed with clay upon a close retentive subsoil; no part of it was furrow drained. The lower and wet part was partially cross drained. Upon the dry land I think the operations made no perceptible difference; the wet land evidently was injured by it. Since then, I have never either subsoiled or trench ploughed any. But the system having been advocated by men of high standing in the agricultural community, I have turned my thoughts a good deal to the subject, and although I would not say that in some soils and certain situations it might not prove beneficial, yet am of opinion its universal adoption would be a waste of money, and never would remunerate those who practised it indiscriminately on all kinds of soils. On wet and undrained soil its effects have been admitted by all to be injurious, and although on the same kind of lands when drained, its injurious effects have been less apparent, yet I think they may still have been so to a certain extent. One advantage said to be derived from the operation, is the facilitating the ingress of the water into the drains; my opinion is, that if land is thoroughly deep drained, nothing will prevent the water getting into the drains; and subsoiling clayey land, I believe, has the effect rather of retarding than accelerating the descent of the water into the drains, and upon open bottomed land the operation is not required for this purpose. In confirmation of this opinion, every person must have observed, when preparing his land for green crop in a wet spring, that if, while he ploughed shallow (which is generally done at first if the land is dirty), he was overtaken with a heavy fall of rain, the land soon dried and was little the worse, whereas, if immediately before a heavy rain, he had given it a very deep furrow, the consequences were far more injurious, and the land longer in drying, which shows that the deeper the soil is stirred, so much the longer will it be in drying, and on this account, I am of opinion, that trench ploughing and subsoiling has not the effect of facilitating the ingress of water into the drains. Another advantage said to be derived from subsoiling, is the loosening the soil to a greater extent, and thereby allowing the roots of plants to penetrate more easily into it in quest of food. This advantage, like the former, I think, is over-estimated; for in land in good heart, the roots of plants do not go very far down in quest of food; and I think the common two-horse plough efficiently used, goes quite deep enough for this purpose. I have often thought that if the advantages of subsoiling were as great as its supporters would make us believe, what immense crops would we not see upon the tops of our drains, where we have subsoiling in the most perfect manner; yet what do we here experience on a well drained field? I have never yet been able to see the smallest difference between that part immediately over the drains and the rest of the field. The only kinds of land upon which I think subsoiling to be of advantage are upon moorish land, where, under a thin covering of moss, or clay, there is a sort of muir-bound pan, which the common plough will not penetrate, and which it is necessary to break through, in order to get a sufficiency of loosened soil to produce a crop; and also on land that has been long under an imperfect cultivation, and become so very hard by continued shallow ploughing, that subsoiling is the only way in which it can be got ploughed to an ordinary depth. My practice is never to plough very deep except once during the rotation, and that either in the autumn ploughing, immediately before the green crop (if the land is clean), or, if not, after the land is properly cleaned, and before I put in my green crop in the spring, then I plough very narrow, and as deep as two horses can draw—say about 10 or 11 inches. This, I think, in most cases, is all that is necessary, in the way of stirring and turning over the soil, for keeping the land in the greatest state of fertility.—Mr. LAING, Addinstone, said: A portion of the most retentive land, consisting of 3 acres, was set apart for an experiment on this subject. One acre was drained 15 feet wide, another 30 feet, and the third portion was not drained at all; the first portion was not subsoil ploughed, the second and third portions were subsoiled. The results proved that subsoil ploughing with drains 30 feet apart, produced better crops than with drains 15 feet without that operation; while the undrained land was soured and did not recover its fertility till it was drained and subsoil ploughed. After entering in 1810 to the farm of Addinstone, in Berwickshire, the property of the Marquis of Tweeddale, I continued the use of the implement with success: but, from the land, which I then supposed only required that work, consisting of portions at the bottom of some of the fields, while the upper part is dry Turnip land on a gravel subsoil—in some seasons apt to suffer from drought, and lying on a considerable declivity, I was induced to subsoil the whole field. This would have been tedious work with the Deanston plough, from the extent to be gone over. Consequently, it suggested itself to me to convert the common plough into a subsoil one, which was easily accomplished, by taking off the mould-board, and putting on subsoil apparatus. By this means, the land being free from frost, stones have been ploughed from 14 to 16 inches deep, both through the clay and gravel subsoil, the effect from which has amply repaid the expense—the dry land producing Turnips of greater size, and the grain crops not being nearly so much affected with drought, while the wet land, at the bottom of the fields, having been previously thorough drained, was rendered comparatively dry, producing luxuriant crops. With regard to deep or trench-ploughing, I would consider that on land where the subsoil consists of retentive sterile clay, it would not be prudent to bring such under that operation, unless it had been subsoil ploughed at the beginning of the previous rotation; that the subsoil would be ameliorated, from the admission of air and water, and brought into a fit state for mixing with the active soil. I can add testimony to this so far, from having portions of my farm, consisting of dry loam, and the same description of land with clay and sand in the subsoil that required draining, which I have successfully turned over to the depth of 15 or 16 inches, with three horses yoked abreast with the equalising draught swing-trees. To those proprietors or farmers who still may have doubts regarding the efficacy of such operations, I would strongly recommend a visit to Broadwoodside, his lordship's experimental farm. There they will see land that was valued a few years ago at a rent of 7*s.* per acre, yielding abundant crops of corn and Turnip. These results have been produced by thorough draining, and ploughing to the depth of 14 inches; and now several of the fields have been operated on with these efficient implements, the Tweeddale and the subsoil-trench ploughs, lately invented by his lordship (the former turning, in the most substantial and satisfactory manner, a furrow 14 inches deep, and the latter stirring up and mixing the subsoil), making nearly a uniform soil to the depth of 20 inches.—Mr. M'LEAN, Braidwood, said: I believe, to do justice to subsoiling, the under soil should only be loosened or stirred up, so as to allow a more easy and immediate escape of the water into the drains or subsoil, and to give more easy access to the roots of plants. I think it will be generally admitted that 6 or 8 inches of the upper soil contains the soil and substance of fertility; this arises from the continued action of the atmosphere, the repeated tillage, the frequent manurings, the droppings from the cattle and sheep when under pasturage, and, withal, the constant working of the worms and other small animals, which a wise Providence has so wisely arranged to increase the fertility of the soil; so, in adding largely to the hitherto enriched soil, by a poor and likely unproductive subsoil, you deteriorate to a certain extent the value of the whole.—Mr. FINNIE, Swanston, said: I have both subsoiled and trench ploughed, but while I never could say that the same crops stated by the advocates of subsoiling were realised, from trench ploughing I have experienced decided benefit. In such a locality as this, and where the land is so much dosed with manure from the town, annual weeds are very troublesome. These I have found disappear to a very great extent by the trench ploughing. My Grass and after crops have likewise been very much improved; but it is a singular fact that, notwithstanding all that has been advanced in favour of subsoiling, not one accredited statement has ever reached my eye, showing the comparative advantages arising from it above a similar piece of ground, judiciously and substantially cultivated by the ordinary plough; and as I have no prejudice to subsoiling, my anxiety is to have the problem solved by actual and comprehensive results. — Mr. BERTRAM SMEATON: It so happened that part of his farm was to be subsoiled at one time, and he demurred to it, but the work was proceeded with. Eight additional horses were put on his farm, and he attended the operation with great pleasure. The work was beautifully done, and he watched, with great interest, the progress of the crops. He was certain that he visited the crops at least twenty times, but no shade of difference could he detect between the subsoiled and the unsubsoiled, the drained and the undrained. He carefully compared the two crops, and found no difference. All he could say in favour of the subsoiling was that it did no harm. It was his impression that the land would have been injured, but he could not say that it had that effect. The result of the operation, after all the additional strength employed, so far as he could perceive, was just exactly *nihil.* (Laughter.)—Mr. MELVIN, Bonnington, said: In reference to the remarks made by Mr. Dickson, that subsoil ploughing did not show at the first—it happened to be the reverse with me, for soon after Mr. Smith had published his description of his plough, I had an opportunity of seeing it at work, and certainly praise the way in which his six horses wrought the massive implement, and the effectual manner in which the subsoil was broken up. As it was but reasonable to expect good to result from its use, I resolved to attempt the operation, and procured a smaller plough, to which three horses were attached, but it was found that the horses had not sufficient power, and the work was done as described by Mr. Robb. A larger plough and four horses were then employed, and with this about 100 acres of land were gone over, a report of the results of part of which was submitted to the Society; but since then I have seen reason somewhat to modify my views, as, although on 40 acres for the first two or three years the cost of the operation was returned, yet afterwards the crops did not appear better, as was the case on the remaining portion, judging by the eye, as Mr. Dickson says he did. Remarks have been made regarding subsoil ploughing deepening soil, but we must recollect that the soil has required thousands of years for its formation, and forcing a piece of steel and iron through the subsoil will hardly at once convert it into soil. However the means now proposed to effect the thorough performance of the operation, seems hardly equal to the work; for to do the work effectually it took six horses in the Deanston plough; two are only required for the one now recommended; let us recollect for a moment that the surface soil requires the power of two horses in the common plough to work it to the depth of 7 or 8 inches, and it appears to me unreasonable to expect that the same two horses can plough to 8 inches deep the firm tenacious subsoil, which has remained undisturbed for ages.—The noble Chairman then observed that what he had that day heard both for and against the system of subsoiling, satisfied him that still there was a great deal to be done before coming to any really sound conclusion on the subject. He was perfectly satisfied that on some land of his own he has experienced much benefit from subsoiling. He was glad that he had heard the discussion that day, and he must say that he had heard nothing—not even from his friend Mr. Bertram—to shake his faith in the value of deep ploughing or subsoiling. Where draining was not an accompaniment of the subsoiling, he considered it to be no better than throwing away money.

Calendar of Operations.

FEBRUARY.

DORSET FARM, *Feb.* 11.—Since last report we have got out a good quantity of dung ready for the Mangold and Turnip crops; and also a part of the pastures dressed with pond mud, at the rate of 18 to 20 yards per acre. Some of our ploughs have been employed after the Turnips, to be sowed with spring Wheat, drilled in with some Rape dust and ashes. We have taken up and stored our Swedes, laying them down in lines about 6 feet wide, and as high as they will pile up, thatching them to keep out sun and rain. Our ewes, with the exception of some young ones, have mostly lambed, but we have not so many lambs as usual in proportion to the flock. We have not lost many, but have had very few twins. We are to fat off the old ewes with their lambs, and are giving them, in addition to their Grass, a quantity of Mangold Wurzel and a pound of Linseed cake per day, and the lambs are allowed to run before the fold and get some cake that they can take at any time. In feeding couples it is better not to let the mothers have too much cake, as I believe it has a tendency to dry up the milk, although it may fat the ewe quicker, and the Mangold Wurzel keeps up a flow of milk. We have now begun to give the land intended for Barley a second ploughing, but the weather is so wet that sowing cannot yet be hardly thought of, but as soon as it is dry enough we shall commence sowing Wheat and Barley. *G. S.*

SUSSEX FARM, *Feb.* 11.—The weather for two weeks past has been favourable for getting on with farming work; our teams for the most part have been engaged ploughing the remainder of the land intended for Oats, Peas, and Tares. The day being rather wet our teams are engaged carting home Swedes for the cattle, cows, and sheep, and Carrots for the horses, carting litter from plantations home to cattle yards, drawing poles out of woods for the Hop gardens; but, as soon as the land is dry enough, we shall commence to sow Beans, Peas, and Tares. Men are engaged threshing Beans, Peas, and Oats, for seed; sorting Hop-poles, digging Hops, &c. Our stock ewes receive daily two cart-loads of Swedes, and a feed of hay night and morning; the lambs receive one cart-load of yellow Turnips daily, and are shifted every day or two from field to field. *J. B.*

Notices to Correspondents.

ACIDITY IN BEER: *Cerevisium* says, "In your Paper there have appeared divers methods for correcting acidity in beer by means of alkalies; nothing can be more easy, and it is the plan generally resorted to when drank by most persons. But this, I take it, is not the difficulty to be overcome; the great object is to check the fermentation, so that acetic acid be not formed. If any of your correspondents will let us know how this is to be effected, they will confer a real benefit upon your readers generally, for nothing can be more injurious to the stomach than the constant use of drinks strongly impregnated with alkalies, more particularly lime. Last spring, myself and several others had our beer rendered extremely acid by lightning. Is there any method of preventing this? I brew 4 bushels to the hhd., and 1 lb. of Hops to the bushel of Malt; it is well boiled, well fermented, and put into half-hhd. casks, perfectly sweet, and a small quantity of new Hops and sand, by way of fining, is added to each cask when the beer becomes still; the cellar is under ground. Notwithstanding, the beer always becomes more or less acid within three months. It appears to me that perfectly sound beer is rarely, if ever, to be met with."

BARLEY: *Alpha.* Give it them gradually, beginning with half a bushel a day, to your 80 sheep. One bushel to that number is a full allowance.

BONES: *E F L.* We should prefer mixing the soot with the bones *after* they were dissolved.

BONES AND ACID: *H W.* Prepare some water-tight basin, you can do so with puddled clay out of doors; let it be a foot deep, and as large as your bones require. Soak the bones well, and then pour one-third their weight of acid over them; turn it over and over, and in a day or two cover all over with ashes; in a fortnight mix all up.

CARCASES: *R E.* The most rapid way to effect decomposition is to mix with something already decomposing. Chop the flesh up, and lay it in alternate beds with hot stable manure, and cover over with vegetable mould, burnt earth, or charred stuff of any kind; any of these will detain the effluvia.

COTTAGE CHIMNEYS: *M P* may inquire of Mr. Allan, Epsom, Surrey, who will readily give him very valuable instruction, that gentleman having made the attainable comforts of the poor his peculiar study.

CYCLOPÆDIA: *J Parsons.* Your letter has been forwarded to Dr. Playfair.

DAIRY PRODUCE: *W M.* A cow will yield from one pound of butter a day upwards, according to size, age, food, season, time of calving, breed, constitution, and health. So many are the circumstances which often render a direct answer to a direct question in farming impossible. Ayrshire cows have been found to yield a considerably larger quantity of much poorer milk than those of Kerry.

FEEDING SHEEP: *Constant Reader.* Give 8 lbs. apiece of Swedes or Mangold Wurzel at 6 A.M.; ½ lb. to 1 lb. of meal, in 2 lbs. of hay chaff, at 10 A.M.; 6 lbs. of Swedes at 1 P.M, and 8 lbs. of Swedes at night. That will feed large sheep. If they will not eat all, clean out the troughs before next feeding time, and give less next time.

GIANT SAINTFOIN: *E N N.* It will thrive on a light dry gravelly soil. Sow 2 bushels per acre and cut three times in a season, for fodder. You must sow it by itself, not with any Rye-grass. Drill it across the young Wheat plant.

GRASSES: *Old Troublesome* might apply to Lawson, Edinburgh, stating the circumstances of the case. Our answer to his question would be a quotation from Lawson's book: and he will get seeds and advice together from the original source, by applying as we suggest above.

GUILLOTINE CHAFF-CUTTER: *S W.* Thanks. The true address is Mr. Gillett, Brailes, Shipston-on-Stour, Worcestershire.

HAY: *A Constant Subscriber.* We have seen, in the bottom of a large rick, old hay that weighed 3 cwt. per cubic yard, but one-half of this is the more ordinary weight, and in measuring a rick of common shape, all above the eaves goes for nothing, or rather, to compensate for the less density of the upper part of what *is* measured.

HYBRID MAIZE: *Mr. Saville* should apply to Mr. Glendinning at the Garden.

LIQUID MANURE: *Constant Reader.* It is a subject on which we want experience. Cannot Mr. Dickenson or Mr. M'Culloch tell us the means and their cost by which they water their Grass? The immense labour of carrying out the weight of dilute liquid from yard tanks made us give up the practice long ago. We now box-feed our cattle: and we use litter enough to absorb the urine; and the best way is to keep as little dung as possible in the open yard, to fill your tank with charred stuff, and pump from the bottom of it to waste, clearing it out now and then, and using the stuff in the dung-heap.

RYE-GRASS: *W H., Cork.* Lolium *perenne*, with all its varieties, is perennial. But some Rye-grasses are not included in this species, for instance, Italian Rye-grass is a biennial.

SMALL FARMS: *X Y Z.* Your recommendations as to saving manure are, of course, right, and lie at the foundation of the improvement desired. Among the intermediate steps are drainage (if required), to make the manure applied available for the plants, and the employment of good animals, to convert the food into meat for sale or consumption.

SUNDRIES: *Urban.* Four or five inches is a deep enough furrow after sheep have been folded on Turnips. Clover will ultimately fail it taken every fourth year. Take Beans every eighth year, or sow Trifolium incarnatum now and then, or alter your rotation to a six years' course.—Can any one tell us the average cost and profit per annum from an Alderney cow?

SWEDES, &c.: *A A.* Matson's, for places where the plant will run to leaf; Laing's, for early sowing; Fettercairn, for hard flesh; Skirving's for weight of produce. The Ashcroft is spoken of as a distinct sort: we do not know it. We are not aware that Dickenson's is a distinct variety of Italian Rye-grass. Mr. Rodwell, who has written on the subject in the English Agricultural Journal, professes to have selected distinct varieties.

TITHE: *G B S.* Your question is not clearly put. Given the tithe, as originally commuted (a), the value for any year (m) as calculated from the averages, of 100*l.* of the original rent-charge, then your tithe for any year is $\frac{a \times m}{100}$

YOUNG CHICKS: *Rus* says: "Some young chickens which had been fed on egg and Rice [eggs boiled hard? Rice unboiled?], fell sick with a disease which caused their crops to feel quite hard. They were found, on being opened, to be full of water. How should they have been treated?" No doubt improper diet caused indigestion and produced fever—fever urged them to slake ther excessive thirst, and the surplus liquid thus imbibed may have filled up the air-cells, which abound among the abdominal viscera—dropsy was the consequence. These complaints are very common, not only among the young but also adult fowls. See "D. S. E.'s" articles on Diseases of Poultry and their cure. Prevention is the only true method, as regards young chickens.

WHEAT AFTER BARLEY: *A A Laicus.* It is not so likely that Barley leaves what is injurious to Wheat, as that it takes what would have benefited it. Barley too is sown generally on soils whose texture is not favourable to Wheat culture. Wheat may be sown in rows 12 inches apart, and if you get the true *Triticum æstivum*, the end of March is not too late. It is bad farming to sow Wheat after Barley. Peas of an early sort will ripen perfectly though sown so late as the end of April.

WORKS ON NEW ZEALAND: *T T* kindly replies to an inquiry on this subject:—I wish to assist "Henry" in his inquiries; but first I would premise that the resources of that country are being so rapidly developed, under the excellent Governor and the exemplary Bishop of the colony, that books written only a year or two ago cannot be depended upon for particulars

relating to the actual condition of different settlements, but must be consulted chiefly in reference to the climate, soil, and permanent features of the country. If your correspondent is a churchman, he will feel great interest in the Canterbury settlement, and he would do well to call at No. 1A, Adelphi-terrace, where some of the gentlemen intending to emigrate as founders of the settlement meet daily from 10 till 5 o'clock, where also Mr. Alfred Wills, who has been during seven years officially employed on surveys in the southern province of New Zealand, attends daily. Here an emigrant would obtain that oral information from those most interested in that settlement at least, and the most recent accounts, which are more real than anything which books can afford. The Canterbury papers, too, published occasionally by Parker, West Strand, contain all the most recent particulars of that colony. For New Zealand in general we have "Adventures in New Zealand from 1839 to 1844," by Jerningham Wakefield, 2 vols. 8vo. "Handbook for New Zealand," by a late Magistrate, who resided four years; 1 vol., Parker, 1849. "Handbook for the Southern Settlements," by G. P. Eurp, member of the Legislative Council. "Travels in New Zealand," by Dr. Dieffenbach; Murray, 1843. "View of the Art of Colonisation, in letters between a Statesman and a Colonist," by E. G. Wakefield. (This is a book on colonisation generally.) "An Account of the Settlement of New Plymouth, from a residence of five years," by Hursthouse. "Journals of the Bishop of New Zealand's Visitation Tours," published in five sixpenny or shilling parts by Rivington. "New Zealand: sketches in Pen and Pencil," by Tyrone Power; the latter part of this volume—the first part being occupied with the campaign against the natives. "A Map of New Zealand, with enlarged plans of Port Nicholson, Wellington, Nelson, New Plymouth, and Otaga," advertised in Saunders's Catalogue of Recent Publications on Colonisation. The "New Zealand Journal" is published every alternate Saturday, and contains all the news and events affecting the island.—Perhaps the above list may not be without use to others of your readers; for if colonial legislation be once placed on a good footing, it cannot be doubted that the next 10 years will witness an astonishing emigration to lands where the advantages of abundance and comfort, a delightful climate, a civilised native population, religious ordinances, and educational institutions, are combined in a greater degree than in any other colony in the British dominions. *T. T.*

*** Communications reaching town after Wednesday cannot be answered the same week.

Markets.

COVENT GARDEN, Feb. 16.

The favourable change in the weather has made Vegetables plentiful, but many kinds of Fruit are scarce. Hothouse Grapes are over for a season, and Pine-apples are anything but plentiful, as are also Pears and Apples. Filberts, Walnuts, and Chestnuts are abundant, and Oranges and Lemons are sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some fine Cornwall Broccoli in the market. Potatoes are unaltered since our last account; foreign ones fetch from 50s. to 70s. a ton. Lettuces and other salading are cheaper, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb may be obtained. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Christmas Roses, Azaleas, Lilacs, Lily of the Valley, Epacrises, Acacias, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 9s	Almonds, per peck, 6s
Grapes, Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 6s to 10s	Walnuts, p. 100, 1s 6d to 2s
Apples, kitchen, p. bsh., 4s to 6s	— p. bush., 16s to 24s
Lemons, per doz., 1s to 2s	Filberts, per 100 lbs., 60s to 65s
— per 100, 6s to 12s	Nuts, Bar., p. bush., 20s to 22s
Oranges, per doz., 9d to 1s 6d	— Brazil, p. bsh., 12s to 16s
Oranges, per 100, 5s to 12s	Kent Cobs, 65s to 75s p. 100 lbs

VEGETABLES.

French Beans, p. 100, 2s 6d to 3s	Carrots, per bun., 4d to 6d
Seakale, per punnet, 1s to 2s	Spinach p. sieve, 2s to 3s
Asparagus, p. bund., 1s 6d to 6s	Onions, p. bushel, 2s to 3s 6d
Rhubarb, p. bundle, 6d to 1s	— Spanish, p. doz., 1s 6d to 4s
Savoys, per doz., 6d to 9d	Shallots, per lb., 4d to 8d
Cauliflowers, p. doz., 1s to 4s	Garlic, per lb., 4d to 8d
Broccoli, p. doz. bundl., 8s to 12s	Lettuce, Cab., p. sc., 4d to 9d
Greens, per doz., 2s to 3s	Endive, per score, 1s 6d to 4s
Brussels Sprouts, p. hf. sieve, 1s 6d to 2s	Mushrooms, p. pot., 9d to 1s 3d
Sorrel, p. hf. sieve, 1s to 2s	Small Salads, per punnet, 2d to 3d
Potatoes, per ton, 60s to 120s	Watercress, p. 12 bun., 6d to 9d
— per cwt., 3s to 7s	Fennel, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Savory, per bunch, 2d to 3d
Turnips, p. doz. bun., 1s 6d to 2s 6d	Thyme, per bunch, 2d to 3d
Red Beet, per doz., 9d to 1s	Parsley, p. doz. bun., 2s to 3s
Horse Radish, p. bdl., 1s to 4s	— Roots, p. bdle., 1s to 1s
Cucumbers, each, 3s to 5s	Marjoram, per bunch, 2d
Leeks, per bunch, 1d to 1½d	Mint, per bunch, 9d to 1s
Celery, p. bundle, 8d to 1s 6d	Corn Salad, p. hf. sieve, 9d to 1s

SMITHFIELD, Monday, Feb. 11.

The number of Beasts is rather smaller, and the average quality scarcely so good as on Monday last. Consequently choicest kinds are freely sold, but trade is dull for second-rate, of which some remain unsold. The supply of Sheep continues to be short; they are rather more in demand, and in a few instances a little more money is given, but on the average prices cannot be quoted higher. Calves are still scarce and quite as dear. Trade is very heavy for Pigs, and prices are low. From Holland and Germany we have 100 Beasts and 16 Calves; from France, 6 Beasts and 100 Sheep; from Scotland, 300 Beasts; from Norfolk and Suffolk, 2300; and 200 from the midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	8	to 3	10
Best Short-horns	3	6	— 3	8
2d quality Beasts	2	8	— 3	4
Best Downs and Half-breds	4	0	— 4	4
Ditto Shorn				

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	8	to 3	10
Ditto Shorn				
Ewes & 2d quality	2	10	— 3	4
Ditto Shorn				
Lambs				
Calves	4	0	— 4	10
Pigs	3	0	— 4	0

Beasts, 3416; Sheep and Lambs, 16,390; Calves, 63; Pigs, 195.

Friday, Feb. 15.

The number of Beasts is not very large, but it exceeds the demand. As is usual at the commencement of Lent, trade is very heavy. On the average prices are lower, and several remain unsold. The supply of Sheep, although not large, is a fair average for the time of year; however, the stock on hand being small, they are freely sold at rather higher rates. Calves are more plentiful; in consequence prices are fully 4d. per 8 lbs. lower for best kinds, and a still larger reduction is submitted to for inferior quality. Trade is heavy for Pigs. Foreign supply consists of 139 Beasts, 80 Sheep, and 75 Calves. The number of Milch Cows is 126.

Best Scots, Herefords, &c.	3	6	to 3	10
Best Short-horns	3	4	— 3	8
2d quality Beasts	2	6	— 3	2
Best Downs and Half-breds	4	2	— 4	6
Ditto Shorn				

Best Long-wools	3	8	to 4	0
Ditto Shorn				
Ewes & 2d quality	3	0	— 3	6
Ditto Shorn				
Lambs				
Calves	3	8	— 4	10
Pigs	3	4	— 4	0

Beasts, 862; Sheep and Lambs, 2750; Calves, 205; Pigs, 190.

Hops.—Friday, Feb. 15.

Messrs. Pattenden and Smith report that the market is in a very quiet state, at late prices.

ENGLISH TIMBER AND BARK.—Feb. 16.

	Round Timber, Per Load.	Plank, Per Foot Cube.	Inch Board, Per Foot Superf.
Oak	£5 10 0 to £8 0 0	3s. 0d. to 5s. 0d.	0s. 4½d. to 0s. 6d.
Ash	4 10 0 — 6 0 0	2 3 — 3 3	0 3 — 0 4

POTATOES.—Southwark, Feb. 11.

The Committee report that the arrivals during the last week coastwise have been limited, notwithstanding which trade is heavy, and it with difficulty the following quotations are supported, in consequence of the very heavy supply per rail.:—Yorkshire Regents, 90s. to 120s. per ton; Wisbeach do., 70s. to 100s.; Scotch do., 70s. to 80s.; Scotch cups, 60s. to 70s.; French whites, 70s. to 80s.; Belgian do., 65s. to 75s.

MARK LANE.

Monday, Feb. 11.—The supply of Wheat by land carriage samples this morning being small it was realised at fully the prices of this day se'nnight; foreign also met an improved inquiry, but being held above the buyers' ideas, only a limited business was transacted.—We observe no alteration in the value of Barley, Beans, or Peas.—Oats meet a slow sale at our last week's quotations.

Friday, Feb. 15.—The arrivals of grain of all kinds during the week have been small. This day's market was but moderately attended, and the business transacted was quite of a retail character; we observe no alteration in the value of any description of Corn.—Flour continues difficult of sale.—Floating cargoes of Galatz Indian Corn are offered at 28s. 6d. per quarter.—During the week a firmer feeling has prevailed in the corn trade throughout the kingdom, and in some instances a slight improvement in the value of Wheat has been established. In the Baltic diminished supplies and the general opinion of the safety of present prices have prevented any decline of moment in the value of grain there. In Antwerp large arrivals were looked for, and it was expected that 62 lbs. Louvain Wheat would decline to 36s. 6d. per qr., f.o.b. In the French markets quotations continue unaltered.

Arrivals this week.

Liverpool, Tuesday, Feb. 12.—The last week's arrivals of grain, meal, and flour are upon a very limited scale, but at the same time the general demand has been without animation, and there has been no observable alteration in prices. At this day's market there was a fair attendance of millers and dealers, but their operations were confined to mere retail purchases of Wheat and Flour, at similar rates to those paid on this day se'nnight. Oats were ½d. per bushel lower. In a few instances 3d. to 6d. per qr. reduction was submitted to on Indian Corn, but, on the whole, a fair quantity was taken by Irish buyers, and the decline was not general. Barley and Peas were dull, and unchanged in value. Egyptian Beans declined 6d. to 1s. per quarter.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in The Gardeners' Chronicle of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. Hartleys, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Sales by Auction.

MESSRS. LODDIGES' CELEBRATED ARBORETUM FOR SALE BY AUCTION.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.

MR. J. C. STEVENS is favoured with instructions from Messrs. LODDIGES, of Hackney, to submit for unreserved competition, on the premises, on MONDAY, 4th March, and five following days, at 12 for 1 o'clock, in consequence of the decease of the Senior Partner, the FIRST PORTION OF THEIR UNRIVALLED ARBORETUM, comprising many thousand well-grown specimens of the rarest and most beautiful Trees and Shrubs, affording to noblemen and gentlemen engaged in Ornamental Planting an opportunity which has never before occurred.—Catalogues are preparing, and will be ready for delivery 10 days prior to the sale, on the premises, and of Mr. J. C. STEVENS, 38, King-st., Covent-garden, London.

AMERICAN PLANTS.

MR. J. C. STEVENS begs to notify that two days of the Sale at Messrs. LODDIGES will be devoted entirely to the American Plants, which comprise Azaleas full of flower-buds and well adapted for forcing, Kalmias, Andromedas, Ledums, &c.

TO NOBLEMEN AND GENTLEMEN ENGAGED IN ORNAMENTAL PLANTING, AND THE TRADE.

A large parcel of Araucaria imbricata, and Cedrus Deodara, two of the most noble Ornamental Trees ever introduced into Europe, and a few other hardy Coniferæ.

MR. J. C. STEVENS is directed to sell by Auction, at his Great Room, 38, King-street, Covent-garden, on THURSDAY, Feb. 21, at 11 for 12 o'clock precisely, 1100 Cedrus Deodara, 1 to 2 feet; 500 Araucaria imbricata, 1 foot to 18 inches; 12 fine specimens of Taxodium sempervirens, from 5 to 8 feet, and 100 strong plants 18 inches; 10 Taxodium pinnatum; 25 Pinus patula; 100 Cupressus torulosus; and 6 Gordon Island Cypress.—May be viewed the day prior and morning of sale, and Catalogues had (by enclosing a penny stamp) of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

EAST INDIAN ORCHIDS OF THE GREATEST RARITY.

MR. J. C. STEVENS is instructed to sell by Auction, at his Great Room, 38, King-street, Covent Garden, on TUESDAY, Feb. 26, at 12 for 1 o'clock precisely, an importation just received from CENTRAL INDIA, and well deserving the attention of Orchid growers, as it comprises a most remarkable new Cælogyne with erect panicles of flowers 3 inches in diameter, Cælogyne maculata also a new and beautiful species, C. cristata, C. Wallichiana, Dendrobium Farmerii (true), D. Devonianum, D. Gibsonii, D. Dalhousianum, D. Cambridgeanum, D. Griffithianum, and several new and distinct species of Dendrobium, a splendid new Cymbidium with erect flower stems 2 feet in length, and other novelties and rarities, in the finest order.—May be viewed on the morning of Sale and Catalogues had.

MR. HASLAM will sell by Auction, at the Auction Mart, on THURSDAY, Feb. 21, and FRIDAY, Feb. 22, 300 Camellias, beautifully set with opening bloom, Azalea indica, Orange-trees, &c. Also, an extensive collection of Yellow and other Picotees, Carnations, Pansies, and Herbaceous Plants, cultivated by Mr. Thomas, of Greenwich, an importation of Flower Seeds, some Weeping and other Roses, &c.—Catalogues may be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping, Essex.

IMPORTANT SALE OF CAMELLIAS, ROSES, LILIUMS, &c.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, at the Auction Mart, Bartholomew-lane, on THURSDAY, March 7, 1850, and following day, at 12 o'clock each day, about 600 Double Camellias, from 18 inches to 10 feet, beautifully furnished with bloom buds, 200 Strong Camellia Stocks, also 400 Standard and Dwarf Roses, consisting of Noisettes, Hybrids, Bourbons, Perpetuals, &c.; a fine collection of American Plants, comprising Ghent and other Azaleas, Andromeda Floribunda, Magnolias, &c.; 200 strong bulbs of Lilium Lancifolium Album, Speciosum, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BROMPTON-PARK NURSERY, KENSINGTON.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. John Sangster, and Mr. Robert Donald, trustees for the above estate, to submit to an unreserved sale by Auction, on the premises, Brompton park Nursery, Kensington-road, Middlesex, on MONDAY, February 25th, and following days, at 11 o'clock each day, the whole of the remaining and valuable NURSERY STOCK, consisting of the well known celebrated collection of Standard, Dwarf, Maiden, and Trained Fruit Trees, and a rich assortment of Evergreens, Deciduous Shrubs, and Ornamental Trees; together with the Greenhouses, fitted up with new and improved Hot-water Apparatus, Pits, Frames, Carts, and Utensils; also a few Seeds.—May be viewed prior to the sale. Catalogues (1s each, returnable to purchasers) may be had of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. If sent by post, 1s. 6d. each.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. John Smith, to submit to public competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, March 11, and following day, at 11 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the valuable NURSERY STOCK, consisting of a very superior assortment of large Evergreens, American Plants, Ornamental Trees, and Deciduous Shrubs, Fruit and Forest Trees in great variety, fine Ivies, Roses in pots, &c.—May be viewed prior to the sale. Catalogues may be had, 6d. each (returnable to purchasers), on the premises; the Shop, Covent-garden; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. PILE will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, next, at 12 o'clock, 50 lots Standard Roses, 5 or 6 lbs. German Stock (24 varieties), 3 or 4 lbs. German Aster (16 varieties). Fifty other remainders of choice seeds, some hundreds of the scarce and beautiful White Turban Ranunculus (selling freely at 1s. each), Ditto Yellow Turban, and named varieties, Anemones, sundry Bulbs, Roots, and Effects, the remaining Stock of a retiring Florist, obliged to make a clearance—Catalogues on Tuesday of Mr. PILE, at the Mart, and at the Offices of the Gardeners' Journal, *Gardeners' Chronicle*, and the Country Gentleman.

TO GENTLEMEN, FLORISTS, AND OTHERS.

THE STOCK OF A FLORIST.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde Park Corner), on WEDNESDAY, Feb. 20, 1850, at 12 o'clock precisely, without reserve, a quantity of large specimens of Camellia, Erica, Azalea indica, Acacia armata, Epacris, &c.; with 1500 Greenhouse Plants, in choice variety, comprising Camellia, Oleander, Epacris, Azalea, Crassula, Correæa, Cytissus, and other Plants in bloom; and also 300 Standard and Dwarf Roses.—May be viewed on the morning of Sale, and Catalogues had of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

TO MARKET GARDENERS AND OTHERS.

TO BE LET, three miles from Hyde-Park Corner, 16 acres of Garden Ground, with Dwelling-house, Stable, Storehouse, and Out-buildings. May be entered upon immediately.—For particulars, apply to Mr. BURFIELD, 180, Strand, London.

STEAM FLOUR MILLS.

TO BE LET, a very substantial, complete, and newly erected STEAM FLOUR MILL, with spacious Stores and every convenience. The Mill is in full work, and turning out 500 or 600 sacks weekly; has a good connexion; is situate in a port of the English Channel, close to the public quay; dues only 3d. per ton on exports and imports. There are eight pairs of excellent Stones; the Engines, 25 horse-power, erected in 1848 by Wentworth and Sons, of London, nad the whole plant in first-rate order.—For further particulars, apply by letter (prepaid), to J. C., Messrs. Mudie and Sons, News Agents, 15, Coventry-street, London.

TO BE LET, a Sound and Compact STOCK FARM, containing 346 acres of Arable Land, in Hampshire, well situate for Markets and Roads, with possession now or at Michaelmas next. Term, if desired, 20 years.—Apply to LAMB, BROOKS, SON, and CHALLIS, Solicitors, Basingstoke, or Odiham, Hampshire.

TO BE LET, for a term of 7, 14, or 21 years, and entered upon immediately, NORTHFLEET GREEN FARM, situate in the parish of Northfleet, Kent, containing 136 acres (more or less) of superior, dry, Arable and Hop Land, with suitable Dwelling-house and Agricultural Buildings. The incoming tenant will enter without valuation.—For particulars apply to WALTER D. JONES, Esq., Lancyck, near Newcastle Emlyn, Wales; and, to view the Farm, to J. BEENCHLEY, Esq., Wombwell-hall, near Gravesend, Kent.

TO BE SOLD, OR LET, under peculiar circumstances, and upon very advantageous terms, a series of Forcing and Succession GRAPERIES, PEACH and PLANT HOUSES, upon which a large sum has been expended to bring them into a high state of bearing. To a purchaser, any reasonable accommodation will be given for payment.—Apply to Mr. PARSONS, Auctioneer and Estate Agent, 30, Marine-parade, Brighton.

TO GENTLEMEN, AGRICULTURISTS, &c.

TO BE SOLD, a New, Powerful, and Handsome WINDMILL, with 18 feet sweep, and spring shutters, admirably adapted for raising water, chaff cutting, and general agricultural purposes, and would be an ornament to any part of an estate. May be seen, or further particulars obtained, by applying to W. NASH, Builder, &c., Ball's-pond, Islington, near the church.

CROSSKILL'S PRIZE AGRICULTURAL IMPLEMENTS, kept in stock for delivery from Hull to London, Southampton, Bristol, Liverpool, Leith, and all parts of the Kingdom. On receipt of six penny stamps, a *new* Illustrated Catalogue of CROSSKILL'S Field, Road, and Barn Implements of the newest and best construction, will be sent *gratis per post*. The new prize portable Farm Railway is expressly and admirably adapted for agricultural purposes, and will pay its cost the first year.

Address—Mr. CROSSKILL, Iron Works, Beverley.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses when completed charged from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; one principle, the roof being formed without wood or putty, and the other principle being wood rafters and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per ft.

HEATING BY HOT WATER.

FLEXIBLE HOSE PIPES.

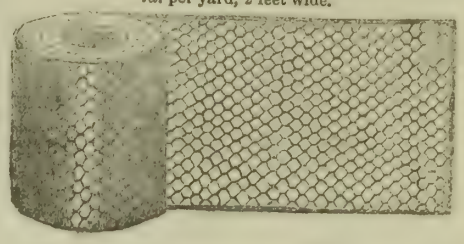
JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. Hot Liquors or Acids do not injure them. In all temperatures they are permanently flexible, and are well adapted for Breweries, watering Gardens, Liquid Manure Pumps, Gas Fittings, and Chemical purposes. No oil or dressing is required in using them. They NEVER LEAK from remaining out of use, and are therefore particularly suitable for Fire-Engines, and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—GARDEN AND LIQUID MANURE HOSE, fitted with Branches, Roses, and Jets, complete, with Union Joints, to attach the Hose to Pumps or Water Cisterns.

All letters or Orders addressed to the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

FRUIT TREES, FLOWER-BEDS, &c.—Garden Netting, of superior quality, for preserving Fruit trees from frost, blight, and birds, or as a fence for rabbits, fowls, pigeons, Tulip and Seed beds, can be had in any length or quantity at 3d. per yard 2 yards wide, or 6d. per yard 4 yards wide, from JOHN KING FARLOWS, Fishing Rod and Net Manufactory, 5, Crooked-lane, London-bridge. The netting being tanned will stand exposure to the weather for many years. Forwarded to any part of the kingdom on receipt of post-office order, or reference in town. An allowance to gardeners and large consumers.—Copy the Address, 5, Crooked-lane, London-bridge.

CORN MANURE.



BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, prepared from the nitrogenous matter deposited on the banks of the Thames, in combination with other substances essential for the growth of corn, &c., price 8l. per ton. Sold, in a finely ground state, at No. 3, New London-street, Mark-lane; also, at the Works, Mill-wall, Poplar; Waterloo Dock, Lambeth; and No. 1, Praed-street, Paddington Basin.

PATENT COPROS, for Corn crops, also for Turnips, &c.; Superphosphate of Lime, Gypsum, calcined and saturated with liquid manure. CEMENT for Liquid Manure Tanks, Malt House Floors, and Barn-floors, manufactured by J. M. BLASHFIELD, successor to Wyatt Parker and Co., Original Patentees—Parker's Cement. Established 1796. Drain Pipes, Tiles, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, February 16.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7d. per yd.	5d. per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.
